"Spon's Architects' and Builders' Price-Book: 1903." By W. Young. Edited by Clyde Young, A.R.I B.A. Price 3s. 6d. London: E. & F. N. Spon, Ltd., 125, Strand, W.C.

A new Method of Perspective.

On p. 401 of our issue for January 28th last we gave particulars of this new method of preparing drawings in perspective, in reviewing the published small-scale diagrams, and then had occasion to announce that Mr. B. T. Batsford would publish large diagrams for office use. These have now made their appearance and are excellently prepared, so that they should be of the greatest service to many architects. They are in half-imperial size and are drawn to ½in. scale; thus each height space represents 6in. and each width a foot. The diagrams are printed on transparent paper, to allow them to be reversed if desired. It may occur to many that an objection to their use is that thick drawing papers when laid over them will obscure the diagrams, but this can be overcome by placing the paper and diagram over a sheet of glass tilted at an angle, when the lines can be observed through the thickest drawing paper. We are glad to learn that this publication is proving a great success.

R.'s Method: Perspective at Sight: Diagrams for Half-Imperial Perspectives. London: B. T. Batsford, 94, High Holborn, W.C. Price, 7s. nett.

Hertfordshire.

The chief difficulty of the author of this little volume was to compress all he had to say—and "scrappiness" is the result. Still, he has given us what may be called a concise synopsis of Hertfordshire. There are many architectural references, and to illustrate the author's taste in these matters we quote what he says when speaking of the Hall at Panshanger: "Panshanger is not a 'correct' structure from an architectural standpoint; the writer of Murray's Handbook describes it well as a 'stucco-fronted, semi-castellated Gothic mansion of the Walpole-Wyatt type.' Most ramblers, however, are not architects, and the mansion and its surroundings are, as a whole, as picturesque as they can well be." Of New Barnet he says: "The whole of the district is excellent ground for the student of modern domestic architecture, the examples of diverse schools and styles being endless." In the chapter on Antiquities a complete list of the old churches of the county is included (classified according to their respective styles), fuller details of each being given in the chapters relating to their special districts. The history and description of St. Albans Abbey is written in a free and unbiased manner, and in his remarks on the restoration the author is careful to avoid any expression of opinion as to its merits or otherwise. Hatfield House, Knebworth Hall, Moor Park (Rickmansworth), St. Peter's Church (St. Albans), Berkhampstead Church and Waltham Cross are among the more important structures which are accorded special notice. A passing mention is made of the Great Northern Viaduct at Welwyn; (one of the finest in the country); but in the list of modern churches at Watford no mention is made of the Church of the Holy Rood, and but a line is given to Beechen Grove Chapel. The description of Berkhampstead contains no reference to Egerton House, a decided omission, and there is but a meagre paragraph about Ashridge House. Otherwise the many country residences, famous old inns and houses with which Hertfordshire abounds are duly noticed. Besides the ordinary map, a very clear and accurate sketch map is given. Mr. New's illustrations are not remarkable; he has done better work than this.

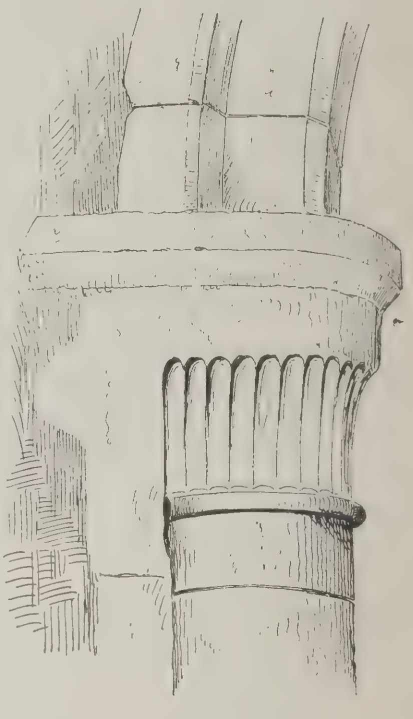

FIG. 6—WEST RESPOND OF SOUTH ARCADE.

"Hertfordshire," by Herbert W. Tompkins, F.R.H.S. with illustrations by Edmund H. New. London: Methuen & Co, 36, Essex Street, Strand, W.C. Price, cloth 3s., leather 3s. 6d.

Timbers.

This is a very useful book by an authority on the subject of timber. It first speaks of wood in general, dealing with its origin and structure, with short chapters on the classification of woods, defects, selection, seasoning, &c. The remainder of the book, more than half and by far the most useful, is devoted to short descriptions of the woods of commerce, particularizing their sources, characteristics and uses. We regret that the preliminary chapter is so concentrated and involved, and the sentences often so ambiguous as to be most wearisome to read. There is no necessity for this; and the author would do well to remedy the defect in a second edition.

"Wood: A manual of the Natural History and Industrial Applications of the Timbers of Commerce," by G. S. Boulger, F.L.S., F.G.S., F.R.S., F.R.H.S., A.S.I., Professor of Botany in the City of London College. London: Edward Arnold, 37, Bedford Street, Strand W.C. Price 7s. 6d. nett.

ARCHITECTURE AT THE ROYAL ACADEMY.

OF the 250 exhibits in the Architectural Room at the Royal Academy practically one-half are of domestic work, and there is cause for congratulation that this work is so satisfactory. Even among the smallest houses, done in some cases by quite young men, one sees a soberness which is altogether acceptable after the rinsings of the Gothic Revival—houses that would weather well and be comfortable to live in: while the large exhibits include mansions where the abundance of money has not resulted in a gorge of ornament but in a classic richness and solidity. The additions which have been made to Cornbury Park, Oxfordshire, by Mr. John Belcher are in admirable taste. The work is very refined in feeling, and is worthy to be considered as among the best of Mr. Belcher's many mansions. The drawings themselves are excellent. Let the carefully-drawn elevation (No. 1455) be compared, for instance, with the pencil perspective of Dalham Hall below, by Messrs. Mallows & Grocock: even allowing that the latter is drawn hurriedly, one can see it was done for effect—with the result that we are quite unable to get an exact impression of the window treatment and other details. Another of Mr. Belcher's exhibits (No. 1448) shows his remodelling of Tapeley Park, Instow, North Devon. Here again we might trace its origin were there no name on it. The house is of the English Renaissance type, rather of the Georgian period, of red brick with lighter brick arches over some of the windows and stone pilasters—those on the south front and the columns over the portico seem rather slight, but the house is a fine piece of work as a whole.

Burton Hall, in Cheshire, is another large country mansion of which Messrs. Nicholson and Corlette are the architects: the design is strong but the drawing (No. 1530) is too splotchy to be able to see all the parts as one should.

Crathorne Hall, Yarm-on-Tees, is a well-designed house by Messrs. Ernest George & Yeates, the drawing (No. 1444) washed over with sepia in their characteristic manner. The house has a big hall on the terrace front with a large dining- and morning-room on either side, a corridor behind running the whole length of the house and leading at one end to the servants' quarters, which are ranged around an inner courtyard. The elevations are very pleasing.

Mr. E. Guy Dawber exhibits three drawings, all good specimens of penmanship. Two (Nos. 1647 and 1657) are respectively of the garden and entrance fronts to Nether Swell Manor, Gloucestershire, a county where he has already done so much work; while the third (No. 1637) is of Juniper Hill, Surrey (to be reproduced in our centre plates next week). All three are well treated.

The entrance front to the house at Winchfield (No. 1648) is much the same in treatment as the garden front exhibited by Mr. Ernest Newton last year, and which was reproduced in our issue for August 27th, 1902—anyone who has seen Mr. Newton's houses as built will especially appreciate the drawings of them which he exhibits.

The music-room at Hatchlands, Guildford, by Mr. Reginald Blomfield (No. 1652) is one of the best exhibits among the domestic work in the room. The carving is very rich and the treatment altogether in that style of English Renaissance which Mr. Blomfield so boldly practises.

Thorpe Underwood Hall, Yorks, is shown by an effective drawing by Mr. Griggs (No. 1477). The house itself, designed by Mr. Walter H. Brierley, is well planned and the elevation pleasing.

Mr. Leonard Stokes shows the drawing of Littleshaw, Woldingham, reproduced in our issue for August 13th, 1902; Mr. William Flockhart a sketch of the hall at Park Wood, Henley-on-Thames (No. 1535), in the English baronial manner, with large hood over the fireplace and exposed ceiling timbers; and Mr. Clyde Young the entrance-hall to Elveden (No. 1593), a fine domed ceiling, with semicircular lunettes, supported on dark-green marble columns.

Cripland Court, Sussex, by Messrs. T. H. Mawson and P. Morley Horder (No. 1492), was illustrated in our issue for July 9th, 1902; the pond garden at Biddenham, by Messrs. Mallows and Grocock (No. 1474), in our issue for February 19th, 1902; the garden house and pergola at Walmer Lodge, Kent, by Mr. Thomas H. Mawson (No. 1570), in our issue for October 8th, 1902; the house at Lee-on-the-Solent, by Mr H. L. Fedden (No. 1596), in our issue for November 19th, 1902; and the drawing-room at Birkby Lodge, Huddersfield, by Mr. Edgar Wood (No. 1508), in our issue for May 21st, 1902.

Mr. Alfred H. Hart exhibits two drawings (Nos. 1493 & 1520) of a house on the Hadley Road, very picturesque on the garden front. Maesycrugian Manor, in Carmarthenshire, by Mr. Arnold Mitchell (No. 1490), has a great squat tower that bulks very heavily; and the same preponderance of a tower is to be found in the proposed house near Witley by Mr. Seth-Smith (No. 1576)—for the rest this latter house is in good proportion.

Mr. George O. Scorer's sketch for a house on the Isle of Wight (No. 1509) deserves mention as a specially pleasing design, and the same may be said of the two houses at Buckhurst Hill by Mr. A. Needham Wilson (No. 1557). Witham Hall, Lincolnshire, by Mr. A. N. Prentice (No. 1496), is another good design, though not so admirable as some of Mr. Prentice's other houses.

Among other domestic work we noticed some houses by Messrs. Cooper & Davis, more especially the house at Scarborough (No. 1567), a pleasing design with four round bays on the garden front—the drawings themselves most strangely coloured, even allowing for the setting sun which we assume to be in the neighbourhood; "The White Cottage," Sunningdale, by Mr. Campbell Jones (No. 1624); a house at Beckenham by Mr. Henry Tanner, junr. (No. 1630); a charming lodge at Enfield by Mr. Sidney W. Cranfield (No. 1631), far better than his cottage at Gough Park (No. 1638); a small house and garden at Windermere by Mr. Thomas H. Mawson (No. 1473), in his characteristic manner with a pergola walk at one side; a house at Farnham by Messrs. Niven, Wigglesworth & Falkner (No. 1482), with strange and fearful clouds in the sky; a sturdy design for a house at Cudham by Mr. William J. Davies (No. 1513); a country house by Mr. H. Lowry Corry (No. 1517); Holiday Cottage, Ditchling, by Messrs. F. H. Greenaway and J. E. Newberry (No. 1588); a house at Warlingham by Mr. William H. Harrison (No. 1608); stabling and fives-court at Ilkley by Mr. E. Brantwood Muff (No. 1642); and a cowhouse and farm at Shenley by Mr. C. J. Harold Cooper (No. 1676).

We noticed, too, among the interiors several "Arts and Crafts" designs, more particularly two of staircases by Mr. Shiner (Nos. 1533 and 1544); a dining-room by Mr. Ellwood (No. 1512), with something very strange over the fireplace; a dining-hall by Mr. Alec. D. Clark (No. 1595); two very pleasing inlaid fireplaces by Mr. Thomas Johnson (Nos. 1483 and 1498); and quite an "Art Nouveau" design for a drawing-room by Mr. Davit Whittet (No. 1541), with a huge pattern on the wall and immense firedogs.

Coming now to public and semi-public work, we see several drawings of very large buildings. First there is Mr. John Belcher's design (and also a model) for the Royal London Friendly Society's new offices on Finsbury Square (No. 1452), illustrated in our centre plates this week—a design which masses up well. Mr. Aston Webb shows a large drawing of the completion of the Victoria and Albert Museum at South Kensington (No. 1489), a well-arranged plan and carefully-treated elevation, though we do not think the central tower is altogether successful. Mr. Webb also exhibits a finely-drawn detail of one bay of the Royal College of Science at South Kensington (No. 1463).

A very remarkable design for the proposed new Government offices at Johannesburg is shown by Mr. Halsey Ricardo (No. 1453), consisting of a series of semi-circular arches springing from stout columns on the ground floor and carrying two storeys of projecting verandahs, which, as there is no balustrade, are presumably introduced to give shade only.

Messrs. Briggs, Wolstenholme, Hobbs & Thornley show an interior and exterior (Nos. 1686 and 1449) of the proposed Bluecoat Hospital Chapel at Liverpool, a sober design, though not striking; Mr. Henry T. Hare shows his design for new municipal buildings at Crewe (No. 1447), a building very characteristic of his methods, and also the Harrogate Municipal Buildings (No. 1499); and Mr. Edwin T. Hall a powerful design for a war memorial library at Dulwich College (No. 1545). Another war memorial to Old Cliftonians, by Mr. William L. Lucas (No. 1446), has a figure of Pallas very reminiscent of that by Sansovino on the now demolished portico to St. Mark's Campanile.

A fine perspective of the interior of the new Sessions House in Old Bailey is exhibited by Mr. Mountford (No. 1645).

Several competition designs are hung, such as those by Messrs. Lanchester, Stewart & Rickards for South Shields Town Hall and Deptford Town Hall (the latter was reproduced in our issue for October 22nd, 1902).

Of the scholastic buildings there are notably Mr. T. G. Jackson's design for new buildings at Hertford College, Oxford (No. 1640); King's Lynn Grammar School, by Mr. Basil Champneys (No. 1655); Board schools at Brighton, by Mr. John W. Simpson (No. 1667); and St. Felix Schools, Southwold, by Mr. Arnold Mitchell (No. 1459). Mr. H. Percy Adams exhibits a fine design for the Tunbridge Wells General Hospital (No. 1684).

Several good city business premises and blocks of flats are shown, as well as a coloured drawing of Prof. Beresford Pite's Pagani Restaurant (No. 1451), which is a daring design particularly successful above the ground floor. But, besides the domestic work and the few large public buildings mentioned, it is the church designs which merit special attention. Here we find quite a collection of Liverpool Cathedral drawings. Mr. Corlette shows two (Nos. 1670 and 1672), respectively an exterior and interior. The design, however, can only be considered moderate. Mr. Skipworth's design (Nos. 1677 and 1680) is remarkable; it has many good points, but we fear there is too much of the "individualistic" touch in it to be altogether successful. Prof. Beresford Pite's is a masterful design, far finer than Mr. Leonard Stokes's.

Mr. Charles H. Reilly exhibits two effective drawings (No. 1464 and 1507) of a cathedral. Mr. Bodley shows St. Mary's, Clumber, a diploma work deposited on his election as Academician (illustrated in our issue for April 22nd last); Mr. William H. Bidlake his fine Latimer Memorial Church at Birmingham (No. 1479), admirable in proportion; and Mr. C. Harrison Townsend a drawing of the beautiful pulpit he has designed for Bristol Cathedral, one of the best designs he has ever made.

Taken as a whole, the architectural room at the Academy this year is very creditable. But we should like to see a greater number of carefully-drawn elevations (such as Mr. Belcher's and Mr. Aston Webb's) and fewer perspectives; and—photographs, though the hope seems vain.

THE ARCHITECTURAL ASSOCIATION.

ARCHITECTURE AND THE PUBLIC.

A MEETING of the Architectural Association was held on Friday evening last, Mr. Henry T. Hare, F.R.I.B.A., presiding. The following were elected members:—Messrs. Robert Haensler, C. R. B. Murphy, J. P. White and George Hornblower. Mr. A. Needham Wilson then read a paper on "Architecture and the Public," of which the following is a summary:—

We have passed through many stirring influences. We underwent the ordeal of the æsthetic era in emerging from the Victorian—we had a severe attack of the "Queen Anne"—and recently we have suffered more or less from a strange disease known as the "New Art," from which we are scarcely convalescent. We have fortified our constitutions with the school of Norman Shaw. We have trembled in the throes of the Gothic revival and the influences of the Oxford Movement, and we have seen as the outcome a new and, I venture to think, a sturdy development of ecclesiastical architecture. And a greater appreciation of the Renaissance stock has encouraged the grafting of some vigorous shoots on that fine old tree.

Is it too picturesque or overdrawn to imagine English architecture as a giant awaked from sleep, and ready and anxious to battle successfully under the new conditions amidst which he finds himself; still stretching his powerful limbs and yawning a little?

If it be granted that we are living in a transitional age, and that the old order of things has passed away; that as a nation we are awaking to the knowledge that we can no longer plod along in our old stubborn way but must bestir ourselves, unless we would be left behind and unheeded in life's race, are we architects fully alive to the fact?

New inventions, new ideas, new demands, new conditions, new uses for materials, crowd upon us and increase daily. We have a differently constituted public to cater for, with an education which makes them infinitely more difficult to please than formerly, and yet have we succeeded in awakening generally a greater appreciation of the beautiful in art as far as we are concerned? Have we succeeded in more than meeting the demands of sanitary and constructional enlightenment? Are we leading or being led? Is architecture to-day an educational force calculated to elevate and teach and brighten the existence of the masses, or to relieve the dull grind and monotony of the great middle classes or the sordid and deadly dull existence of the workers? Are we as fully equipped for this position as we ought to be, or even alive to the necessity, or is it all the idle Utopian idea of the dreamer, and shall we meet it with the reply that it cannot be done at 5 per cent.?

Further, has the status of the architect at all improved, or is he still considered a visionary, an unpleasant necessity, or an unmitigated nuisance, whose services may be dispensed with if possible? Can he command, any more than before, the tribute to brains and genius ungrudgingly given to the successful painter or sculptor, or can he appeal to the popular imagination with the expression of those brains and genius as can the engineer? Have we an appreciative public—one that can recognize genius when it exists?

It can scarcely be claimed that we are artistic as a nation. Art with us is not spontaneously produced, it is rather the result of force effort; it is not the natural outcome of inherent liking—which will evolve art unconsciously without knowing that it is art. As a nation we do not produce art unconsciously, and as a nation we are not aware of the fact.

Yet I think even I can detect a growing appreciation of art, for art's sake, as expressed by the painter, the sculptor, and the craftsman, an appreciation that is gradually spreading, and even now with the public is supplanting what I may term the oleographic epoch. I hope I can detect signs of an appreciation of better things in domestic decoration, furniture and ornaments. Is it too optimistic to trust that the era of hideous flowered wallpapers, marble mantelpieces, grained woodwork, ugly mahogany, glass lustres, dyed grasses and wood mats, and their deadly dull atmosphere of sordid respectability is giving way to a craving for something better? The dull monotony of the struggle for existence is leading to a yearning for that which will brighten the grey and leaden hue of the lives of the great mass of the people. But we have not as yet succeeded in abolishing the deadly dreariness of the interminable streets of "villas"—long, wearisome vistas of endless monotony—the drab of which must be reflected in the lives of the unfortunates who dwell therein. Yet even the speculative builder caters for tenants with some approach to what he fondly imagines is art, finding that the "half-timber" is worth an additional £5 on the rent. Shall we see the day when these interminable rows of dwellings, ground out of the speculative builders' mill, will give place to cheery and well-designed groups of houses facing their common green quadrangle?

Well, I venture to assert, not until we architects have a hand in the matter. Not until we have succeeded in moulding the popular mind into a far greater appreciation of the beautiful as expressed in architecture; not until we have suppressed the prejudices against us, and created such a demand that it will be as natural to employ an architect as it is now for the builder to draw himself one set of plans for a hundred houses.

I venture to think that as architects we hardly grasp the importance of the influence of our work upon the social well-being of the people. Do we not design too much for ourselves and our self-gratification? I suggest that we count too much upon the solid insular reserve of the Briton, and too little upon the emotional side, which it is our national characteristic to repress. However dull, however hardened a man may be, surely he must be unconsciously influenced by his environments; and may I suggest in this we have a means of educating our fellow men to a fuller and healthy appreciation of our work.

Do we not see on every hand awakening knowledge and keener interest in our work? If only it all can be turned in the right direction, I venture to prophesy that no registration of architects will be necessary to protect the public against incompetent or unqualified men, but that the public will no more employ such men than they would an incompetent or unqualified lawyer.

Why, even the Press—not a bad barometer, by the way—has been reflecting the movement, and, when reporting upon the opening of a new building, has even illustrated it occasionally, and actually in some instances mentioned the name of the obscure individual who has conceived it and carried the work of his brain into concrete form.

We are perhaps too ready to dwell on our grievances against the public—sometimes real, sometimes imaginary—and into these I do not, as I said, propose to enter. But what I would ask is, Have the public any legitimate grievances against us?

The many-sided character of the profession shows no tendency to diminish, but rather to increase, and the exigencies of a modern architect's practice call for a dozen experts merged into one. He never knows what the scope of that practice may demand: anything between the designing of an altar cloth or chalice veil to the settling of some intricate legal difficulty or the cure of a smoky chimney. He must be a sanitary specialist, a ventilation specialist and a constructional specialist; capable of supervising or arranging the installation of electric power or light, acetylene gas, heating apparatus or laundry machinery, lifts or cooking plant.

He must be *au courant* with the latest fad; must advise on all forms of decoration; be an artist in colour schemes; understand the stoking of a kitchen range, or laying-out a garden. He must have an all-embracing knowledge of the nature and properties of materials; and, if we are to judge by the advertisements for assistants in the professional journals, must be a quantity surveyor as well. Small wonder if, in his anxiety to find scope for a little design, and comply with the innumerable by-laws, Building Acts, and vexatious regulations, he occasionally puts drawing-room handles on a classroom door, passes Swedish timber as Russian, or omits to specify a stick for the scullery copper. I am not quite sure that we are alive to the full demands of the age, or that we are taking steps to keep ourselves fully abreast of it, or that not only ourselves, but those who will take up our pencils in the time to come, are efficiently equipped for the modern architect's career. I do not think as yet we fully recognize the changed conditions under which we practise, and unless we do some foundation will continue to exist for the charges levelled against us.

Are we ahead, not abreast, of the demand for technical education in these days? Are we conversant with the recent scientific discoveries? Are we making proper use of new inventions and applications of materials? Are we taking the measures we should to minimize fire risks? I do not know that we are.

Hedged about as we are with difficulties, hampered at every turn, we can neither experiment on our clients nor at their expense. Our opportunities of testing materials are limited, and we fear to attempt new departures lest they prove failures and bring down upon us the wrath of our clients. No wonder we are dubbed old-fashioned and accused of lagging behind the age.

Perhaps, too, in time our employers will come to realize that the scale of remuneration is not always such that it should command the services of many experts in the person of one man, who, if he is to earn a decent livelihood, must so overburden himself that he cannot give the attention he would wish to minute details.

It is coming to this, that with the multifarious requirements now demanded of the architect life will be too short to cram into it the requisite amount of study, and we shall have to specialize more and more. It may be that our system of training is too general and too superficial, and the problem will be to develop the particular bent, to encourage the special talent of the young beginner. I am not sure, myself, that our present system of training is by any means perfect. I think far too much time is spent over "the orders," to the detriment of more important subjects.

A discussion followed in which Lord Windsor, Messrs. Francis Hooper, John Murray, W. A. Pite, W. W. Gwyther, R. H. Weymouth, Munby and Henry T. Hare took part.

The report of the scrutineers as to the annual election of officers was then read. The list is as follows:—President, Mr. Henry T. Hare; vice-presidents, Messrs. R. S. Balfour and Arnold Mitchell; committee, Messrs. W. A. Pite, Louis Ambler, A. N. Prentice, E. Guy Dawber, W. Howard Seth-Smith, E. L. Lutyens, John Murray, J. S. Gibson, F. D. Clapham and R. H. Weymouth; hon. treasurer, Mr. Francis Hooper; hon. librarian, Mr. J. MacLaren Ross; hon secretaries, Messrs. H. P. G. Maule and Henry Tanner, junior.

THE EFFECT OF DESIGN ON CONSTRUCTION.*

From a Contractor's Point of View.

By R. W. NEWMAN, A.M.I.C.E.

WHEN speaking of design we are apt to think of drawings only, whereas the specification, the quantities, and more especially the instructions of the engineer as the work proceeds, govern to a very great extent the methods which the contractor has to adopt in carrying out the work in the most economical manner. While the drawings show the work as it will appear when completed, and the specification gives in somewhat general terms the methods which will have to be adopted in constructing the works, these may as the work proceeds be modified almost out of recognition by variations made and covered by clauses in the specification which give the engineer power to vary, increase or decrease while adhering to the prices tendered. From this cause arise difficulties, delays, &c., ending often in claims which create friction and annoyance, for which the contractor cannot justly be held responsible.

It is frequently a matter for comment that the prices tendered for work vary so much—there being often a difference of as much as 50 per cent., but it must be borne in mind that the same difference may exist in the estimated cost of the designs of different engineers when they are designing schemes whose ultimate object is the same.

I propose to show how, by various small differences in design, the cost of construction may vary over a very wide range.

Nothing is more misleading to those who have not had experience of pricing work than to refer to one of the excellent handbooks on contractor's prices, and to see there the price of—say concrete—given at a figure which takes no account of the quantity to be dealt with, the locality, the nature of the materials of which it has to be made, the proximity or otherwise of the necessary materials, and also, in the case of large works, of the supply of suitable labour.

I believe that the popular impression is that a contractor, having obtained a contract, designs the plant necessary to execute the works in the most economical manner. However correct this impression may be in the case of works extending over many years, it is decidedly not so in the majority of contracts, for unless it is certain that the special plant will effect sufficient saving to ensure its initial cost being refunded with interest during the particular contract for which it is made, it is better to use types which can be adapted to various classes of work, as in this way only can the cost of the plant be spread over more than one contract; otherwise the contractor may find on the completion of a particular contract that he has on his hands machinery for which he has paid a large sum and for which he has no further use.

Herein lies the advantage to a contractor in having an accurate bill of quantities, *i.e.*, one in which the quantities are entered as the actual quantities which the work will take if carried out to the drawings, and if the drawings are based on the fullest possible information which could be obtained before tenders were invited. As the reverse of such a bill, we may have one which has been drawn up so that the quantities, when priced out, may cover any possible contingencies which may arise, so that in any event the total amount of the tender may cover the final cost of the work when the contract has been completed.

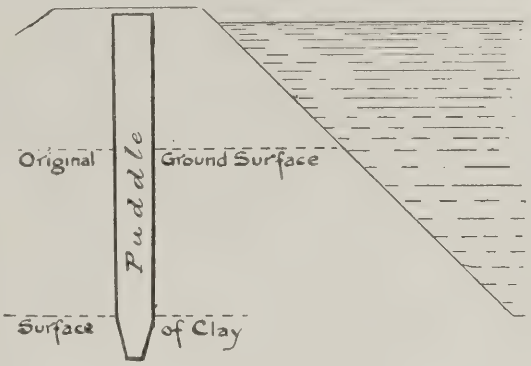

FIG. 1.

To illustrate a disadvantage a contractor may suffer from, suppose that a contract includes some heavy foundations estimated at, say, 10,000 cub. yds. of excavation and concrete. This quantity will justify the contractor in getting sufficient plant on the ground to deal with it in the time specified; but suppose that after the work has been some time in progress the engineer decides that he can get a good foundation with half the depth of excavation and consequently, say, half the concrete. Had the contractor known that the bill of quantities had been drawn to cover any contingency which might arise, such that the foundation might be good enough at the shallower depth, he would have hesitated before obtaining so much plant and sought more definite information to act upon.

The reverse conditions apply, still to the detriment of the contractor, when, say, some foundations have to be filled with concrete, the amount given in the quantities being, say, 5,000 cub. yds. and proving to be 10,000. If the price of materials has gone up in the interval between the contract being let and the increase in the quantities, the contractor may have to pay away the profit to which he is entitled in buying the additional materials at a higher price, without being able to obtain an equivalent increase in the price per cub. yd. in his original tender.

I have dwelt on this point at some length, because it shows how desirable and fair to the contractor it is that the engineer should have at his disposal the very fullest information before the quantities are drawn up, and that his quantity bill should be based on these data.

As a simple illustration of the effect of design on the methods of construction, we may imagine the construction of a large reservoir the excavation from which is composed of the following, in order from the ground surface:—Turf, 6in.; soil and loamy material, 1ft. 6in.; gravel, 8ft. 6in.; clay, 10ft.

Supposing the excavation is to be used to form the banks (Fig. 1), and that while sufficient clay and gravel have to be obtained to make the puddle wall and concrete the engineer has specified that the various strata above mentioned may be mixed to form these banks. The probability is that the contractor would put in a steam navvy, get to the level of the bottom of the reservoir without delay, and excavate as much as possible in one face. But, on the other hand, suppose that the engineer specifies that the turf must be tipped to spoil, and the soil and loamy material must be used only for soiling the banks of the reservoir when finished; that the gravel must be the only material used in forming the banks; and that all clay beyond that required for the puddle wall must be tipped on the site selected for further contemplated work. The contractor might then consider it would be cheaper to excavate the various strata by hand labour. It will at once be appreciated that even the simple operation of moving earth, as also the question of cost, will be influenced by the design of the works as covered by the specification, though the difference may not be apparent by looking at the drawings.

One of the largest unknown quantities in all contracts must of necessity be that of "dealing with water" found in the excavations, and it is one of those questions which is left to the contractor to estimate for and deal with, subject to the usual restrictions that the methods adopted must be to the satisfaction of the engineer. This is always a difficult matter, and one which does not admit of the same general treatment; each case must be considered on its merits, bearing in mind the local conditions, namely, strata passed through, liability of site to floods, the depth from which the water has to be drawn, the proximity of the nearest watercourse to which the water can be discharged, &c. Speaking generally, it will be found to a contractor's advantage to provide a reasonable excess of pumping power to meet sudden emergencies; to sink sumps clear of the work to be drained, not in part of the excavation in which the permanent work has to be placed, and also to make as free use as possible of sub-pipes. A judicious initial outlay on a system of temporary drainage is often as much in the interests of good sound work as it is an important factor in the economy of construction.

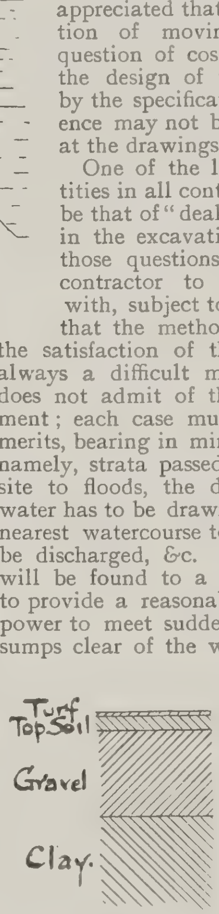

FIG. 2.—TYPICAL SECTION OF GROUND.

Figs. 3, 4 and 5 illustrate a typical section of a wall of, say, a gasholder tank, which would probably be rendered on its internal face so as to retain water within the tank. Fig. 3 shows puddled clay put behind the wall, which will in a great degree give the desired result, and no difficulty should be experienced in applying the rendering. In Fig. 4 is shown a sump sunk independently of the main excavation, and a series of agricultural pipes laid round the tank to carry off the subsoil water as readily as possible to the sump, from which it is removed by a temporary pumping plant. Imagine for a moment that the pump is not in use; the water rises in the subsoil and finds its way through the brick or concrete wall—not in large quantities, but sufficiently to keep the face of the wall damp. Try as you will, the cement rendering will not adhere; but keep the water down and the rendering will adhere without difficulty, and having once set the pump may be stopped and the gasholder tank will be watertight. As an additional precaution it may be well

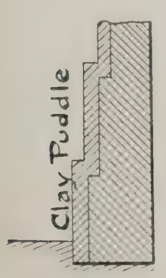

FIG. 3.
Wall backed with puddle.

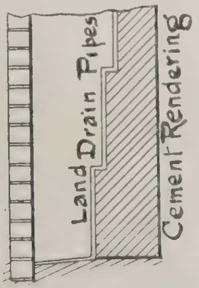

FIG. 4.
Wall with sump sunk independently.

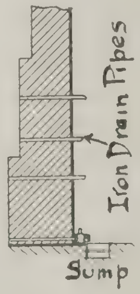

FIG. 5.
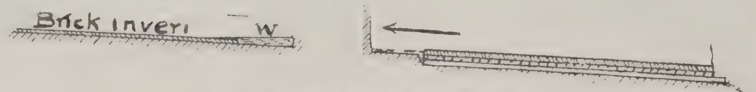
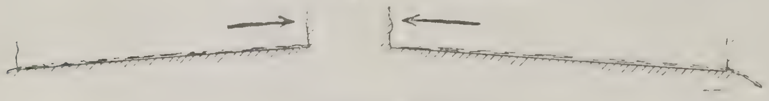
Sump formed inside permanent work.

---

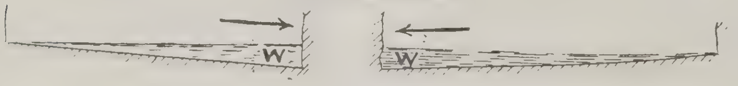
* A paper read before the Junior Institution of Engineers on April 24th, 1903.



(a) One Falling and One Rising Face.



(b) Both Faces Rising.



(c) Both Faces Falling.

FIG. 8.—SHOWING THE ADVANTAGE OF DRIVING A TUNNEL ON A RISING GRADIENT.

to fill the tank at the same time to balance the pressure within and without, and thus not put any undue strain on the rendering until the work has had some time to set properly. Fig. 5 shows a less expensive method of dealing with the water, by putting a series of iron pipes through the wall at various points to let the water at the back of the wall have a free vent. The water is then pumped up from a sump inside the tank, and after the rendering is completed the cocks on the pipes may be closed, or the pipes may be so constructed that they can be unscrewed and plugs inserted, the rendering being afterwards made good at those places.

In passing through a water-bearing into an impervious strata, it is often advisable at the top of an impervious strata to form what is known as a garland, as shown in Figs. 6 and 7. The water in the water-bearing strata falls into this, and is led off into the sump, thus reducing the depth from which the water has to be pumped; the water to be pumped from the bottom of an excavation being only that due to dropping from the garland or other minor cause. The great advantage of a garland is that all excavation in the impervious strata is carried on in the dry at consequently less cost and with greater comfort to the men.

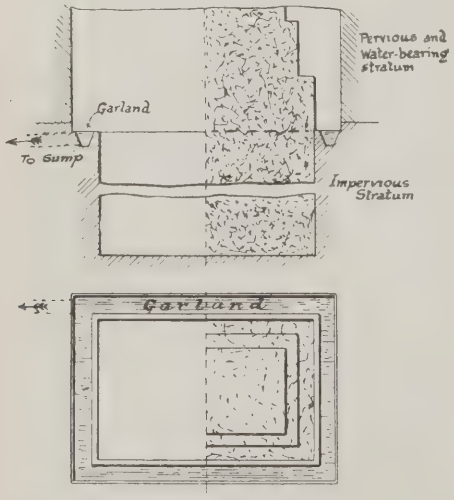


FIG. 6.—HALF-PLAN. FIG. 7.—HALF-PLAN OF CONCRETE.

Sub-pipes, which are only pipes laid for the purpose of temporary drainage below the level of the work under construction and which are left in place permanently, are not only a great advantage to a contractor but go far to ensure better work, because it can be built under drier conditions. These pipes are usually omitted from the design, and I have frequently been surprised to note how often engineers hesitate to sanction their use. Fig. 8 shows diagramatically the driving and lining of a tunnel in which a sub-pipe is used, and the effect when such a simple precaution is not adopted, necessitating, in addition to the cost of pumping, the whole of the water being pumped over the finished invert, which, despite all precautions, must suffer in consequence: (b) and (c) show respectively the advantage of driving a tunnel in an uphill direction and the disadvantage of driving it on a falling gradient, when the water **W** backs up in the face and necessitates continual moving forward of the pumps, which, in the case of a rock tunnel, have to be altogether removed or protected whenever blasting takes place. Though it is not always possible to design a tunnel so that the highest point is midway in its length, the effect of the design in cases where such an arrangement is possible is a material factor in the method and especially the cost of construction.

Retaining walls, in which class may be included those which support earthworks, either by themselves or in conjunction with an arch, in which case they form side walls to culverts, tunnels, &c., do not at first sight appear to give much opportunity for variation in design or much latitude in their method of construction. These walls, for the purposes of comparison, may be classed into:—(a) vertical, (b) battered, (c) curved, the last form giving the most economical distribution of material for the required purpose. Such walls are generally built wholly of concrete or brickwork, in which case there is little difference in the methods adopted in their construction, except that in concrete walls with curved face the shuttering must be curved.

With brick-faced walls having a concrete backing the conditions are different. Taking first the case of a vertical wall with a 4½in. brick-facing, having heading courses built at intervals, the brick-facing must be carried up to the underside of the first heading course, and after sufficient time has elapsed to allow the work to set properly the concrete is put in behind this, and the brick-facing is again built to the level of the underside of the next heading course, the concrete being again put in behind this, and the cycle of operations repeated until the wall is complete. In Fig. 9 is shown a method of building a concrete wall with 4½in. brick-facing which has none of the previously mentioned disadvantages of limiting the height to which the concrete can be put in to the height of the heading courses shown on the drawing. In this example steel ties **T**, at levels corresponding with a given number of courses of brickwork, are built into the horizontal joints as the work proceeds. The only additional cost thus entailed to a contractor is that he must make the height of the concrete shutters correspond with a defined number of courses of brickwork. It will be noticed that this method does not limit the contractor to any definite height in his lifts of concrete; he can make them to correspond with the levels of the temporal strutting, a very important consideration where the ground is treacherous or heavy.

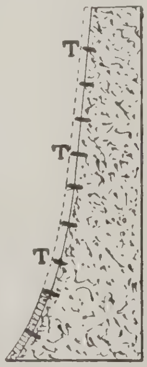

FIG. 9.

(To be concluded.)

CONCRETE AND HOLLOW TILE CONSTRUCTION.

IN the course of a paper read before the recent Convention by the Ontario Association of Architects Mr. Shankland said:—Concrete-floor systems are now being exploited in great variety. Some of the systems have merit, but all of them make too great claims. A concrete slab 3in. or 4in. thick, even if reinforced with steel in some form or other, should not be used in a very much greater span than we now use for steel beams with hollow tile arches between. It has been gravely told me by a concrete sales agent that in case of two 15in. beams, say 7ft. span, it would be perfectly safe not only to deduct the difference in weight of floor between the 3in. concrete slab proposed to be used and the weight of a 15in. hollow-tile arch, but in addition the section could be reduced 25 per cent. on account of the help the concrete gave to the steel. In other cases they state you can, with concrete, use 17ft. to 25ft. spans, and save all the steel thereby taken out. One question, however, they decline to answer. Ask them, instead of telling the vertical load it will support without collapsing, to turn their slab of concrete 3in. or 4in. thick and of 17ft. to 25ft. span, on edge, and then load it. They invariably decline to test it this way. Now, in a twenty- or thirty-storey office building lateral stiffness in the floors is more essential than carrying capacity. A thin slab of concrete laid on top of twelve or fifteen beams cannot by the very nature of things add to the lateral support of these beams. But a 12in. or 15in. hollow-tile arch laid in between the beams does make a stiff floor. Experiments as yet have not demonstrated that concrete floors are fireproof, as compared with hollow tile, which already has been burned. While I have faith in concrete and believe it has great possibilities which will be demonstrated in the future, yet I think that now, in order to compete with hollow tile, its advocates are making claims which cannot be substantiated, and in the future they will have to be more conservative not only in their statements but in their construction in order to succeed. Recent failures in Jackson, Mich., where the falling of the floors pulled down the outside walls, and of four floors which collapsed in an apartment building in Chicago, will undoubtedly prove beneficial in the lessons they teach. Many other failures in concrete-floor construction have occurred in the past few years.

Another Aspect of the Question

Mr. Leopold Mensch, in a paper which he read before the Civil Engineers' Club of Cleveland, said:—

"The universal reign of steel is irrevocably past, and we are returning with rapid strides to the old time-honoured masonry construction. Not to brick- or stonework, but to an artificial stone, *i.e.*, concrete, strengthened by steel. This composite material is variously called concrete-steel, ferro-concrete or armoured concrete. Concrete itself is not a new building material. Vitruvius Pollo, the famous writer on architecture and engineering, who lived in the beginning of our era, describes it as one of the most valuable building materials, and as one which, centuries before his time, had been used for foundations for walls and in all structures where great strength was required. The great dome of the Pantheon in Rome, 142ft. in diameter, was built entirely of concrete, and it stands to-day, having braved the destructive influences of nature for nearly 2,000 years. In the House of the Vestals an upper floor of 20ft. span was a simple slab of concrete 14in. thick. Even in Mexico there are buildings, the remains of an unknown civilisation, which have concrete foundations, and in the Italian colonies of Magna Graecia there is evidence that the ancient Greeks knew what concrete was and how to apply it. The walls of Reading Abbey, in England, were apparently faced with square blocks of stone on both sides, and the core and backing were made of concrete, with the result that although the stone appears to have perished the concrete, which was intended to play a secondary part, still remains."

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Cements.

IRON BRIDGE.—CRICKET writes: "Kindly name a book on cements, explaining their nature, &c. I am anxious to understand what kinds are most suitable for fixing tiles and briquettes to walls, fireplaces and ceilings."

"Lime and Cement," by A. H. Heath (B T. Batsford, 5s.), will serve your purpose. See also "Specification, No. 6."

Sea-Sand Mortar.

ROTHERHAM.—ENQUIRER writes: "I propose to build a brick house on the east coast of Yorkshire. Would you advise the use of sand from the sea-shore for making mortar? Also, could the pebbles be used for concrete to foundation footings?"

Sea-sand makes very good mortar, only it should be washed in fresh water before use, if it is desired not to have the salt effloresce. Sea-worn pebbles do not give that hold or binding power that angular stones do in concrete, but they would be quite satisfactory if used in proportions of about 4 and not more than 5 to 1 of cement, if the latter is good.

Architects Advertising Themselves.

CARDIFF.—SET-SQUARE writes: "I am about to start an architectural practice in a town near here. Would it be advisable to advertize myself in a local daily paper; if so, what form should the advertisement take?"

No self-respecting architect should advertize himself—it is beneath the dignity of the profession, and helps to bring it into disrepute. An architect's first commissions are usually secured through the agency of friends or relations. Success in competitions often leads also to the creation of a practice. But if you are content to go on slowly for a few years, studying your clients' interests to the utmost, and are competent, never fear that you will achieve a position.

Buildings to Measure around Bradford.

BRADFORD.—TWO-FOOT writes: "Kindly name a few buildings within ten miles of Bradford suitable to measure for the R.I.B.A. testimonies of study."

The building most suitable for your purpose, and within the distance of 10 miles, is Kirkstall Abbey, which is of a style transitional between Norman and Gothic. There is a good Early English church at Ilkley. You will, perhaps, find some good work in the parish churches of Bradford and Halifax and in St. Michael's, Dewsbury. You limit yourself to a distance of 10 miles, but it would certainly be worth your while to visit the abbeys of Bolton and Skipton and also the church of the Holy Trinity, Skipton. Bolton Abbey possesses features in all three of the English Gothic styles as well as some Norman work, among which there are some excellent thirteenth-century windows with a Flamboyant tendency. M.

Sale of Practice.

PRACTICE writes: "What are the usual terms for the purchase of an architect or engineer's practice, and for a share in an established practice?"

See answers to enquiries on this subject on p. 12 of our issue for February 19th and p. 232 of our issue for May 28th, 1902.

"Specification": Church Design.

OAKAMOOR.—F. H. writes: "Which numbers of 'Specification' are now in print? Kindly name a book on church architecture giving construction and details."

We can still supply a few copies of all the numbers of "Specification." The price of Nos. 1, 2, 3, 5 and 6 is 5s. nett, and of No. 4 10s. nett. There have been a number of books published on the design of churches, but as they appear to be all out of print you will have to consult them at a library or secure second-hand copies. You can find the titles from the library catalogues. We advise you to consult the works in the R.I.B.A. library, 9, Conduit Street, W., the British Museum or the Birmingham Central Library. There is a very good article on the design of churches and their fittings in "Specification, No. 6," which you should read.

Winchelsea Church.

LONDON, E.—S. J. writes: "Kindly give some particulars of the history of the church of Winchelsea, Sussex."

Winchelsea Church was dedicated to St. Thomas of Canterbury (*i.e.*, Thomas à Beckett) It is Decorated in style, dating from *circa* 1300. All that now remains of it is the chancel, with its two chancel aisles, and fragments of transept. The nave appears never to have been built. In the north aisle are three canopied tombs—a knight in mail, a lady in the dress of Edward III.'s time, and a priest in a robe. In the south aisle there are also two fine canopied tombs. The west end of the latter aisle was altered to form a vestry, some of the tombs being damaged in the alteration. The earliest tomb is that of Gervase Alard, Admiral of the Cinque Ports in 1303 and 1306. The effigy has the legs crossed, the hands clasping a heart, and the feet resting on a lion. At the angles of the canopy are heads, generally considered to be those of Edward I. and Queen Eleanor. The other tomb is thought to be that of Gervase Alard's grandson, Stephen Alard, Admiral of the Cinque Ports in 1324. This aisle was originally the Alard chantry; the sedilia and piscinæ still remain. The church was built at the same time as the town, which is known as New Winchelsea, the old town being almost entirely destroyed by the encroachment of the sea in 1287.

G. A. T. M.

Advertising Board on House.

NIMANEB writes: "My client is the owner of a house which has on one side another building rising a storey higher than my client's. The owner of the higher house has fixed an advertisement board on his gable wall above my client's roof. It is supported by iron hooks, and projects about 6in. from the gable wall. In default of obtaining a letter from the adjoining owner undertaking to pay a peppercorn rental for the board and to remove it when required, my client can, of course, block it by placing another board in front (supported independently) to prevent right accruing; but should he wish to raise his house, the board would actually be in the way of the new walls. Could he then remove it, or cut off so much of it as projects over his building? The adjoining owner seems to have a right to project about 4½in., there being an offset to his wall of that extent?"

It would be best to consult a solicitor and allow him to negotiate. He would probably advise that notice be given that if the board be not removed by a certain date, so much of it as overhangs your client's premises will then be hacked away. Your client would, I believe, be perfectly within his rights in roughly hacking off all that overhangs, including the iron support. When this has been done your client should then erect a board of his own in the way suggested by you, to prevent his neighbour acquiring a prescriptive right to display his advertisement. Probably long before matters have gone so far as this the neighbour will have signed an agreement to rent the right of overhanging and displaying at a small rental, the tenancy to terminate at short notice on either side.

G. A. T. M.

Ordnance Survey.

HESSLE.—J. J. writes, "Is the Ordnance Survey done by the Royal Engineers? How are the situations obtained? Could I, with knowledge of the theodolite, levelling and chain surveying, obtain such a position?"

The Ordnance Survey, though under the control of Royal Engineer officers, is separately organised. Application for employment should be made to the Commanding Officer, Royal Engineers, Ordnance Survey Department, Southampton. M.

Building to Boundary of Property.

NEWCHURCH.—WHITEWELL writes: "The boundary between two plots of land is the centre of a hedge belonging to A. B, the other owner, wishes to build as near to his boundary as possible. A insists that B shall not injure his hedge. What is B's position? The hedge is quickthorn and has been in existence thirty years."

The question is, I think, a little inaccurately stated, because if the hedge belongs to A, it should presumably *all* be upon his land, and how then can the centre of the hedge form the division line of the two properties? How does A trim the outer side of his boundary hedge if he possesses no ditch or land upon which he can stand while he trims—presumably only by B's consent? If the fence overhangs B's land it forms an encroachment, and he may cut off the overhanging portion, though I do not advise so high-handed a proceeding save as a last resort. As the hedge has only been planted thirty years, no doubt the position of the exact boundary line can be determined, and I should advise B (having first made sure of all the facts) to approach A with the suggestion that the hedge should be removed, at B's expense, so far as the wall of the new building will render its existence unnecessary; B then building right up to the boundary line, but of course taking care not so to put in the footings or to overhang the rafters as to form any encroachment on A. If A will not consent to some such arrangement (and presuming it is certain the hedge—and no more—is A's) I advise B to build as near to the quick as he is able to do without injuring it. Probably the hedge will partially die from want of light, but this is no concern of B's. It is better for B to suffer the deprivation of a narrow strip of land than to risk any appeal to an action at law, which would probably cost him more than the value of the land, whether he won or lost. G. S. M.

Wind-Pressure.

PLYMOUTH.—VENTUS writes: "In Major Druitt's report to the Board of Trade concerning the overturning of passenger-train carriages on the Severn Viaduct during a gale on February 27th last it is stated: 'It has been shown by careful measurements at Bidston Observatory that a run of wind of even 70 miles an hour might exert a pressure of 48lbs. per sq. ft.; the average pressure at 80 miles an hour is 60lbs. per sq. ft., and that at 90 miles an hour 71lbs. per sq. ft.' Does this refer to the same pressure indicated in the well known formula p (lbs. per sq. ft.) $= {\cdot}005V^2$ (miles per hour)?"

The whole question of wind-pressure is in a very unsatisfactory condition; very little is really known about it, and there are no ready means of learning more owing to the inherent difficulties of the case. Theoretically the effect of the wind as a moving fluid impinging upon a normal surface will be to give a pressure of $p = 0{\cdot}003\,V^2$, where p = lbs. per sq. ft. and V = miles per hour. Owing, however, to the striking particles having to be deflected, and owing also to suction at the back due to the deflected currents, the pressure may reach a maximum of $p = 0{\cdot}006\,V^2$. The usual limit is considered to be $p = 0{\cdot}005\,V^2$ for a wind blowing with uniform velocity. By careful observation it has been found that an hour's run of an anemometer, while it registers the whole run of the wind in that time, will not give a true average, owing to the wind coming in gusts and spurts. It was considered by the Wind-Pressure Commission that the maximum pressure might be taken as double the mean hourly pressure, making the formula for practical use $p = 0{\cdot}01\,V^2$. Applying this to the figures given, (*a*) 70 miles per hour, $p = 0{\cdot}01 \times 70^2 = 49$lbs. per sq. ft.; (*b*) 80 miles per hour, $0{\cdot}01 \times 80^2 = 64$lbs. per sq. ft.; (*c*) 90 miles per hour, $p = 0{\cdot}01 \times 90^2 = 81$lbs. per sq. ft., so that Major Druitt's figures are based upon some intermediate coefficient, or, more probably, upon a slightly lower power than the square of the velocity. HENRY ADAMS.

Porous Brickwork.

MOFFAT.—J. T. J. writes: "What is the value of water-glass as a preventative and remedy for rain driving through porous brick walls and rendering the room damp?"

I very much question the efficacy of water-glass for the purpose mentioned, as any preparation for coating the exterior of an exposed wall must be quite insoluble in water and proof against the dampness or acidity of the atmosphere; and in this respect I have some doubt as to whether water-glass would be of permanent durability. A solution of $2\frac{1}{2}$lbs. of soft soap, 1 gal. of linseed oil, and 1lb. of rock alum has been recommended, but this requires very careful mixing, preparation by long boiling, and discretion in its application. I do not advise its employment unless by someone who has had experience in its use. I have used the Silicate Paint Co.'s (address Charlton, S.E.) preparation with good effect on many occasions, and hear very good accounts of the Indestructible Paint Co.'s (27, Cannon Street, E.C.) colourless paint. In using these solutions it is necessary to apply several coats, in order that every pore in the brick or stonework may be thoroughly filled. Keep on applying it coat after coat, until it all runs down the face of the wall and can be made to adhere.

G. S. M.

Colouring Copper Green.

LONDON, S.W.—G. A. P. writes: "I wish to treat a copper-covered flèche with some solution which will make it weather green. Can you recommend one?"

There is a dearth of information on the subject, and we have been obliged to make several experiments, with the result that we suggest the following as worthy of adoption. It should be stated in the first place that the green coating of weathered copper is basic carbonate of copper. We have proceeded therefore to endeavour to produce this artificially, with ease and quickness. Make a solution of copper sulphate (blue copperas) in water and brush it on the copper. Allow to dry, and then spray on a solution of ordinary washing soda (sodium carbonate). The latter decomposes the sulphate with the production of green carbonate of copper, which is left as a film on the surface. This is sure to wash off to some extent with showers of rain, but the action, once started, will continue. We advise the spraying-on of the soda solution rather than the use of the brush, as the latter would make it rather smeary. The method may not be new, but we have not seen it suggested before.

R.I.B.A. ANNUAL REPORT.

THE annual report for 1902–03 of the Council of the Royal Institute of British Architects gives the present membership as 1,787, a nett increase of 55 during the year. The Council, with the approval of the L.C.C., has decided to hold the statutory examinations for district and building surveyors only once a year in future—in October. The question of new premises is still postponed till a favourable site is available, but some improvements have been made in the council-room at 9, Conduit Street—the recess behind the chair has been altered according to the design of Mr. J. S. Gibson, and the new system of electric lighting carried out under the direction of Mr. John Slater and Mr. E. T. Hall. The Council has decided to issue an album of photogravures of past-presidents, with spaces for future plates. With regard to the possible effect of the case of *Hobbs* v. *Turner* on the validity of the Institute form of contract, the Council has been advised that there is no need for any alteration. The Ancient Lights Bill, approved by the Council of the Institute and the Council of the Surveyors' Institution, is now in the hands of Mr. J. Fletcher Moulton, K.C., M.P., who will introduce it into Parliament. After some correspondence the Council was informed that the architect and engineer to the L.C.C. would collaborate in the design for the new bridge at Vauxhall. The Council has much pleasure in recording the alliance of the Edinburgh Architectural Association with the Institute. The operation of part of the proviso of by-law 9 lapses on the 18th inst., namely, "Provided always that when the Council of the Institute receive a unanimous recommendation formally submitted by the council of any allied society that a practising member of the profession is eligible and worthy of being elected as a Fellow, the Council shall, during the five years from the date of approval of this provision by the Privy Council, have power to elect him, if in their opinion his work be of sufficient merit." The second clause: "The Council shall also have the power to elect annually to the Fellowship without ballot the president or the president-elect of any of the allied societies who may be eligible and apply for admission," is not subject to the five years' limit.

The Council has been brought to the conclusion that the appointment of assessors in competitions is best left in the hands of the president, and that, even were it desirable, there is little chance of establishing the jury system in this country. A practical result of the deliberations of the select committee of the Council was (1) a revised edition of the "Suggestions for the Conduct of Architectural Competitions" and (2) a confidential set of suggestions for the guidance of assessors. A copy of the former, with a circular letter, was sent during the summer to every town council, urban district council and rural district council in the United Kingdom. The Council expresses itself quite in sympathy with the Competition Reform Society, which reports to the secretary of the Institute any competition matter that may need investigation. The matter being thus placed in the secretary's hands becomes an entirely Institute question, and in furnishing such material for Institute action—material which it would be often impossible to obtain officially—the Competition Reform Society is doing exceedingly useful work. The accounts show a balance of £1,028 15s. on the right side. The Practice Standing Committee published its book on dilapidations during the year. It has under consideration a form of architect's certificate (which it is suggested should be issued in book form) and a form of sub-contract. The Science Standing Committee reports that its proposals for the standard size of bricks have been provisionally agreed to by the representatives of the brickmakers' associations, and only now await ratification by these associations. The Committee hopes that architects and engineers will insert the standard in their specifications and so check the serious differences in the size of bricks that interfere with good sectional bonding.

THE HEATING OF TRURO CATHEDRAL.

THE system adopted for heating the new cathedral at Truro is a combination of warm air and low-pressure hot water. It has been carried out by Mr. John Grundy, of London. The heating chamber, which is situated under the north transept, has been equipped with Mr. Grundy's latest improved type of combined heating apparatus, the furnaces being so arranged as to give the maximum amount of stoking space and fuel storage available. The warm-air ducts and gratings which existed in the older portion of the cathedral have been allowed to remain. The longest of these, which extended to St. Mary's Chapel, being a brick duct 2ft. 6in. wide by 2ft. deep, has now been made to form a double purpose, first as a warm-air duct, and secondly as a trench containing hot-water pipes. St. Mary's Chapel, which is at a different level to and somewhat cut off from the main body of the cathedral, has always been the cold corner, so to speak, and special attention had to be paid to this fact in designing the new scheme. This difficulty has been entirely overcome by the addition of hot-water pipes, fixed along the south wall of the chapel, the mains of which are carried in the existing warm-air duct just mentioned. The introduction of the hot-water pipes has greatly added to the comfort of the worshippers at the daily services. A new warm-air duct has been constructed from the heating chamber under the centre of the nave, and terminating near the west entrance. Branch warm-air flues are taken from this main duct, which is 2ft. 6in. square, the warm-air outlet gratings being placed at intervals between the columns. Where the main duct terminates, and leading into it, a large brick chamber has been formed, 20ft. long by 8ft. wide, containing a battery of gilled hot-water pipes, the total of which represents 450ft. super. of heating surface. Over this chamber warm-air outlet gratings are fixed, fresh air being admitted to the battery by means of two cold-air gratings, which are placed on either side of the porch. By this means the heating of the extreme west end of the cathedral is ensured, the battery being about 150ft. from the heating apparatus. The main duct has again been made to serve the purpose of providing a means of running the hot-water mains, these mains in their turn assisting to warm the air in the duct, thus always ensuring a good current of warm air. Additional fresh cold air has been taken from various sources to the apparatus, and a special automatic humidifying apparatus has been fixed, which agreeably moistens the warm air. The whole of the crypt and vestries throughout are heated by means of hot-water pipes and radiators. Undoubtedly a striking feature of the heating to the casual observer is that the cathedral is found to be thoroughly and equably warmed with scarcely any apparent means to accomplish this object. In no instance does any part of the heating apparatus show above the floor, except the pipes in St. Mary's Chapel.

BUILDING CONSTRUCTION.—IX.

By Our Special Contributor.

(Concluded from p. 14 of No. 419).

In former articles I dealt with the stresses of structures under applied forces, and gave examples of the graphic determination of the stresses in braced girders and trusses. I endeavoured to give a rational treatment, as far as I have gone; that is, I tried to carry the intelligence of the student with me so that at no time was he merely copying a diagram. In this view the stress diagrams of trusses have had reference to trusses not necessarily under vertical loads: the loading was such as might be expected in actual experience, and I hope I have made the mode of finding the stresses fairly clear. If I have succeeded, we have saved the time which would otherwise be spent in first practising with vertical loads, and we may have avoided setting up a habit of blind routine. It is quite common to meet the expression, "theoretically" so-and-so is the case, but "practically" such-and-such must be done. It would perhaps be well if this language could be avoided, but it is the result of experience which deserves notice. In practice we deal with questions of very great complexity, and have to prepare ourselves for these complex questions by considering questions invented to enable us indirectly to more or less clearly see our way to the approximate solutions of practical questions. Suppose we join two iron straps by lapping them and riveting them together with, say, three rivets in a line (chain-riveting). And now suppose we stress the joint. It is generally assumed that each rivet does equal duty, but as a matter of fact any one of the three rivets may be bearing the whole of the applied stress: if the stress is more than one rivet will bear, the rivet yields until another rivet comes into bearing, and if the load is increased the first rivet is further strained and the second rivet is also strained before the third rivet is in bearing (rivets 1, 2 and 3 may be in any order). If the workmanship is good, what is called the "theoretical" condition is approximated to, but if the workmanship is bad rivets Nos. 1 and 2 may with a great stress) be strained beyond elastic limits and the joint will have little more strength than a single rivet would give it. If the student will take a fairly rigid chair and set it on the floor he will find, on trial, that it rests on three legs only; it will rock easily on two legs and so bear on these and either one of the other two. It may be loaded so that by the yielding of the material the chair bears on all four legs, but the student cannot tell accurately the stress in each leg. The trusses we have dealt with are studiously "determinate." It is advisable that we take an "indeterminate" example. In the case of a bridge girder, when the girder is of very great span its weight is great in proportion to the weight of a moving load (say, a railway engine). It may be designed of a simple determinate form, and it may be found that a moving load will not reverse the direction of stress in any position of the load upon the girder. But the case will be different with short spans, and it is often found convenient to use an "indeterminate" form of bracing. There is not much good in the student having shown to him ways of drawing the stresses of fanciful forms of bracing: it will be well for him, if he has fairly comprehended the principles to be made use of, to assume probable loads for such braced structures as he may see in actual work and draw the stresses without coaching. I give two examples. In Fig. 1 the girder shown is loaded with weights 10, 30, 60 and 5. Because the structure is assumed to be "jointed" the stresses on such members as $c\ e$ and $g\ f$ must be equal (so long as the lines which cross are straight lines). This will be admitted as obvious when the bracing crosses at right angles. Suppose it does not cross at right angles (see diagram β). Let the force in A B be s acting at A: this may be resolved into two forces acting at A—$s \cos \theta$, resisted by a force in C A, and $s \sin \theta$ at right angles to C A. It will be seen that an equal and opposite force in D A acting at A may be resolved into two forces acting at A, equal and opposite to the first resolved forces, so that the effect of the line A C is nought. The girder may be taken as two girders which have common top and bottom cords. Consider the girder A B C D (top diagram of Fig. 1). Its reaction at A is $\frac{60}{3}=20$: that of the girder E F G H is $\frac{90}{3}=30$; the stress in $b\ c$ is therefore 30. We are now prepared to draw the stresses at the point A; as we know the directions of four forces at a point, and we know two of the forces, we can determine the other two forces; and it is found that the stress diagram for this girder gives no more difficulty than that of what are called determinate girders.

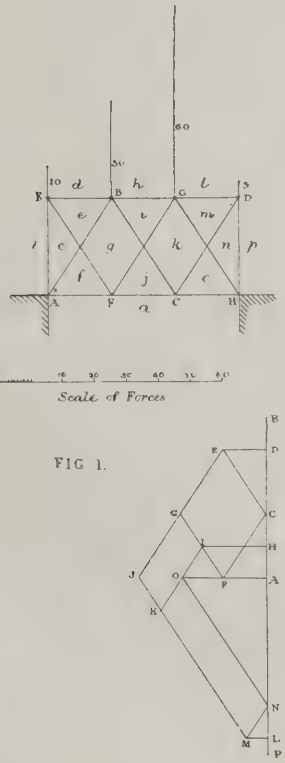

FIG 1.

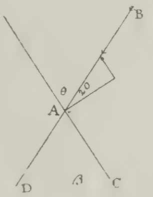

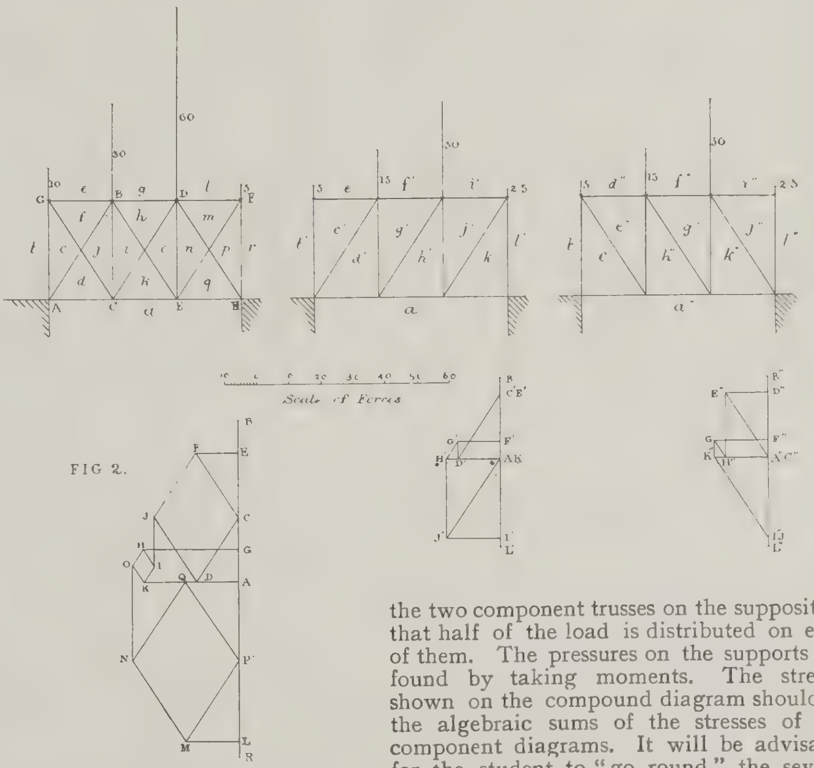

FIG 2.

The example shown by Fig. 2 goes a step further. The two girders here are, first, A B C D E F and, second, G C B E D H. In this example the members G A, B C, D E and F H are common to the two girders, and the cords are also common. (It would be bad for the student to explain the diagrams to him too fully. There is no more common mode of wasting time than by students sprawling over drawing-boards copying diagrams.) The drawing shows the compound stress diagram, and also the separate diagrams of the two component trusses on the supposition that half of the load is distributed on each of them. The pressures on the supports are found by taking moments. The stresses shown on the compound diagram should be the algebraic sums of the stresses of the component diagrams. It will be advisable for the student to "go round" the several joints, as has been already advised, marking the compressions and tensions on the members concerned. It is instructive to compare the compound diagram in Fig. 2 with the diagram in Fig. 1, and to note the effect of the two new members of Fig. 2 in modifying the stresses in the remaining members; it is seen that they reduce the maximum stress of the diagram. Results of this kind could not be foreseen, and the utility of diagram-drawing is made evident.

These particular examples are, it need hardly be pointed out, not practical examples. It will be useful for the student who wishes to become expert at the work to set himself practical problems, as, for example, showing the action of a moving load, like a railway train drawn by a heavy locomotive, placing the load in progressive positions on the girder. He should also in some reasonable way deal with the weight of the girder itself and the other "dead load" which it sustains. Stress drawing is useful and interesting work when intelligently done.

In these modern times of exaggerated individuality and universal polemics it is dangerous to commit oneself to an assertion of completeness or finality, and I shall not risk it; but, so far as questions of strength are concerned, I have endeavoured to cover as much ground as is absolutely necessary to those whose business it is to design buildings of any kind, and I think this ground has been covered. Like every subject under the sun, this subject (or these subjects) of strengths and dispositions of materials in structures may be developed infinitely, but the practical man cannot afford to spread himself infinitely in every direction. From time to time specialists have to be called in, when exceptional circumstances arise, but it is well to be able to determine when someone is needed with more special knowledge than we possess and to be able to intelligently consult with such a one over the problem in hand.

We have reached an interesting period in connection with the consideration of iron girders. It is about sixty years since this mode of construction may be said to have been much resorted to. In many cases old girders have had to be replaced with new girders, and there are lessons to be learned by observing in what ways the old structures were defective. The chief defect probably was that sufficient care was not exercised to provide for the easy regular removal of scaling rust and the prevention of rust at vital parts by constant attention and painting. I am particularly reminded of this because I see every day before me the renewal of iron bridges proceeding with such speed as a railway company can manage without too great interference with the regular traffic. The Niagara suspension bridge has disappeared, the recent damage to Telford's bridge at Bangor suggests thoughts, and I should be curious to know exactly how matters stand with the Britannia tubes. I think there is a noticeable general preference now for continuous plate webbed girders (having the webs stiffened by transverse T-irons riveted to them) over braced girders for moderate spans. There should be no foolish hiding of ironwork in such ways as that vital parts cannot be reached by the cleaner and painter.

Keystones.

Montrose Carnegie Library Competition.—The Montrose Town Council have accepted the plans of Mr. J. Lindsay Grant, of 2, St. Peter's Square, Manchester, for this building, which is estimated to cost £6,000.

The Memorial to the Royal Marines which has been erected in St. James's Park, near the Admiralty, was executed by Mr. Adrian Stokes, sculptor. Mr. T. Graham Jackson, R.A., supplied the design for the pedestal.

South Kensington Museum.—The basement of the new buildings of the Victoria and Albert Museum has been completed; and the contract for the next portion given to Messrs. Holliday & Greenwood, Ltd., of Brixton, who are now making the front picturesque with enormous derricks. As soon as these preliminaries are finished a very rapid rate of progress may be expected.

St. Louis Exposition.—Among the members of the British Royal Commission to look after the British interests in connection with the Exposition at St. Louis next year are:—Sir Edward J. Poynter, P.R.A.; Sir Lawrence Alma-Tadema, R.A.; Sir C. Purdon Clarke, Director of the Victoria and Albert Museum (Art Museum), South Kensington; Mr. Edwin A. Abbey, R.A.; Mr. Thomas Brock, R.A.; Mr. John C. Hawkshaw, president of the Institution of Mechanical Engineers; Mr. T. G. Jackson, R.A.; Mr. W. Henry Maw, president of the Institution of Mechanical Engineers; Mr. Francis G. Ogilvie, director of the Edinburgh Museum of Science and Art; and Mr. William Q. Orchardson, R.A.

A Portrait of the late J. F. Bentley, by M. René le Brun de l'Hopital, is exhibited at the new Gallery, where there are also one or two Italian sketches by Mr. Philip Norman.

Two new Board Schools at Newcastle-on-Tyne are to be erected, one in the west of the city and the other in the east. The architect of the former is Mr. Charles Walker, of Eldon Square, Newcastle, and of the latter, Mr. Thompson, of Newcastle.

Partnership.—Mr. George Pearson, architect and surveyor, of 58, Moorgate Street, London, E.C., has admitted his son, Mr. J. Herbert Pearson (who has been associated with him for some years), into partnership from May 1st. The practice will be continued under the style of "George Pearson & Son."

A Church Competition.—The trustees of the Saltburn-by-the-Sea Wesleyan Church recently accepted the plans and designs of Messrs. Garside & Pennington, architects, Pontefract and Castleford, in a competition for a new Wesleyan Church. The church will accommodate 550 and is to cost £6,000, with tower and spire.

New School for Currie, Midlothian.—The Currie School Board has selected the design sent in by Mr. William Baillie, architect, 223, Hope Street, Glasgow. The building is of rubble masonry with dressings of Dumfriesshire sandstone and roofed with green slates. Accommodation is provided for 206 pupils with central hall, cloakrooms, teachers' rooms, &c. The estimated cost for the whole is £2,676.

High Wycombe Town Hall Competition.—The first premium of 100 guineas has been awarded to Messrs. John J. Bateman, Charles E. Bateman and Alfred Hale, of 81, Edmund Street, Birmingham. The second design in order of merit was sent by "F. H.," of 10, Cheyne Road, Chelsea; the third by Mr. J. Edwin Forbes, 21, Waterloo Street, Birmingham; and the fourth by Messrs. Willes & Anderson, of Adam Street, Adelphi, London.

Bradford Town Hall.—The question of the extension of Bradford Town Hall came before a special sub-committee of the Bradford Corporation last week. Plans had been prepared by Mr. F. E. P. Edwards, the city architect, for the provision of an extension behind the present building, on the site of the Old Conditioning House, but Mr. Norman Shaw, R.A., advised that another storey should be placed upon the existing Town Hall, and the committee had this opinion before it last week. A general feeling was expressed that it would prove unsatisfactory to add a new storey to the old building, but for the guidance of the Committee Mr. Edwards was requested to prepare a fresh elevation for a building on the Conditioning House site carried up one storey above the Town Hall.

Castleford Library Competition.—The urban district council of Castleford, Yorks, appointed Mr. Butler Wilson, F.R.I.B.A., as assessor in the competition for the proposed new free library, and he has now made his award as follows:—1st premium to design No. 16, submitted by Mr. George H. Vernon Cale, of 60, Newhall Street, Birmingham; 2nd premium to design No. 110, submitted by Mr. William Bakewell, F.R.I.B.A., of 38, Park Square, Leeds. The assessor has placed the following six designs next in order of merit:—No. 32, Mr. H. V. Ashley, 50, Berners Street, London; No. 113, Mr. Frank L. Heslop, East Parade, Leeds: No. 28, Mr. James Carter, 64, Hinkle Street Darwen; No. 18, Mr. Arthur McKewen, 3, Newhall Street, Birmingham; No. 71, Mr. Henry T. Hodges, 7, First Avenue, Heaton, Newcastle; and No. 69, Mr. A. F. McMilligan, Central Chambers, Castle Street, Liverpool. 124 designs were received, and they were publicly exhibited at the Mechanics' Institute, Castleford, from April 27th to May 2nd.

Mr. John J. Burnet, A.R.S.A., the eminent Glasgow architect, has, on the recommendation of the president of the Royal Institute of British Architects, been appointed assessor for the new infirmary at Manchester. This building is intended to contain accommodation for 500 beds.

The Manchester Society of Architects held its annual general meeting on April 30th, when the following officers and members of Council were elected:—President, Mr. J. W. Beaumont, F.R.I.B.A.; vice-presidents, Mr. John Ely, F.R.I.B.A., and Mr. W. A. Royle, F.R.I.B.A.; hon. secretary and treasurer, Mr. Paul Ogden, F.R.I.B.A.; assistant hon. secretary, Mr. George Brown. Members of Council—Fellows: Messrs. Alfred Darbyshire, F.R.I.B.A., F.S.A., Edward Hewitt, F.R.I.B.A., J. D. Mould, F.R.I.B.A., Isaac Taylor, J. B. Gass, F.R.I.B.A., Jesse Horsfall, F.R.I.B.A., A. J. Murgatroyd, John H. Woodhouse, F.R.I.B.A., and P. S. Worthington, M.A., A.R.I.B.A.; Associates: Messrs. A. E. Corbett, A.R.I.B.A., L. H. Dutch, A.R.I.B.A., and A. H. Mill, A.R.I.B.A.

South Wales Architects.—The annual dinner of the Cardiff, South Wales and Monmouthshire Architects' Society was held on Thursday last at Cardiff, Mr. David Morgan, the president, presiding. Mr. E. Seward proposed the toast of "The Royal Institute of British Architects and the Architectural Association," and Mr. Henry T. Hare, in responding, said the Institute was a national and not a London body, and its desire was to embrace all the architects' societies in the kingdom. Speaking of registration, Mr. Hare said he was not prepared to make a definite announcement, but he would say that the Council of the Institute had come to the conclusion it would not be to the interest of the profession that the Registration Bill should be pressed forward. The objections to the Bill were more on account of details than of broad principle. He had had the pleasure that day of going over their new town hall and law courts, and in the course of his experience he had never seen a more ideal site for municipal buildings than that chosen by the authorities at Cardiff.

At the Royal Academy Banquet on Saturday evening the Archbishop of Canterbury said: "I fear that, though at all times the Church has been bound to welcome the aid of architecture, the view always taken of architectural skill and talent has not been precisely that which we should take to-day. The architecture which two hundred years ago was called into requisition by the Church was not the kind of architecture which we honour with our special praise and admiration now. But to-day I, for one, look forward to no distant date when we shall again rejoice to see our churches clothing their walls with the painter's art, which has been too long banished from them. At this moment there are few of our great churches in England in which great pictures are to be seen. That is one of the strangest and most inexplicable facts—with the exception of the great pictures of Mr. Watts in St. Paul's Cathedral and the picture often referred to by your great predecessor, Lord Leighton, in the village church of Lyndhurst, I can scarcely think of more than two or three examples in any of our leading churches."

Obituary.

Mr. James Cordwell, of the firm of Messrs. Cordwell Brothers, builders and contractors, of Great Marton, Blackpool, died last week.

Mr. Henry Arthur Neal, of Brighton, died last week. He was born in 1834, and was apprenticed to the building trade, acquiring his knowledge of it with Messrs. George Cheesman & Son. Subsequently he carried out the duties of inspector of municipal highways for thirty-one years.

Construction Notes.

The Architect's Knowledge of Construction. THE meeting of the Architectural Association last week was chiefly noticeable for the display of crass ignorance on the part of the majority present of construction and of the results of investigations and tests that have been made. Mr. A. Needham Wilson did good service in renewing attention to the subject of architectural education, in deprecating the waste of time and brains entailed in useless archæological studies, and in adding his testimony to the need for the establishment of a testing institution for the study of materials and methods of construction pertaining to architecture. I am in agreement with him in thinking the Royal Institute of British Architects does not do its duty. When we see the active support given by the Institutions of Civil, Electrical and Mechanical Engineers to the testing and study of practical problems connected with their professions, all must feel ashamed of the architectural profession. The Surveyors' Institution can build for itself a fine large home, but the Royal Institute remains miserably housed because the architects of the kingdom are so selfish (or rather, one would say, foolish and ignorant enough to think they would gain no advantage). But the speakers on Friday evening were mostly crying for the moon. They called for tests to be made which have been already done; they seemed ignorant of the tests carried out, and being carried out, by the British Fire Prevention Committee. As one instance we may refer to the expressed desire to know the behaviour of reinforced or armoured concrete under fire, as though this had not been thoroughly investigated by the French Government, in Germany, and elsewhere on the Continent, and the results to be found in any of the works on the subject. The architectural profession and the building trade are not acquainted with their own literature. The examinations of the Institute and other bodies, and those of South Kensington, are remedying this in some degree by causing students to make themselves acquainted with a little of the immense source of information, but too much time is wasted in study of archæology and crazy methods of setting out the Orders, the Ionic volute, &c., the study of quantity and land surveying, &c. Mr. Wilson rightly insisted upon the need for the study of chemistry and physics, but he did not seem to understand that a real knowledge of these would enable one to judge of the merits or demerits of most of the new materials and inventions introduced. The engineer has a far greater number of important new inventions put before him, and yet is not afraid to use them because as a rule he is able to judge of their value by his general knowledge. Another speaker was not much in favour of laboratory tests, as he thought they could not or did not investigate the points which might arise in practical work, and referred as an instance to the destructive effect in some conditions of the protective substances used in making wood non-flammable. But this is due to the investigator not being a practical man, not being experienced in the trade or profession in whose interest he is working—in not knowing what to look for. This effect of the chemicals used in preserving wood is not new—it has been known for very many years, and a professor who knew his business would especially test for this. All the artistic professions are noteworthy sinners in respect to the neglect of reading and the study of scientific subjects, but unless architects wake up they will find themselves relegated more and more to becoming mere decorators, losing bit by bit the various branches of their art-science to specialists and engineers as they have lost many already (for instance, bridges, ventilation and heating) to the everlasting detriment of architecture. It is not that the field is too wide for competent study. An engineer, and especially the naval architect, has to know much more and more intricate subjects than the general body of architects. The brains of our students are no more puny than theirs, and with efficient education all would be well, though it must be confessed the profession is often made a stalking horse for fond parents to put their dullest children on to. But the architect is called upon to be a leader of men, and we must call upon him to rise to the position—we cannot be concerned if the weaklings sink to their proper position. It should be recognised that the greater artist is the more practical man (indeed, I may say, the scientific man), and without knowledge one may not look for progress—the everlasting cry. H. K. D.

Builders' Notes.

Mr. John Curnock, builder and contractor, of Clifton, who died on March 16th, left an estate of the gross value of £40,534.

The Southport Painters' Strike has been settled after a duration of three weeks. A board of arbitration and conciliation is to be inserted in the rules.

Mr. William E. Farrer, engineer and sanitary specialist, has removed his offices and showrooms from 36, Cannon Street, Birmingham, to Star Works, Cambridge Street, Birmingham.

The New Workhouse Infirmary, Newmarket, has been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their patent Manchester stoves with ornamental tiled sides and with descending smoke flues and patent Manchester grates.

Messrs. E. F. Blakeley & Co., iron roof and building manufacturers, Vauxhall Ironworks, Liverpool, have secured the contract for steelwork at the generating station and car sheds for the Stalybridge Corporation, and the drill hall for the Liverpool Branch of the Navy League.

American Strikes.—General strikes began in New York on May 1st, and 30,000 labourers, mostly Italian navvies, are out, causing delays in the subway works and the excavations for large buildings. Reports of strikes are also to hand from a number of other localities. The demands of the men are mainly for an increase in wages.

The Kitchen Fittings at the New Baltic Exchange have been supplied by Messrs. Benham & Sons, Ltd., 66, Wigmore Street, London, W. They include a large central hot-plate for coal, steam boiling pans and vegetable steamers, a coke grill, various gas hot-plates and other fittings, extensive steam carving tables for the serving room, and various other fittings for still room, sculleries, &c.

The Institution of Civil Engineers held its annual general meeting last Tuesday week, Mr. J. C. Hawkshaw, president, in the chair. Sir William H. White was elected president for the sessional year 1903-4; and the vice-presidents chosen were Mr. Francis William Webb, Sir Guilford L. Molesworth, K.C.I.E., Sir Alexander R. Binnie and Dr. Alexander B. W. Kennedy, F.R.S. The council have made the following awards for papers read and discussed before the Institution during the past session:—A Telford gold medal to Mr. Maurice Fitzmaurice, C.M.G.; a Watt gold medal to Mr. Bertram Hopkinson; and a George Stephenson gold medal to Mr. P. J. Gowan. Telford premiums to Messrs. Charles Hopkinson, B.Sc., Ernest Talbot, F. W. S. Stokes, P. J. Cowan, J. T. Milton and W. J. Larke.

Electrical Notes.

A well-erected Overhead Line can be put up for about 40 per cent. less capital than an underground cable using the same section of copper in each case.

Three-phase Motors for Electrical Driving in Factories are preferable on the score of simplicity, flexibility and reliability, while, if the plant is large, cheapness may also be laid to its credit. Almost the only objection to the system is its inability to meet the demands of such industries as require large and economical speed variation, printing (calico and letterpress), paper-making, &c.

Electrical Work in Russia.—Owing to the lack until recently of electro-technical schools in Russia, the electrical industry there has not made the progress that it has in other countries. There are only two dynamo factories in Russia, which are quite incapable of meeting the demand, and in consequence most of the electrical machinery is imported. Germany and Switzerland furnish the greatest quantity; next comes Great Britain; and then follow the United States, France and Belgium.

Third-Rail Electric Traction.—While electric inter-urban railways or light railways are multiplying very rapidly in the United States, only a very few of such lines, says the "Engineer," are built with the third-rail conductor, the overhead trolley wire being used in most cases even for lines intended for high-speed service. The Chicago and Aurora line is the most important of the third-rail lines, being 56 miles in length, operated by trains of cars on the multiple-unit system at speeds of 50 to 60 miles an hour. The transmission line carries a current at 16,600 volts, which is reduced at two sub-stations.

The Dundee System. — The electrical engineer of Dundee has reported that the electric supply network in the centre of the city is so weak in many places that it is only a question of a few months before a succession of severe breakdowns would take place. The engineer suggests that the distributors be drawn out of the iron pipes in which they are laid, and that three-way distributor ducts be put down to receive new cables with properly-designed distribution boxes. The estimates involve the relaying of 8,300 yds. of three-way ducts and distributors complete with connection boxes, and all the labour involved by the changing over of consumers from the old to the new mains at a cost of £9,843.

German Electrical Industry. — Consul-General Schwabach, reporting on the past year, comments on the general depression in trade and industry which was experienced during the previous year in Germany, and states that it continued to make itself felt, though in a less degree, during 1902. The most unfavourable position of all, he remarks, was that of the electrical industry, only those works keeping going which were sufficiently cautious during the boom of 1900 not to enlarge their premises and increase their expenses without due forethought. Little was done in the construction of electric central distributing stations and of street railways. In the summer of last year a combination of electrical firms was discussed for the purpose of watching the interests of the trade, and at the end of the year and the beginning of this combinations of the largest German firms actually took place—first between the Aktien Electricitäts Gesellschaft and the Union, then between Siemens and the Nuremberg Schuckert Works, which latter firm had suffered very severely from the disastrous crisis of the previous years. A complete amalgamation is not contemplated, but certain branches are combined in order to cheapen the cost of production.

Bricks and Mortar.

Aphorism for the Week.

By much slothfulness the building decayeth, and through idleness of the hands the house droppeth through.—ECCLESIASTES x. 18.

Our Plates. THE premises in Parliament Street, Nottingham, have recently been erected on the site of the "Old Sun Inn," by Messrs. Brewill & Baily, FF.R.I.B.A., architects, as offices, &c., for their own use. The premises consist of two lock-up shops with basements, together with offices on the ground, first and second floors, the upper portion being a residental flat. The exterior is built of red sand bricks, with brick dressings to the windows. The pilasters to the shops, &c., are of black granite, the cornices over the pilasters and also the angle quoins being of stone. The main cornice is of wood, and the roof is covered with tiles. The whole of the woodwork is painted white. The porch is panelled in oak, the entrance-hall, staircase and many of the rooms also being panelled, and the whole of the floors are constructed with solid blocks in oak and other wood. The contract for the brickwork, &c., has been carried out by Mr. Maule, the joiner's work by Mr. William Appleby, the plumbing by Messrs. Humphrey & Co., and the marblework by Mr. Gibson.—Mr. John Belcher's drawing is exhibited in this year's Academy.

The Oxford Martyrs' Memorial. THE memorial to the Oxford martyrs is showing alarming signs of decay. The stone of which it is built is soft and perishable, and standing in so open a spot the result of exposure is shown by the gradual destruction of the carving. Only a few weeks ago an unusually large piece of the stonework over one of the niches in which the figures are placed fell, presumably through the frost which had followed a period of prolonged dampness. The damage is not confined to the actual memorial, but is showing itself in the steps at the foot, which have been gradually forced asunder by the frost. The memorial is one of the earliest works of the late Sir Gilbert Scott, who took for his general model the crosses erected by King Edward I. in memory of his Queen Eleanor. The first stone was laid in May, 1841. The structure stands on a small piece of ground which forms the apex of the angular churchyard of St. Mary Magdalene, Oxford.

The Campanile Bricks. Cav. Giacomo Boni has supplied some interesting particulars of his examination of the remains of the fallen Campanile at Venice. Great numbers of bricks were, it appears, roughly tracked by the makers with all kinds of figures, sometimes with a number, sometimes with a private mark and sometimes with letters. One brick, for instance, had the letters "DCI." impressed on it, evidently a sign that in the particular batch to which it belonged there were a thousand one hundred odd bricks. The shape of the bricks showed that they had been previously used for various purposes. Some had been utilized for arches, some for fortifications, others for tops of walls. The most important feature about them, however, is that they are not Venetian but Roman bricks. This was deduced by Signor Boni from their general appearance, shape and texture. The bricks, apparently, when being manufactured, were not manipulated like modern bricks and made from a mass of clay already stirred up and kneaded ready for use, but were formed from slices of the clay as it was found without its natural layers being disturbed. This process resulted in each individual brick being able to support a weight quite four times as great as that which can be borne by bricks of modern manufacture. One of the bricks, which are of the first century, had marks representing the impression of a horseshoe, thus conclusively proving that horseshoes were known to and used by the ancients. Another brick bore an impression of the tips of a man's fingers pressed quite deep into the clay. Only about one brick in every thousand bears this impression. Signor Boni assumed that this was a private mark, used once for every thousand or so bricks that were baked by the manufacturer. Some of the bricks showed marks left by animals which had been allowed to touch the clay before it had been baked—one showing marks made by a large dog, one by a pig, one by a calf, three by a goat, and several by sea birds.

New Ordnance Survey Maps. IT is due to the laudable efforts of Colonel Duncan A. Johnston, R.E., the present Director-General, that the service of the Ordnance Survey has been improved, especially in the issue to the public of improved maps, reduced from the standard 1in. sheets. Last year the publication of maps of England and Scotland on the scale of four miles to the inch, which were printed in five colours, was commenced, considerably increasing their usefulness in affording an idea of the character of the country represented. A similar map is now being brought out on the scale of two miles to the inch. On these the different tints are not employed in the representation of contours. The contours are outlined, but only the bolder slopes are shown up by stipple, no attempt being made to indicate by shading the gentler slopes. The printed area of each sheet measures 18in. by 12in., and thus covers 864 square miles of country. Each sheet may be obtained mounted on linen and folded between covers so as to fit comfortably into the pocket, and so that any section of it can be consulted without the whole map being opened out. It is not intended that sheets of this map shall be issued for the whole of the country, but for certain areas only. Each sheet is issued separately at the price of 1s. It may also be noted that the last undertaking in the original programme of the Ordnance Survey is now approaching completion. This is the survey map on the scale of ten miles to the inch, which was designed originally as an index to the 1in. map, but was recommended by the Military Map Committee of 1892 for use as a strategic map. The scale has been found useful for many purposes for which the larger maps were unsuitable. Amongst other features are shown towns, villages, all first-class and most second-class roads, railways, rivers and lakes. On this scale the map of Great Britain comprises twelve sheets. Of these, eight sheets have been published in outline, three more sheets are nearly ready, and the last sheet will be published in about three months.

The Bede Memorial. THE work of designing the Bede Memorial has been entrusted to Mr. Charles Hodges, of Hexham, whose knowledge of Anglo-Saxon stones, and whose works—notably the Caedmon Cross, the Acca Cross and the Rothbury Cross—are a guarantee that the monument will be in keeping with the best traditions of Northumbrian feeling and craftsmanship. The cross is to be erected within hail of Monkwearmouth, on Roker Point, where it will be seen by the vast holiday population of Wear and Tyne. The cross, 25ft. high, will be Anglian in form, as being germane to the district and contemporary with Bede's time. The shaft of the cross on the west side will be ornamented with scroll patterns from the Lindisfarne Gospel and from the stones at Jarrow, and will contain, within a twisted loop of the duck-billed serpent seen on the Monkwearmouth doorway, pictorial subjects from
life of Bede. On the east side will be Ro
lettering, giving two extracts from Be
work. On the south side, within a v
scroll, will be carved in alto- and bas-rel
the heads and busts of the friends a
associates of Bede. On the north side
scroll introducing birds and animals spri
ing from a harp, emblematic of his poe
gifts, will show Bede's love of Nature.

Lyceum Theatre. THE Lyceum Theatre, which w
put up to auction the week bef
last, but not then sold, d
not come to the hammer because it
been a failure as a place of enterta
ment, but because the County Council h
adopted a regulation that no woodw
should be introduced into the auditorium
theatres. The Lyceum stands on part of
site of old Exeter House, known previou
as Burleigh House, where Elizabeth's gr
minister lived. "Exeter Change" rose
the ruins of Exeter House, and was fam
in the latter part of the eighteenth centu
for its menagerie of wild beasts.
academy or exhibition room for the Socie
of Artists was built about 1765 from desig
by Mr. James Payne, architect. It is from t
exhibition that the theatre derives its nan
After the insolvency of the Society a porti
of the place was converted into a theatre
1790, and into an English opera house
Mr. Arnold in 1809. Various exhibitio
and entertainments followed. The theat
was rebuilt in 1816, but destroyed by fire
1830. In 1834 the new Lyceum was open
with English opera, but without success, a
seven years later Balfe renewed the attem
Yet in three more years music had departe
and an equestrian entertainment was bein
given. The theatre was designed by
Beazley, architect, who died in 1851, and w
also designed the preceding theatre destroy
by fire and the present St. James's Theat
The interior decorations were made
Madame Vestris's time (1847).

Replica of a French Abbey. THE new chapel in Nort
wood Park Convent, Cowe
has been erected in co
nection with the Benedictine convent ther
It is a replica of the abbey of St. Cecili
Solesmes, which was occupied by these nu
till their departure from France for the Is
of Wight, but is a temporary structure. Th
plan is the same, but much reduced, an
there is no imitation of the handsome decora
tive character of the exterior of the beautif
and costly structure on the Continent. Bu
the *facsimile* is to be found inside. Th
architecture is of the style of the thirteent
century, on a cruciform plan. The nun
choir is the largest part of the church, an
is 25ft. wide and of proportionate length, an
there are two ranks of stalls. At the end
an apse, with the throne of the abbess, an
above is built an organ, which has bee
brought from Solesmes and reconstructed
The grille, which separates the choir fro
the lady chapel (facing the choir), has als
been brought over from the abbey. Spac
is provided for outside worshippers to atten
the services, facing the high altar. It is
timber-framed building, lined with slab
plaster. The columns, capitals, bases an
arches are all cast in plaster, and the whol
of the walls from the floor to the barrel-ro
are white throughout. The floors are all o
terrazzo mosaic. The architect of the new
building is Mr. Williamson, of London, wh
also designed the chapel which has recently
been completed at St. Michael's Priory
Clarence House, East Cowes. This is a
smaller building than that of Northwood
but constructed on the plan of the abbey o
St. Cecilia. Messrs. Godson & Sons are the
builders of the chapel at Northwood, and
Messrs. Brading & Sons, of East Cowes, built
the chapel at Clarence House.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver.]

DURING THE WEEK ending May 2nd eleven failures in the building and timber trades in England and Wales were gazetted.

J. DUNN, road contractor, Harrogate. R.O. April 25th.

F. COUZENS, builder, Cardiff. R.O., April 24th.

A. H. CANNON, builder, Ealing. P.E., Brentford Town Hall, June 5th, at 12.

T. ELLIS, speculating builder, Eastbourne. Liabilities £2,700; assets £3,678.

S. Y. BROCK & SON, builders and contractors, Alburgh. Liabilities £2,586; assets £1,072; deficiency £1,514.

R. RUTTY, late builder, Moseley. Liabilities £119; assets nil.

R. NICHOLLS, timber merchant, Stoke-on-Trent. Gross liabilities £15,319; assets £9,574.

W. SPENDLOVE, joiner and builder, Upper Hartshay Liabilities £737; assets £127.

F. B. COOK, decorator, Reading. First meeting, Queen's Hotel, Reading, May 14th, at 11.30. P.E., Reading Assize Courts, May 14th, at 2.

G. J. GAWLEY, steam haulage contractor, Reading. First meeting, Queen's Hotel, Reading, May 14th, at 12. P.E., Reading Assize Courts, May 14th, at 2.

J. H. BAILEY, builder, High Wycombe. First meeting, 1, St. Aldgate's, Oxford, May 7th, at 12. P.E, Aylesbury County Hall, May 11th, at 11.

A. D. MITCHELL, builder, Derby. First meeting, O.R.'s, Derby, May 2nd, at 11. P.E., Derby C.C., May 12th at 11.

G. B. PHILLIPS, contractor, South Hayling. R.O. April, 21st. First meeting, O.R.'s, Portsmouth, May 6th, at 3. P.E., Portsmouth C.C., May 25th, at 11.30.

F. W. BLACKBURN, builder and contractor, Blackpool. First Meeting, O.R.'s, Preston, May 8th, at 3. P.E., Preston Sessions Hall, May 8th, at 11.

H. N. DAVIDSON, builder and contractor, Stretford, First meeting, O.R.'s, Manchester, May 4th, at 2.30. P.E., Salford C.C., May 5th, at 10.30.

G. BROWN, builder, Anstey. First meeting, O.R.s. Leicester, May 7th, at 12. P.E., The Castle, Leicester, May 8th, at 10.

C. A. FORD, builder, Leicester. First meeting, O.R.'s, Leicester, May 4th, at 12. P.E., The Castle, Leicester, May 8th, at 10.

W. CHAPMAN, builder, Bedlington. R.O. April 20th. First meeting, O.R.'s, Newcastle-on-Tyne, May 6th, at 11.30. P.E., Newcastle-on-Tyne C.C., May 7th, at 11.

G. DIXON, builder, Wallsend. First meeting, O.R.'s. Newcastle-on-Tyne May 6th, at 12. P.E., Newcastle-on-Tyne C.C., May 7th, at 11.

H. E. PERKINS, builder, Stoke Lane. First meeting, O.R.'s, Bristol, May 6th, at 11.30. P.E., Frome Mechanics' Hall, May 12th, at 12.

E. UPHILL, builder and contractor. Bath. First meeting, O.R.'s, Bristol, May 6th, at 12.15. P.E., Bath Guildhall, May 21st, at 11.30.

T. BARNARD, joiner, Portslade and Alresford. R.O., April 29th. First meeting, O.R.'s, Brighton, May 14th. at 10. P.E., Brighton C.C., May 14th, at 11.

J. TAYLOR, carting contractor, Doncaster. First meeting, O.R.'s, Sheffield, May 7th, at 12. P.E., Sheffield C.C.-May 7th, at 2.

J. JONES, mason, Haverfordwest. R.O. April 20th. First meeting, Pembroke Dock Temperance Hall, May 8th, at 12.

T. W. HUGHES, painter, Merthyr Tydfil. R.O., April 20th. First meeting, 135, High Street, Merthyr Tydfil, May 7th, at 12. P.E., Merthyr Tydfil Town Hall, May 20th, at 3.

The following companies are to be wound up:—

BEDLINGTON BRICK CO., LTD.

PFISTER WOOD SYNDICATE LTD., London, E.C.

PRIEST'S POTTERY AND STONEWARE MANUFACTURING CO., LTD., Cardiff. Meeting, 31, Queen Street, Cardiff, May 23rd, at 11, for the liquidator's final account.

PYE-WIPE BRICK AND TILE CO., LTD.

SHORTWOOD BRICK AND TILE CO., LTD. Mr. W. F. Collins is authorized to sell to the Cattybrook Brick Co.

Trade and Craft.

Sinks.

Messrs. Joseph Cliff & Sons, Baltic Wharf, Waterloo Bridge, London S.E., send us a copy of the sink section which forms the second portion of their new complete catalogue, now in course of preparation. This is a well printed catalogue and shows very clearly all the numerous varieties of sinks manufactured by the firm. They are formed of the Wortley fireclay and are coated with the hard "Imperial" porcelain white glaze, perfectly free from lead: but buff-glazing on the outside at the front and ends may be had without extra charge, and sinks can also be finished to order in ivory, French grey and red brown. They are strong and durable, straight and true in shape, and all internal angles rounded to prevent the accumulation of dirt. In the majority of the sinks the waste hole is placed in the centre at the back, the hole being, unless otherwise ordered, 2¾in. in the clear. In addition to the ordinary patterns Messrs. Cliff make a double sink, a combined sink and slop sink, a combined sink and wash-hand basin, extra-deep sinks, laboratory sinks, several varieties of drainer sinks, including a patent "open-overflow"; the "Claybury" hospital sink, combining the level bed of an ordinary sink with a deep bowl; many kinds of slop sinks, with and without flushing rims and some with wood rims; wash-tubs, the improved "Modern" pattern having a high back, covering pieces with soap trays over joints, and ribbed on the inner side of the front; "Yorkshire" brown stoneware sinks, pedestals with both ends rounded, a revolving post-mortem table (as supplied to the London Hospital), mortuary slabs, and Hellyer's patent bed-pan sink and slop sink. It will thus be seen that the catalogue is most complete and up-to-date.

Roofing Tiles.

Messrs. Stanley Brothers, Ltd., of Nuneaton, have issued a new illustrated list of their well-known roofing tiles, pipes, valleys, &c. So great has been the demand for their Staffordshire tiles that the firm has found it necessary to double their works at Burslem. These tiles are made in red and red-mottled; the latter are subjected to greater heat and a prolonged firing, the result being a darker and more modified tone of colour which architects generally prefer. They can be supplied in lighter or darker shades. Tiles are generally fixed on laths or battens, to a 4in. gauge which gives a lap of 2½in., though it is preferable to use special fixing blocks: 50 tiles cover 1 sq. yd., 550 one square of 100ft super. and 1,800 one rood. Where roofs of different pitches intersect, the laths or battens should not intersect also, as the sharper pitch of roof requires a closer gauge. Care should be taken to avoid this error, as otherwise it will be found necessary to strip the laths off he sharper side. Tiles are usually torched (pointed) on the underside with hair-mortar after fixing, and although each tile has holes or nails, nailing is unnecessary. The tiles being approximately ½in. thick, the tails orm a surface which distributes the sweep of he wind during a gale, and as there is no everage a tiled roof will be found intact when roofing of other material is stripped. The tails or lower part of tiles should not be bedded in mortar, as the capillary attraction of lime for moisture causes expansion and consequent risk of damage. Tiles being a lay product do not readily absorb or transmit eat, thereby giving an equable temperature o rooms, being cool in summer and warm n winter; and boarding (sarking) is not so ssential for tiles as for other kinds of roofing materials. When, however, cost is not of rimary importance, boarding adds to the eneral excellence of the roof. Tiles the size of tile-and-half, also half-tiles, are supplied to break joints at gables. Some prefer the latter as having a neater appearance when fixed. Messrs. Stanley Brothers make a short tile 7in. long for a double course at the eaves, and a tile 9in. long to fix immediately under the ridge. Hip and valley tiles are stocked having the contained angle across the hip or valley for slopes of roofs, as well as several patterns of unequal-sided tiles for intersecting roofs of different pitches.

Stuart's Granolithic.

On Saturday afternoon a party of about fifty members of the Sanitary Inspectors' Association (including Mr. Isaac Young, the chairman, and Mr. T. G. Dee, the treasurer) paid a visit to the works of Stuart's Granolithic Stone Co., Ltd., at Millwall Dock. Mr. Peter Stuart personally conducted the party over the works and was very hospitable with his "Cumarachandhu"; while a Highlander made angel music on the pibroch. The members, after visiting the offices and testing-room, were shown the Gates American crusher, where the Dalbeattie granite is reduced to about ¼in., passing between three sets of rolls and being fed by conveyors. After grinding it is mixed with the cement (from Strood) in a worm mixer where the proper quantity of water is added automatically. The material is then moulded in wooden boxes as desired and allowed to set. Special attention was directed to the Granolithic fireproof floors, which are only 3in. thick; small steel rods are embedded in the slabs to take tensional stress. Walls are also formed of Granolithic slabs. Notice was taken of a fireproof staircase and landing which, though only 2½in. thick, will withstand great strain. The works at Millwall Dock are thoroughly up-to-date, electric power being used for driving—the grinding mill is driven by a 60 h.p. motor. A contract for 300 tons of Granolithic work has just been completed by the firm in competition with America, and a very large number of electric street-box covers is being completed for the General Post Office authorities. Some of them were shown to the party, who were interested to see how the full moulds were machine-shaken to get rid of all air-bubbles, so securing a thoroughly homogeneous slab.

"Arrolithic" Mosaic.

The feature of "Arrolithic" marble mosaic, terrazzo and cloisonné pavement is that strips of metal are embedded on edge which prevent the spread of cracks in large areas. The metal is introduced as part of the design, and therefore is not obtrusive: it can be simple or elaborate, and takes the part of the "cloisons" in enamel work. Messrs. Mainzer & Co., of 18, Berners Street, London, W., who work in this new process, have just issued a coloured sheet of very pleasing designs, the cost of which varies according to the intricacy of the work. Architects will doubtless be glad to avail themselves of so useful a check to the spread of cracks.

Marmorite.

A new decorative material is being introduced by the Marmorite Artistique Syndicate, Ltd., of 30, Great St. Helen's, Bishopsgate, E.C. As manufactured originally in Germany it was purely a representation of black marble, but the present composition can be produced in any colour and dealt with artistically for pilasters, fascias, walls and many other purposes. The Marmorite now introduced is a Belgian manufacture, the works being situated at Brussels, where a large business is being done. The material is a by-product of glass with a certain proportion of metal salts; when the material is in a molten state the colouring ingredients are added, so that the colour is therefore not merely a surface colour but extends throughout the substance. It is claimed that Marmorite is less brittle than glass, that it retains its brilliant polish and is unaffected by changes of temperature. The designs for decorative and other purposes are made by the sand-blast process, the painting being done by hand and varnished. Marmorite has already found favour with traders for advertising purposes, many of the specimens exhibited last week at the Trocadero Restaurant having been specially manufactured for the well-known firms whose designs and advertisements appeared upon them.

The Design of Pianos.

Those architects who sometimes design the furniture of a house will find much to interest them in the admirable new catalogue of Messrs. John Broadwood & Sons, Ltd., of 33, Great Pulteney Street, London, W. Twenty-four pianos are illustrated. The first design, modern French, is especially refined, while those in the style of Louis XV. and XVI., Chippendale, Sheraton and Adam are also very beautiful: another fine piano is that after a design by the late Sir Edward Burne-Jones. We notice, too, a piano designed by Mr. Baillie Scott and one by Mr. Ashbee.

New Companies.

MARNER CO., LTD., manufacturers of bricks, tiles pipes, &c., 26, Bermondsey Wall, S.E. Capital: £10,000 n 20 founders' shares of £100 each and 8,000 ordinary shares of £1 each.

THE

BUILDERS' JOURNAL

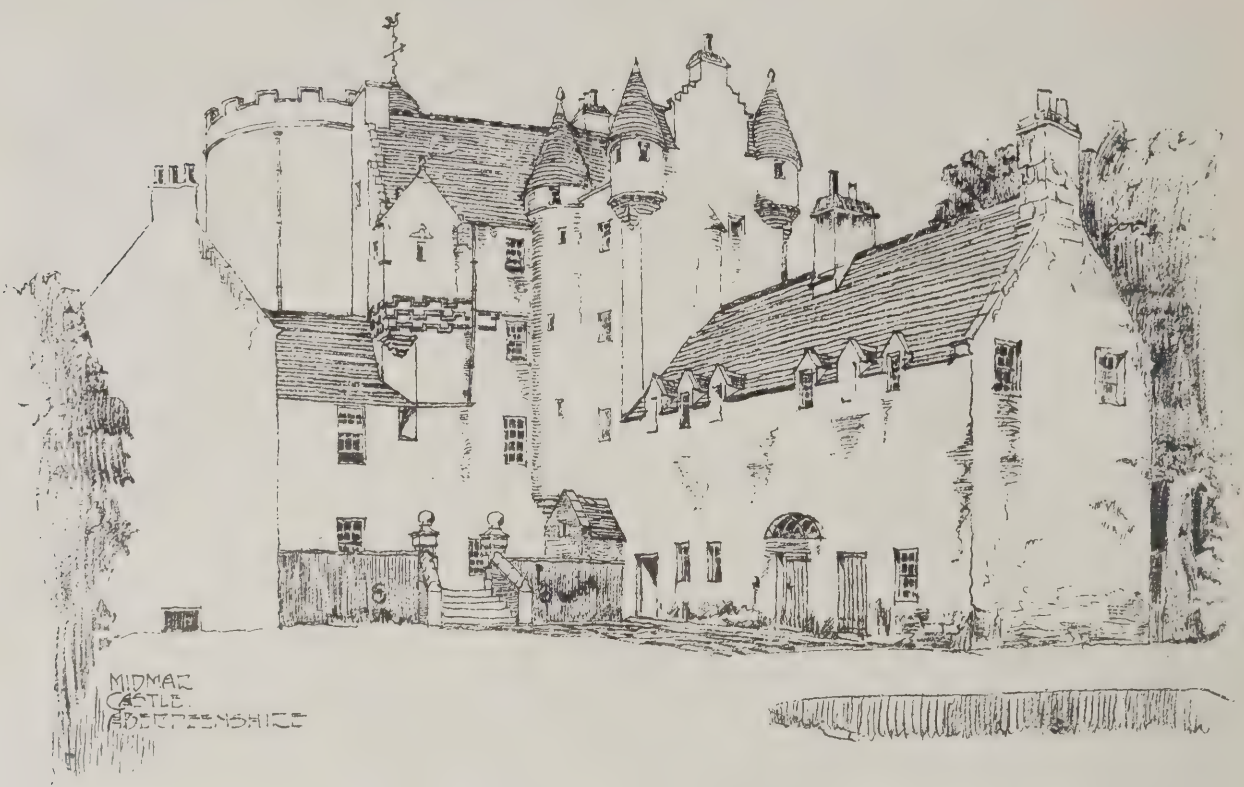
AND ARCHITECTURAL RECORD.

May 13, 1903. Vol. 17, No. 431. 9, East Harding Street, E.C.

The Strand "Island." MR. HAMO THORNYCROFT'S suggestion about the widening of the Strand in connection with the new street is certainly one that merits attention, though we fear it will not be adopted by the Council. As set out, the frontage line of the "island" site juts awkwardly into the Strand at its eastern end. Mr. Thornycroft proposes that this corner should be cut off. The two chief advantages are of course that the Strand would be made a uniform width of 130yds. at that part, and going eastwards the vista would have the church of St. Clement Danes in the centre and the line of the Law Courts to the left. In the small plan published by the "Times" we notice Mr. Thornycroft has made the Strand look a good deal narrower at the end of Aldwych than it really is: but we must grant him some allowance to emphasize a difference. "I am confident," he says, "that unless the line of the north side of the street is thrown back as suggested the general effect of the 'improvements' at this point will be a constant eyesore; not a crookedness which is picturesque, but an unfortunate crookedness, yet one which, happily, there is still time to avoid." To cut off the "island" corner as proposed, reducing the frontage to the new crescent by about 60ft, would naturally be sacrificing considerable revenue: but we trust the Council may still see their way to do this.

Not a Vandalism. WE are glad to see that some of those responsible for the scheme have come forward to explain that the proposed erection of a Carnegie free library next to Shakspeare's birthplace at Stratford-on-Avon will not encroach on the world-famous dwelling nor be a disturbing element in the street. Mr. Edgar Fowler, chairman of the Trustees' executive committee, says the cottages (which are modern) are not to be pulled down to make way for the library but to extend the garden and isolate the house from danger by fire, and, further, that the library itself is not to be a "palatial modern structure" but "the careful restoration of an ancient but dilapidated and wretchedly-modernized house and the filling-up of a vacant piece of ground adjoining the School of Art (a space caused by a fire) with a building suitable for its purpose and situation." Mr. Robert Sydney Laffan, formerly headmaster of King Edward's Grammar School at Stratford, has also come forward with some satisfying particulars. He explains that the garden eastwards from the birthplace is 37ft. 6in. wide to the cottages with which the Library and School of Art Committee propose to deal. By pulling down the four nearest an additional 45ft. will be added to the garden. Of these four cottages the two nearest the birthplace, which were formerly one house, were entirely reconstructed about the first half of the nineteenth century. The front and back are quite modern, the only old portions being one upright timber built into the wall at the back, and the lower part of an old chimney. The next two cottages are absolutely modern structures. Next to these stands the only house which has any antiquarian interest. It is at present occupied as a china shop, and presents from the front the appearance of a modern red-brick building; but it was originally a timbered structure of the Tudor period, and of this original building some fragments still exist. The two gable ends and some of the lower parts of the chimneys remain, and one old room still shows in a partition the massive timbers of sixteenth-century construction. The overhanging timbered front of the original building has unfortunately disappeared and been replaced by a common 9in. brick wall. When the property came into the possession of the committee, Mr. J. A. Cossins (the architect appointed by the Society for the Protection of Ancient Buildings) was called in to advise as to the treatment of this house. At first Mr. Cossins reported that owing to the dilapidated and combustible condition of the property a complete rebuilding would be necessary; but after going very carefully into the matter he came to the conclusion that a part at least of the remaining ancient timber-work was capable of preservation. It is hoped that when modern additions have been removed sufficient indications of the ancient roof and timbers may be found to guide the architects in making such a reproduction as shall preserve the character of the house. The committee propose to carry out this reproduction, and to build on the vacant plot to the east of this house a low two-storeyed building of similar character (which we trust will be solid and not packing-case work) covering the exposed red-brick wall of the School of Art, and presenting to the street a timbered front. We notice that the matter was brought up in the House of Commons last Thursday by Mr. Yoxall, who also asked the First Lord of the Treasury whether he would consider the advisability of appointing a committee "to enquire into the propriety of establishing a national trust for the consecration of buildings of historical or biographical interest within the United Kingdom." Mr. Balfour said he was not clear how this was to be done, nor of the precise meaning of "consecration." If it was to include purchase, compulsory or otherwise, by the State of all buildings now in private ownership which are of historical or biographical interest, the scheme seemed to him to be impracticable. If it fell short of this it would hardly be efficacious.

The Solution of the Labour Problem. WHILE Mr. Carnegie's name is concerned with the library at Stratford we find it also connected with a far more important matter, namely, as the newly-elected president of the Iron and Steel Institute and the address which he delivered before that body on Thursday last. Mr. Carnegie dealt with the relation of capital to labour and the desirability of giving the actual producers a share in the profits. So far as the building trade of this country is concerned, it is hardly feasible just yet that such a scheme could be carried out, but long since there have been rumours of great firms amalgamating, and with the capital then combined some scheme of profit-sharing might be tried. It is not ill-considered socialism, as the results in the American steel trade show very plainly. The Carnegie Steel Company found it good policy to take in forty young partners—business men – who are now rich: but they also found how much depended on the mechanical men, the superintendents and foremen. To one of these Mr. Carnegie offered a partnership, but he preferred to be left as he was—"and just give me a thundering salary." Mr. Carnegie gave him the salary of the President of the United States, and looked about for other men equally capable. From that time onward the union of the mechanical and business partners went steadily forward, until no manager of a mill was without his interest in the business, as pertaining to the position, and no board of management or important committee was without a mechanical representative. The United Steel Company, the largest of all industrial corporations, found it to their interest to adopt a joint-stock scheme with shares in small amounts, easily distributable among thousands of workmen: and it is this co-interest to which Mr. Carnegie looks so hopefully for the future—when it shall be the rule that the workman is partner with capital, the man of affairs and the working man both owners in the shares and equally interested in the success of their joint efforts.



SCOTTISH DOMESTIC ARCHITECTURE.

THE CULMINATING PERIOD.

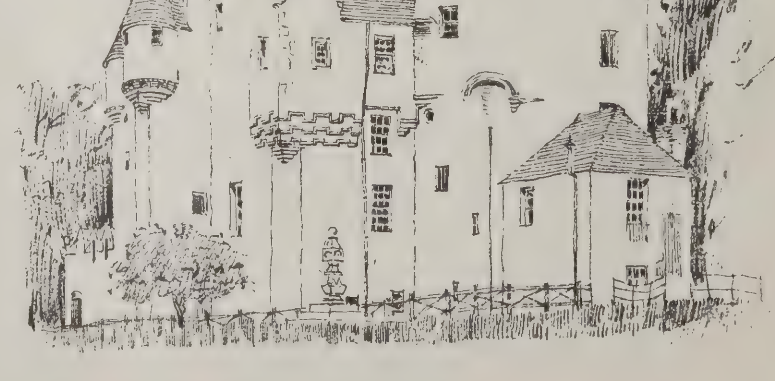
By **ANDREW ROLLO.**

THE castles here illustrated, with the exception of Aboyne, are all of what has been termed the culminating phase of the Scottish domestic style, dating from about the middle of the sixteenth century to the latter end of the seventeenth—that phase which gradually gave place to the Renaissance, of which some features, notably the balustraded parapets and ogee turrets, are early apparent. The castles are in some cases fortified, having loopholes for musketry, though they retain all the features of the earlier periods of the style, such as corbelled parapets and overhanging turrets. The development of such features may clearly be traced throughout the progress of the style; the general impression that French influence is shown is considered by some authorities to be erroneous. The castles are, however, built with much more regard to the comfort of the inmates than previously, being often profusely decorated in the "halls," and other parts; and externally, notably in the case of the later part of Drum, a simple, dignified and domestic character is imparted to the architecture.

The plans, of **L**, **Z** and other forms, are entirely peculiar to Scotland. The angles, both internal and external, are frequently corbelled out and utilized as the usual spiral staircases, which are invariably carried up as circular turrets. These spiral stairs, however, in some few later examples, give place to the more convenient and more commodious straight stairs.

The Aberdeenshire castles are generally built of granite rubble, in some instances rough-casted on face, and this greatly accounts for their peculiar simplicity of detail. It may be observed that the richness of design is mostly concentrated towards the top, though it is found that each particular structure is of one date. This concentration of detail may be accounted for by the continued necessity for defence, and by the fact that some castles were encircled by a courtyard in which were erected the offices, and by a turreted wall as a further measure of defence.

It is evident that Professor Kerr (*vide* "The English Gentleman's House") was quite mistaken as regards the true inwardness of Scottish architecture, and must have been acquainted only with those heavy and crude examples of the modern revival of the style in the early part of last century, when he states that "the Scottish baronial style," as it is commonly designated, "is especially an uncivilized style, and ought never to be brought into juxtaposition with anything more highly cultivated than the beautiful heather-braes of Loch Lomond or the fir-woods and birch-covered banks of the Dee"; and, again, that "the ornamental character of the style is simply uncivilized, and must be considered as such." But the Professor is good enough to allow that "in Scotland the style may be accepted on traditional grounds, or even admired as in harmony with much of the scenery of the country." Professor Kerr's knowledge of the style might be illustrated by comparing the later part of Aboyne, which is more or less heavy in character, with the earlier part, which, though solid and dignified, certainly cannot be called crude.



GOVERNMENT BUILDINGS.

A Corps of Constructing Engineers.

A PAPER on this subject was read by Capt. John Sewell, Corps of Engineers, U.S. Army, at the last Annual Convention of the American Institute of Architects held at Washington. Capt. Sewell said :—

Probably everyone here present will accept it as axiomatic that the design and erection of Government buildings should proceed according to some well-studied and businesslike system. This should be broad enough to cover the reasonable requirements of every individual case, yet sufficiently well defined to ensure always the maximum economy and efficiency ; it should also ensure the placing of both responsibility and credit for all work where they properly belong.

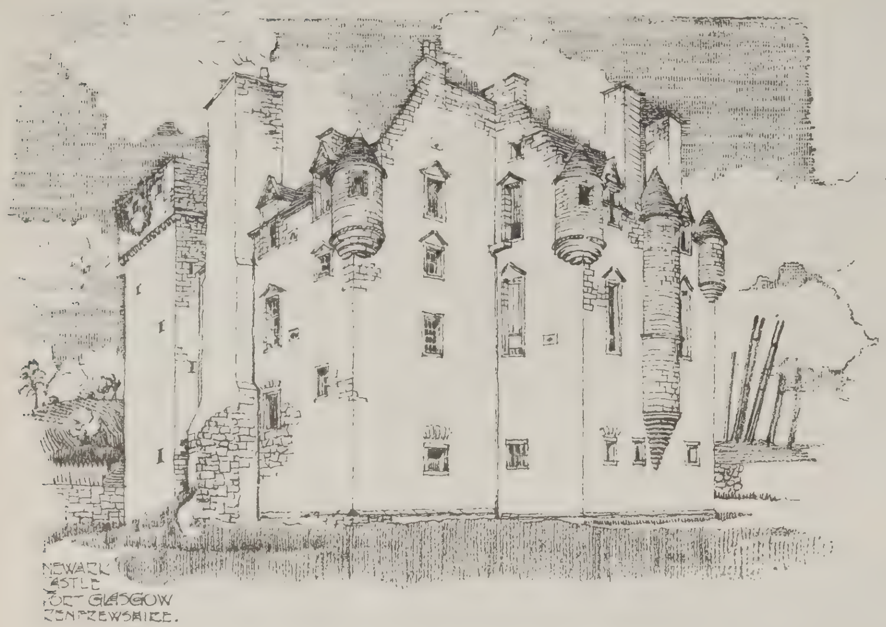
That there is no existing system of general application is amply demonstrated by the history of Government buildings everywhere, both completed and building. Certain departments of the Government which have considerable building work to do proceed in a more or less systematic manner ; yet not one of them adheres always to its own general methods, and certainly no two of them handle the work in even approximately similar ways. Possibly one reason why the problem has not been definitely solved before this is that it is capable of more than one solution, and is, to that extent, indeterminate. However, there must be some one solution that is better than any other, and there seems to be abundant evidence that it is yet to be found. There is much complaint on the score of artistic merit or structural excellence or economical execution in many of the buildings erected under any of the existing systems ; while most of those which escape adverse criticism have been handled in some special way not susceptible of general application.

In what follows it is not claimed that this best solution is necessarily to be found ; it is only an indication of lines along which the writer believes a system could be developed capable of handling all cases likely to arise in ordinary practice with reasonable satisfaction to all concerned.

Inasmuch as both architects and engineers have much to do with the design and erection of modern buildings, and neither can do entirely without the other, it would seem to be a matter of prime importance that they be definitely settled in their proper relative positions in the beginning. This is a matter of more importance in Government work than in private work, because of its greater extent under one ownership. The writer's plan, without elaboration of details, is simply this : The engineer should be a Government official, with authority to disburse funds and make contracts ; the architect should be in private practice. The architect, selected in some proper way, should in general be responsible for the design of the building, and the Government through its own engineers should erect it. If the Government could develop a corps of salaried architects, with sufficient artistic ability, it would be manifest economy to do so ; but the very nature of the case seems to make this impossible, and there is undoubtedly a very general sentiment that a " plan factory " is not conducive to the highest artistic excellence in building design. With this sentiment the writer is in thorough accord so far as artistic features are concerned, though he believes that a well-conducted " plan factory " is an excellent thing when it comes to structural and other engineering work ; so that he would always advocate the retention of a good architect in private practice for the design of a Government building. He would for all important work limit the selection to architects of well-proven ability. But on less important works the competitions, or methods of selection, should be so devised as to give the younger men a chance to win if they can. It is not necessary to go into details on this point, since this paper is merely an expression of opinion on the part of an individual, and not a probable basis for official action.

Now, coming to engineers, there is no doubt that by a proper system of selection and tenure of office the Government could get an abundance of competent engineers at moderate salaries to look after the execution of its building work. These men could easily be trained so as to do away entirely with the general contractor, and even with many of the sub-contractors, at a financial profit to the Government and with considerable improvement in the standard of work. They would also be in a position to standardize many of the features of building design, which are now sadly in need of it. For instance, among the many so-called systems of fireproofing on the market some leave little to be desired, some are very good, some fair and many are wholly bad. A corps of building constructors employed by the Government would be in a position to definitely settle which were wheat and which were chaff, and draw the line between them.

FYVIE
CASTLE
ABERDEENSHIRE.



Certain column-sections are structurally good, others structurally bad; under present conditions quite a percentage of the latter find their way into Government buildings. The same is true of other details in all lines of building work, and this could be corrected by a construction-corps such as that now suggested. Above all, such searching inspection could be provided that the standard of workmanship would be materially raised. Contractors would be forced to learn that good work can be executed as cheaply as bad, and it is not too much to claim that the general elevation of the standard on Government buildings would exercise a similar and much-needed influence on private work. A corps of building constructors or well-trained and competent engineers could therefore determine the best type for the various structural features of different classes of buildings; they could standardize specifications for both workmanship and materials; they could prepare the engineering plans themselves, if that proved advisable, or, if not, they would at least, by the results of their investigations with the resources at their command, greatly simplify the architect's work on all but the purely artistic parts of the design. They would make all the contracts, control the various contractors, and be responsible that the approved design was properly and economically executed. But the architect's duties should so far overlap those of the constructing engineer that it should be his province to consult with the engineer on all points affecting the artistic value of the building, and on these points his authority should be superior to that of the engineer, except in those cases that occasionally occur where an effect is mistakenly sought at the expense of sound construction. In any event, the engineer, if he happens to take a narrow view of the artistic, should not be allowed to spoil the design, any more than a general contractor in a similar position.

So far the advantages of the proposed arrangement seem to be mainly on the side of the Government. It may be claimed that a competent architect and an honest contractor could take a Government building on the same terms as a private one, and execute it with economy and a high standard of workmanship. This is perfectly possible but by no means certain, because the contractor is often a very uncertain quantity, and must in any case have a profit, most of which could be saved by the method here outlined.

It is almost certain that the average engineer, if left entirely to himself in the design and execution of a building, would produce at least a few architectural absurdities; possibly, as an engineer, the writer may be so bold as to suggest that he has seen evidence that very good architects are sometimes a little weak on the purely engineering features of their work, as well as the relative economy of different details that are otherwise equivalent. He might possibly further suggest that it is here the engineer should come in; and if the architect has the benefit of the serious thought of many well-trained engineering minds, instead of only one or two, the result is much more certain to be good. This is at least a fair argument for the architect and a regularly organized corps of constructing engineers, as against the architect and a clerk of the works or engineer in private practice employed by the architect to supervise a particular building.

In any event, in Government work the money must be expended according to law and regulations, and every penny accounted for with a rigidity almost unknown in private work. Contracts must be made in accordance with a mass of statutes, rules and decisions that bewilder anyone not brought up among them. Any reasonable and necessary thing can be done if one knows the established method of doing it, but, regardless of what the object may be, if the act is not in due form payments will be stopped and contracts declared illegal by the accounting officers of the Treasury; contractors will not get their money, and the architect will probably feel that the tangle is utterly hopeless. The money must be disbursed by some Government official; if the architect has the supervision of the work, and certifies the payments due to the contractor, the disbursing-officer will probably be a man entirely without a technical knowledge of building, and it may be quite possible for him and the architect to disagree as to whether a given payment is actually due under the contract. Unless the architect were bonded and held financially responsible for the payment, he could not compel the disbursing-officer to make it in such a case, and it might result in tying up the work. The path of the uninitiated, in incurring liabilities and making disbursements on behalf of the Government, is beset with pitfalls such as those indicated above; travelling expenses, award of contracts under the law relative to the lowest bidder, employment of expert help—in fact, every step from start to finish, even the architect's commission, is liable to make him wish he had never heard of a Government building. Of course, if the disbursing-bureau is always in a broad and friendly frame of mind these difficulties will be smoothed out, and the architect may never dream of their existence; but such a system could be entirely upset by a very little personal or professional jealousy, and it seems to the writer that this possibility

should be removed. He feels confident that the division of responsibilities suggested in this paper would remove it.

Naturally, a good many questions of detail will at once be raised in considering the probable workings of any proposed new system. Possibly it may be worth while to raise one or two now and attempt to answer them.

It may be asked: If this building-bureau *personnel* is made up entirely of engineers, who will decide between the various architects in a competition? Who will upon the artistic merits of the designs? There should be a board of, probably, three eminent architects in private practice, retained to advise the constructing-bureau in such matters, and their decision on artistic questions should be final. Of course, no one directly or indirectly interested in the competition should be eligible for membership on this board. The building once awarded to an architect or firm of architects, they should be left entirely untrammelled in their work; the writer thinks this is more certain to follow if the constructing-bureau is avowedly not composed of architectural experts. A little advice from the board of consulting architects should be a sufficient check on the design, if any is needed.

Inasmuch as architects, like the rest of mankind, are dependent for their existence upon a certain amout of the things that only money can buy, the question of compensation may also be raised. It is assumed that if the architect prepares all the plans and specifications, the usual percentage for such work would be a proper commission; it ought to be more liberal under the system here outlined than any other, because so much of the engineering and structural design would be covered by the standard details and specifications of the constructing-bureau. Fewer drawings would be required, and the specifications would demand not more than one-fourth of the usual amount of attention.

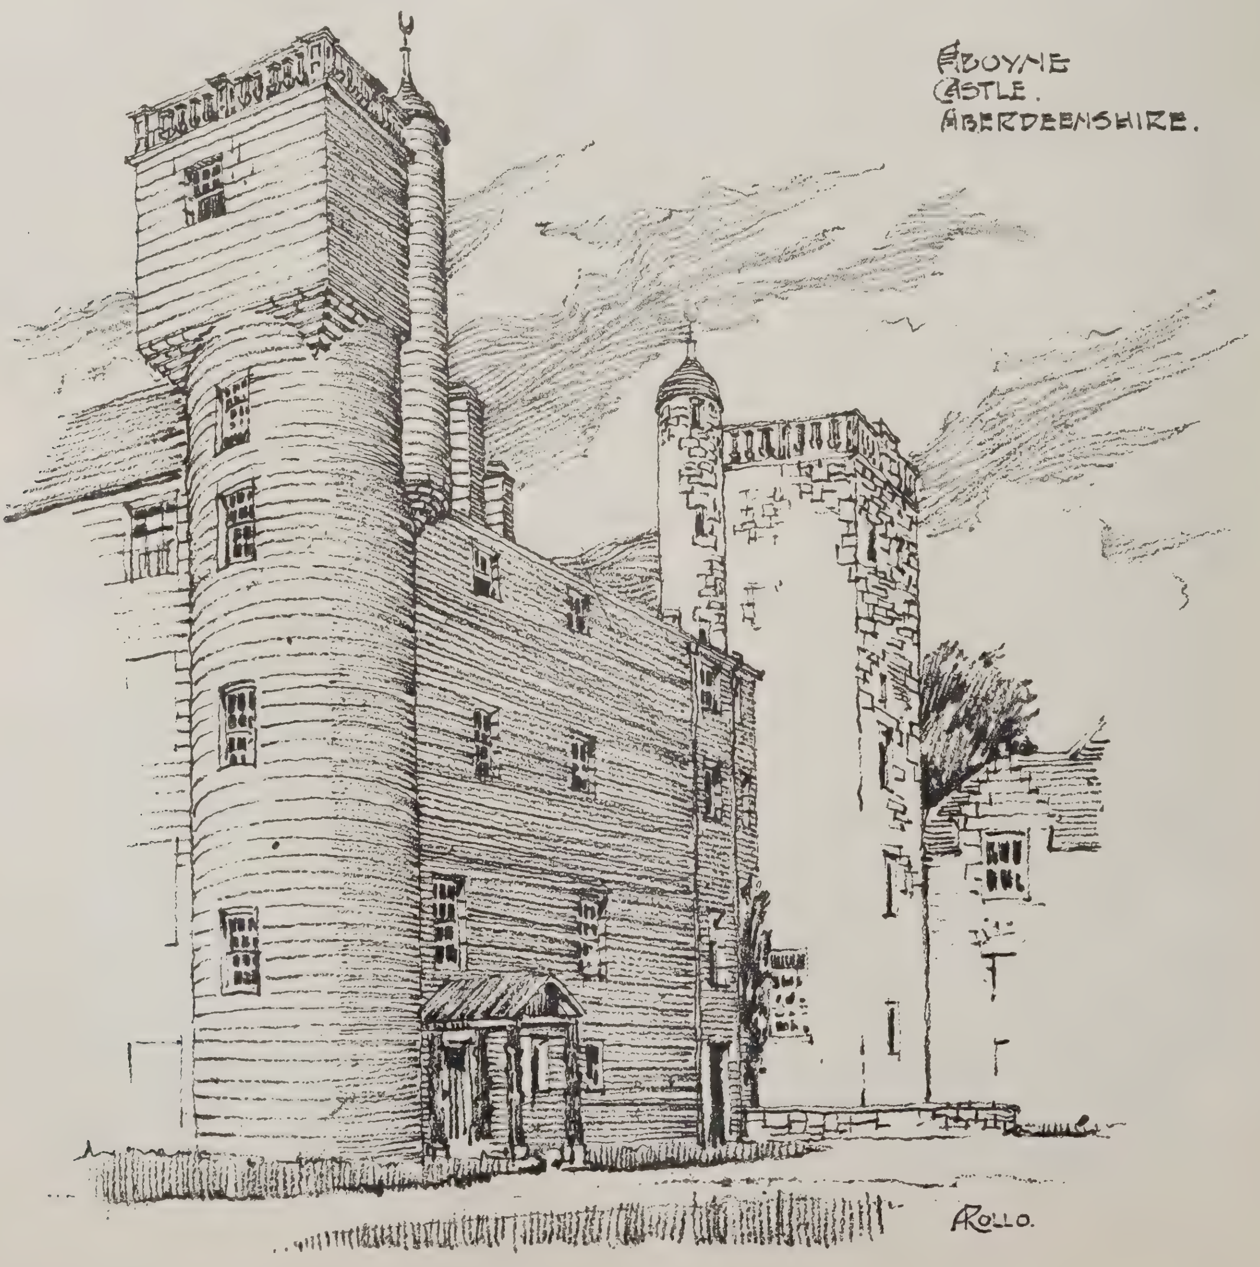
In case the constructing-bureau did away entirely with general contractors, as the writer thinks it should, there would be a very decided economy in having the drawings for the steam, sanitary and electrical work, and also for foundations, structural features and fireproofing, made by its own draughtsmen; in this case the drawings could be made to serve at once as a basis for contracts for materials, as well as to interpret the design. The writer thinks this

might be arranged with justice to all concerned by having the architect supervise the preparation of these drawings, and paying him the full commission less only the usual cost of such drawings to the architect himself. If this is not satisfactory, some arrangement could be devised whereby the Government could secure this economy in the preparation of the drawings and yet not be niggardly with the architect. Possibly, to make the nature of the proposed economy plain, the writer should explain that his idea of the best way to let Government contracts is to get unit prices on carefully classified and accurately scheduled bills of quantities. This puts the proposition before all bidders in the plainest and simplest form, encourages the lowest possible figures, and secures bids in many cases from responsible parties who have not the time to survey the drawings for themselves. It also provides automatically for extras, since they can always be paid for, under the contract, within the limit of variations allowed in the quantities. It requires that the quantities shall be accurately figured from the drawings, and this can be done while they are in course of preparation, practically without extra cost, if the work is organized from the start with that end in view; whereas if done afterwards it sometimes costs almost as much as the drawings themselves. In any event, if it were always accurately done by the Government, it would not have to be done many times over by all the bidders; this would reduce the cost of bids as well as the percentage of contingencies on the contract itself, and, if generally understood, would reduce the cost of the work to the Government.

Probably other minor questions of detail would be raised and would have to be met; but the writer has no doubt whatever that if he has succeeded, even partially, in answering those suggested above, all the others could be disposed of without any trouble.

THE FIRE EXHIBITION.

THE International Fire Exhibition at Earl's Court was opened by the Duke of Cambridge on Wednesday last, when a great many foreign representatives were present. Besides the usual fire exhibits on the numerous stalls several loan collections of photographs, drawings, &c., are shown, and materially add to the interest of the exhibition. The German exhibit is especially interesting. We hope to publish a special illustrated supplement dealing with the exhibition within the next few weeks. On Wednesday evening at the Criterion Restaurant the Executive of the British Fire Prevention Committee entertained at dinner the foreign fire chiefs and surveyors, Mr. Edwin O. Sachs presiding, and Mr. Ellis Marsland, hon. secretary, occupying the vice-chair. The toast of the evening, given from the chair, emphasized the vital importance of the fire-preventive side of fire protection and the great work which was being specially done in that direction by some of the foreign fire chiefs present; this toast was responded to by Count Kamarowsky (Russia) and the chief officers of Berlin, Hamburg, Bremen and Ghent. The toast of "The Visitors," proposed by Mr. Marsland, was responded to by Sir Vincent Barrington (Metropolitan Asylums Board), Councillor Bamberg (Berlin Corporation), Mr. P. Cremieu-Javal (chairman of the London Exhibitions) and Lieut.-Colonel Fox (London Salvage Corps). The toast of "The Fire Service" given by Mr. Max Clarke, was responded to by Firemaster Pordage, of Edinburgh and the hon. secretary of the National Fire Brigades' Union. Through all the speeches ran a current of conviction that greater stress must be laid on fire-prevention even than upon fire-extinguishing, and that the Committee's work in this direction was already bearing tangible results. On Thursday evening Councillor Bamberg, of Berlin, and the chief officers of the fire brigades of Berlin, Hamburg and Bremen entertained the members of the Executive of the British Fire Prevention Committee at a dinner held at the Café Royal, Regent Street, W.



Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Robing-Room to a University Hall.

GLASGOW.—GRAFTON writes: "For what purpose is the robing-room used as an accessory to a university hall? Does it require special fittings of any description?"

It is simply a dressing-room, with lavatory accommodation, hat pegs and chairs, where the Fellows and other officials can put on their robes before proceeding to the platform or stage.

Books on Carving and Woodwork.

GLASGOW.—ENQUIRER writes: "Are there any books on carving?"

"Hints on Wood-Carving for Beginners," by Eleanor Rowe (1s.); "Details of Gothic Wood Carving," by Frank A. Crallan (£1 3s.); "Ecclesiastical Woodwork," by T. Talbot Bury (8s. 6d.); "Examples of Wood-Carving from the XV–XVIII Centuries," by A. Roeper and H. Boesch (£1 10s.). These can be obtained from Mr. B. T. Batsford, 94, High Holborn, W.C.

Rough-cast: Oak Gate-post.

COVENTRY.—CONSTANT READER writes: "(1) Is the face of the brickwork in the accompanying illustration (not reproduced) rendered in cement and afterwards painted in the ordinary way, or distempered? (2) I fixed four oak gate-posts twelve months ago and left them rough: ought not they now to be oiled and the cracks filled in?"

(1) The brickwork is cement rough-cast, made and used as explained on p. 440 of our issue for January 9th, 1901. (2) We do not advise anything to be done to the oak except to protect the top of the post by covering it with another piece of wood to prevent the rain soaking in. The cracks cannot be remedied. African oak is the best to use for outside work.

A Leaky Lantern Light.

IPSWICH.—CYRIL CATCHPOLE writes: "The accompanying drawing (not reproduced) is a full-size detail section of a lantern light to a billiard-room. The roof is a concrete flat covered with asphalt, and the asphalt has been dressed up around the deal curb and tucked into the oak sill. But the lantern light leakes considerably when it rains. The water drops from underneath the pitch-pine condensation moulding. I have therefore had the moulding taken down at one end. I thought at first there was a faulty joint between the asphalt plinth and the oak sill, so I had a fillet of red lead put on to make a tight joint, after which a lead flashing was dressed on top of the oak sill and tucked into the water check, and a red-lead joint made. The lead was also dressed about 2in. on to the asphalt flat with a loose joint and just raised where opposite the condensation outlet. The water, however, still continues to get in. How can I remedy matters?"

You should examine further whether, owing to a shake or other defect in the pitch-pine, it is possible for rainwater to reach the bolt hole of the bolt which binds the steel joist, curbs and oak sill together. It is possible (if the bolt is an easy fit for the hole through the oak sill) for water to reach the joint in this way as shown by the red line on your drawing. If you are satisfied that the work is secure here, the next thing to examine is the glazing. Rainwater is often blown up by wind in considerable quantities between panes at the laps. These spaces may be kept filled with water by capillary action, and wind-pressure from the outside will make the water overflow on the inside. It might be supposed that this water should escape like condensation water, and so it does; but does condensation water escape? What kind of joint is made between the ½in. lead-pipe outlet and the lead gutter on the pitch-pine moulding? Condensation water and water from the glass has (*a*) a chance of entering the pitch-pine sill through sash-bar mortices; (*b*) the joint between the pitch-pine sill and oak sill (this does not appear to happen); (*c*) the joint between the oak sill and deal curb (I think the defect is here). I assume from the expression "when it rains" you take it for granted that it is the outside rain which actually comes in: it is, however, to be considered that condensation is most considerable when it rains if there is a supply of moist warm air inside. But I judge from the data given that, whether rainwater actually comes in or merely increases the rate of condensation, the remedy is the same. If there is considerable condensation this will tend to keep the woodwork constantly moist and ready at all times, on the slightest provocation, to conduct water by capillarity—the supply is made continuous either by puffs of wind or by gravity. The skylight should have ample ventilation, which should be constantly promoted in dry weather by whoever has charge of the place. If you consider my general suggestions you may discover defects which have hitherto escaped your notice and which have obvious remedies. In the meantime I suspect the joint between the edge of the lead condensation gutter and the oak sill, and the joints of the ½in. lead pipe with the gutter. There is no magic dealing with the business; it is a matter for careful examination, discovery and remedy. P.

Drawings for the National Competition.

BELFAST.—PERPLEXED writes: "(1) What kind of measured drawings are required for the National Competition—rough or finished? (2) If finished drawings done in the school from the actual measured sketches were sent without the latter, how would that affect the competitor? (3) Would the headmaster's certificate be sufficient evidence that the competitor had actually measured the work?"

(1) Only finished drawings are required to be sent. (2) Sending measured sketches does not affect the award. (3) The work is taken as having been done under the supervision of the master (where the student is a registered student), and his certificate should be sufficient.

Buildings to Measure around Barnsley.

BRADFORD.—JORDAN writes: "Kindly name some buildings within eight or ten miles of Barnsley suitable to measure."

Roystone Church, 5 miles from Barnsley, is a very interesting church (Decorated and Perpendicular) erected by the monks of the Cluniac priory of Monk Bretton. There is an almost perfect list of vicars of Roystone from 1234, when Richard de Wallington was instituted on the presentation of the prior. The church has a very peculiar feature, of which only one other is believed to exist in England, viz., a chamber with an oriel window half way up the tower on the west side. It was probably made either to hold a light as a beacon for the guidance of the monks from the monastery to the church or for reading and meditation. There are some well preserved frescoes over the chancel arch, and a singular monument to Sandford Nevile, 1172. Darfield Church, also 5 miles from Barnsley (Decorated and Early English), is well worth a visit on account of its details, especially the Decorated tracery of the south aisle and clearstory windows. At Monk Bretton, 3 miles from Barnsley, there are a few remains of a Cluniac priory with a good Perpendicular gatehouse. M.

St. Margaret's, Westminster.

LONDON, S.W.—J. A. E. writes: "Kindly give a brief account of St. Margaret's Church, Westminster. I wish to measure part of it for the Board of Education examination."

St. Margaret's Church, Westminster, was founded in 1064 by Edward the Confessor. It was rebuilt in the reign of Edward I., but was reconstructed two centuries later in the Perpendicular manner. At this time the level of the churchyard was considerably lower, and the church was approached by flights of steps. There were chapels to SS. Margaret, George, Catherine, Erasmus, John and Cornelius. The position of these is not known with certainty, nor the extent of the chancel, which has probably been curtailed in length. In the reign of Elizabeth the stained glass, stallwork, screens and frescoes were destroyed, but the church received in exchange "the queene's armes in coolers and sundrie pewes." After the appropriation of St. Stephen's Chapel by the House of Commons, St. Margaret's Church was regarded as the chapel of the House, and in 1650 a Parliamentary grant of funds was made for structural alterations. Similar grants have been made since. In 1735 the church was repaired at the national expense, the tower being faced with Portland stone and heightened by 20ft. The tower is now 85ft. high and contains ten bells. In 1758 the parishioners purchased the present east window, perhaps the most celebrated in London. It was painted at Goude in Holland for Henry VII.'s chapel, but that monarch having died before its completion it was presented by his successor to Waltham Abbey. The last abbot of Waltham took out the glass from his church in 1540 and sent it for safety to his own chapel at New Hall, Essex. Here it survived the dangers of the Reformation and passed into the possession of General Monk, who, to preserve it from Puritan bigotry, buried it in the earth. At the Restoration it was replaced, only to become endangered by the decay of the mansion and chapel. It was purchased by a Mr. Conyers, of Copt Hall, whose son sold it to the parishioners of St. Margaret's for 400 guineas. The dean and chapter of the abbey then instituted a lawsuit against the parishioners on account of the "superstitious image or picture," but after seven years judgment was finally given in favour of its retention. The window illustrates the Crucifixion, but contains also full-length figures of SS. George and Catherine, Prince Arthur (Tudor) and his wife Catherine of Aragon. The east end of the church was now (1758) made internally apsidal (semi-hexagonal) and a chancel arch formed, and this arrangement continued until Sir Gilbert Scott's restoration in 1877–78. At this time the galleries and pews were removed, the organ (hitherto at the west end) re-erected at the east end of the north aisle, the west window reopened, the tracery of the clearstory windows renewed, the plaster ceiling removed, and a new oak roof erected, together with reredos, credence table and other fittings. Since then stone-vaulted porches have been built at the east and west ends (? Somers Clarke, architect) and the church so enriched with monuments and stained glass that Sir Charles Barry's proposal for its removal is not likely to be revived. There are memorials to Caxton, Raleigh, Milton, Admiral Blake, Phillip Brooks, W. H. Smith, Lords Frederick Cavendish, Sherbrooke and other celebrities. Architecturally the most interesting monument is that to Marie, Lady Dudley, a late Elizabethan tomb of gilded and painted alabaster with effigies. There is a celebrated epitaph by Pope and a less known one by Whittier. F. H. M.

Measuring Paintwork of Window.

Quæro writes: "How is the paintwork measured inside and outside respectively in the following cases:—(*a*) a double-hung window, top and bottom sash in one square only; (*b*) the same, but top and bottom sash in four squares each, or more or less, as the case may be?"

(*a*) This would be measured as No. 2 on sash-frames (one for each side) and No. 4 on squares (two for each side). If the sash-frames are over 24ft. super. describe as "large," and if over 36ft. super. as "extra large." If the squares are over 2ft. super. describe as "large." and if over 4ft. super. as "extra large." (*b*) The last description will apply to this. Casement windows would be measured in the same way. If the frames have mullions or transoms, describe them as in so many lights, *i.e.*, with one mullion and one transom would be in four lights; or, as an alternative, describe the frame as "with one mullion and one transom." In the case of bays it is well to take each side as a separate window, with an extra quantity (added to the superficial work) for the large angle mullions where they occur. The edges to opening casements are "numbered." W. E. D.

Boundary of Property: Adjoining Owners.

Worcester Park.—H. H. writes: "A purchases a plot of ground from B, who owns the land on each side. B, having to erect a fence (according to conditions of sale), has done so with the posts and rails on A's side. Is this right? I have always understood that the rule is to drive the nails home, which would mean taking the fence down and reversing it. If so, can A compel B to do this? B has also erected a house right up to the boundary of his site and opened windows in the flank wall overlooking A's ground. As A may possibly want to build up to his boundary, has he a right to block up B's windows?"

Firstly, with regard to the fence. You are quite correct in thinking that the supports of a fence should stand on its proprietor's own land, that the boundary line should be the face of the rails or boards, and that the nails should be driven home. Therefore, if B is bound by the contract to erect the fence on his own land, he has evidently not only misplaced it but has constructed it the wrong way round. Secondly, with regard to the house. According to your sketch and description B has encroached upon A's land not only in the points mentioned but also no doubt in the footings of his flank wall and the sills of his windows (if these latter project at all). Unless, therefore, all these points have been dealt with by clauses in the conveyance or "contract and conditions of sale," A has the right to call upon B to remove the fence and the overhanging portions of his building and himself to block up all the windows which open on to his plot, of course taking care that the obstructions are properly supported on his own land and not affixed to B's property. I presume from the sequence of events stated in the enquiry that B's house was not built when A bought his plot. A may, if he chooses, enter into a written agreement with B to pay a nominal rental for all these encroachments and for the rights of light, but it would be much more satisfactory in the long run if the properties were not so mingled, and I think B should agree to give A the few inches on the further side which he has abstracted from him on the near side and to brick up his windows at once. I advise A to write to B formally setting out all the points mentioned, and to express in general terms his willingness to settle the matter by friendly arrangement. Should B prove unreasonable A should at once consult his solicitor—for preference the gentleman who acted on his behalf when he purchased the land originally. G. S. M.

Bricks and Mortar.

Aphorism for the Week.

The Romanesque is a convert, a pagan turned monk. It was not born Catholic as the pointed arch was; it only became so by baptism conferred by the Church.—J. K. Huysmans.

Our Plates.

The proposed Seacroft Golf Links Hotel is to be a red-brick building up to the first-floor level, above which it will be rough cast, and with a "modelled" wood cornice, which will be painted white, the roof being covered with hand-made strawberry-coloured tiles. The accommodation provides not only the ordinary hotel accommodation, but also a small golf club, with the necessary dressing-rooms, &c. Messrs. Brewill & Baily, FF.R.I.B.A., of Nottingham, are the architects.—The house "Juniper Hill," now building, stands on the brow of the hill overlooking the Weald of Surrey, above Reigate Heath Surrey. It is of rough-cast, with a green Westmorland roof. The ornamental plasterwork outside and in is being done by Mr. George P. Bankart, of Bromsgrove. Messrs. Bushby & Son, of Reigate, are the builders, and the architect is Mr. E. Guy Dawber, of London.

The Walls of Avignon.

We are glad to hear that there is still some prospect of the preservation of the walls of Avignon. The French Government has made barracks of the Papal Palace, cutting out the pointed windows, for sanitary reasons, and, which perhaps is kind, covering those frescoes which survived the brutality of the soldiers—with whitewash. Then a political person, M. Pourquery de Boisserin, who had become *maire*, tried to curry favour with the ignorant of his electorate by demolishing the mediæval ramparts, among the most beautiful and best preserved of their period in existence. He attacked two of the gates, but, happily, he has now been defeated at the elections and is ousted from his office. They have in France a Ministry of Fine Arts which might have prevented this sort of thing.

German Art.

Prof. Reinhold Begas, the foremost living German sculptor and the Kaiser's favourite, whose resignation from the Royal Academy of Art was so unexpected, has confided to an interviewer that his reasons for so doing were not only those of advancing age and stress of private work. "I resigned because the people of the Academy want a plasterer and not an artist. I am too old to labour with beginners and infant classes, and have work of more importance to engage my time. I ought to hesitate in expressing my opinions regarding what is styled in certain circles 'modern German art,' for my opinions are not complimentary to certain people, and would no doubt give offence. Germany is acknowledged to stand first among musical nations of the world, but the less said of German art the better."

Discoveries in Crete.

The excavations begun towards the close of last season at Hagia Trias, near Phæstos, on the southern coast of Crete, by Professor Halbherr, have been resumed this spring under the direction of M. Hatzidakis, the ephor of antiquities at Candia. At this spot Professor Halbherr made the very interesting discovery of another Mycenæan palace similar to those at Knossos and Phæstos. The palace is conjectured to have been the maritime residence of the kings of Phæstos, for the sea, which is now about two kilometres from the site, has probably receded considerably since Homeric times. The recent excavations have revealed a large structure containing the usual hall for men, another hall for women, baths and store-rooms. No cisterns or water-pipes have yet come to light. Among the bronze objects recovered are several statuettes, votive effigies of oxen and goats, a spearhead, and ten double axes of the usual Cretan type, together with two small votive double axes. Nineteen talents of bronze, in the shape of rectangular plaques, have also been found; these apparently served as standard weights, or were employed in commercial transactions. A large amount of pottery has also been recovered. The excavations, which were suspended during the Easter holidays, will shortly be resumed.

Old Manchester Town Hall.

The Free Reference Library in King Street, Manchester, which, by the sale of the Piccadilly site, is to be demolished, is the old Manchester Town Hall. It was begun in 1822 and cost nearly £40,000. The designs were prepared by Mr. Francis Goodwin, a London architect. The style of architectur was said to have been "derived from th Temple of Erectheus at Athens, and th dome in the centre was modelled on th octagonal tower of Andronicus, generall called the 'Tower of the Winds.'" Originall there was a group of statuary over the fron of the building "emblematical of the tow of Manchester, with figures representin Commerce and Trade." This, however, ha long since been removed. The groun floor was used for the accommodation the police, and offices for the town beadle and comptroller. The large room on th second floor, 130ft. long by 38ft. wid which is now daily occupied by its hun dreds of readers, was in its original for quite an imposing chamber. Its fine pr portions, with the massive fluted pilla and the central dome, remain, but the schen of decoration is hidden by the great boo presses that line the walls. The decoratio of the hall was undertaken about 1830. the summer of that year a Mr. Aglio, artist of London, was introduced to a Ma chester gentleman, "a warm admirer of t fine arts." In the course of conversation t subject of fresco-painting was brought and "the propriety of adapting this elevat style of art for the embellishment of the pr cipal room of the Town Hall was suggest in preference to the common mode of hou painting." The authorities approved idea, and Mr. Aglio undertook the wo Manchester was incorporated in 1820. that year the present entrance hall and sta case were constructed, and alterations w made in the hall itself by which a coun chamber was provided. Until the old h was vacated, in 1877, for the new town h in Albert Square practically the whole the municipal business was conducted wit its walls.

A Council Discussion.

At last week's meeting of Blackpool Town Cou Councillor Hampson d attention to the new Technical School c petition, for which premiums of £100 been offered; but the conditions were that only twelve designs were submit and he moved that the matter be refe back. Alderman Grimer said that of twenty-six architects in the district only accepted the conditions. Alderman H stated that Councillor Hampson was w in his assertions. The Committee all a had desired to have an assessor to advise t upon the various designs. What the architects objected to was that the Comm of the Council should reserve to thems the right to decide which design shoul accepted. Alderman Mather remarked architects objected to enter for competi unless there was some assurance that successful competitor should carry ou work. Eventually the amendment withdrawn.

Construction Notes.

Rubble Masonry. THERE are a number of points which require attention in the employment of rubble masonry. Of course, rubble consisting of small or irregular pieces of stone does not produce such a homogeneous wall as ashlar, and precautions are therefore taken to overcome this as much as possible. Rubble walls are built of stones generally less than 9in. deep, of irregular shaped blocks in random rubble and squared blocks in coursed rubble. The most common defects in rubble masonry are (1) the stones are not brought to an even bearing; (2) large vertical openings are left between several stones; (3) a considerable height of wall is laid up dry, with only a little mortar on the face and back, mortar then being poured upon the top of the wall; (4) insufficient cement, or cement of poor quality. The vertical joints should be carefully filled with mortar. The actual bed of stones must be closely observed, just as much as in ashlar. Binders or through stones should be used in all courses and the angles constructed of cut or hammer-dressed stone. Long binders or bond stones should not be used in extra thick walls, as they are then liable to fracture, but headers should be used going through about two-thirds of the thickness, crossing each other alternately. Spalls have often to be used to keep stones level in course by raising corners, and unless the mason places the spalls so that the stone rests firmly—that is, does not rock—it will work loose, particularly if subject to shock. Footings of undressed rubble should not be built with lime-mortar, as it gives. They are better built dry or with cement-mortar. The stone used for rubble walling, or irregular and internal walling of any sort, is usually a local thinly-bedded one. Random rubble s often built dry in rough walls, *i e.*, without mortar, and should then be protected by a weatherproof coping of dressed stones, or of stones set on dge in mortar, or by tiles.

Decorative Tiling. TILES for decorative purposes, now largely used for lavatories, bathrooms, sculleries, theatres, hospitals, swimming baths, fireplaces, &c., are usually made from ⅜in. to ½in. thick, and in ll sizes, though the stock sizes are quares of 6in., 5in., 4½in., 4in., 3in., in., 1½in. and 1in. Longitudinal and iagonal half-tiles are almost always made in every kind except hand-ainted varieties. The tiles should ave good keyed backs. Before fixing, ll old plaster should be entirely removed. The tiles should be bedded n neat Portland cement on a backing onsisting of Portland cement and and (1 and 1) laid on in the same anner as an ordinary rough coat of aster. The pointing is usually done Parian cement (though Portland is ften used) tinted to the colour of the les, care being taken to wipe off any ment on the face of the tile. Too uch stress has been laid upon fine ints in tilework, but there is no ecial disadvantage in a ½in. joint as gainst an ⅛th or ¼in. joint, and a ide joint often secures a most pleasing fect, not endeavouring to appear an bsolutely plane homogeneous surface, hich tiles, by their nature, can never ve. For resisting heat in stoves special tiles are made of a clay of loose physical texture, which allows of expansion by sudden heating.

H. K. D.

The Campanile of Westminster Roman Catholic Cathedral, a reproduction of which we are able to publish through the courtesy of "The Sphere," is 284ft. high and 30ft. square. The cross on the top is 10ft. high.

THE CAMPANILE OF WESTMINSTER ROMAN CATHOLIC CATHEDRAL.

FALLACIOUS CEMENT TESTS.

AT the last meeting of the Society of Engineers a paper was read on "Certain Vexatious and Fallacious Cement Tests now in Vogue" by Mr. D. B. Butler, vice-president.

Want of uniformity in the method of carrying out the most ordinary tests was first referred to as a cause of frequent vexation and friction. The simple matter of fineness was often in dispute owing to the different thickness of wire employed in the sieves used for testing. In England there was no agreement on this point, but in America and on the Continent the uniform standard adopted was that the thickness of the wire should be one-half the width of the opening. Examples were given of the varying results obtained with different thicknesses of wire, and the author stated that in order to bring his practice into line with the majority of the cement-using community he had abandoned the Faija standard and adopted the American and Continental standard.

The most glaring example of a vexatious and fallacious test was the "marmalade pot" test for free lime or unsoundness, in which it was assumed that the evolution of heat during setting denoted the presence of free lime. A quotation from a recent paper by the author, published by the Institution of Civil Engineers in 1898, showed the fallacy of this test. As, however, it was still being enforced in many cases, causing an immense amount of unnecessary friction between the engineer and the manufacturer, and in some instances no little expense to the latter, further examples of its misleading character were given from the author's daily practice. The results conclusively demonstrated that the rise of temperature was entirely due to the heat evolved by the crystallizing action of setting, and that therefore a slow-setting cement evolved little or no heat, while a quick-setting cement might show a rise of 20 or 30 degs. and yet withstand every known test for soundness. The results further demonstrated that not only did the evolution of heat during setting not indicate free lime or unsoundness, but, what was more to the point, the evolution of no heat was no guarantee of soundness, several samples which evolved no heat being utterly unsound and absolutely worthless. Nor could it be asserted that because a cement showed a rise of temperature of 15 or 20 degs. that it was therefore too quick-setting for general use. Many cements did not commence to set, and therefore evolved no heat, for about 15 or 20 minutes from the time of adding water (which was slow-setting enough for most classes of work), and then proceeded to set and crystallize rapidly, sometimes causing a rise of 20 degs. in less than as many minutes. The author therefore strongly urged that the temperature test should be discarded as a vexatious and fallacious test.

While recognizing the fact that special kinds of work necessitated special kinds of cement, the following standard specification was put forward as ensuring a good sound cement suitable for most classes of work, and obtainable from any first-class manufacturer.

The whole of the cement shall be

pure Portland cement, and shall conform to the following tests:—

Fineness of Grinding.—To be such that, when sifted through a standard sieve having 50 holes per lineal inch, there shall not be more than one-half (½ per cent.) by weight of residue; when sifted through a sieve having 76 holes per lineal inch, there shall not be more than five (5 per cent.) of residue; and when sifted through a sieve having 100 holes per lineal inch, there shall not be more than twelve (12 per cent.) of residue.

Time of Set.—A pat of neat cement gauged with the minimum of water at the normal temperature (60 degs. Fahr.), and placed on a glass or other non-porous slab, shall not commence to set in less than eight minutes, or take longer than five hours to set hard.

Soundness, or Freedom from Expansion and Contraction.—A pat submitted to moist heat and warm water in the Faija apparatus for soundness at the usual temperatures, viz., 110 degs. Fahr. and 120 degs. Fahr. respectively, shall show no cracks or signs of expansion after 24 hours.

Tensile Strength. — Briquettes of neat cement, gauged with the minimum of water on a non-porous bed and placed in water 24 hours after gauging, shall carry an average tensile strain of not less than 350lb. per sq. in. after three days, 450lb. after seven days, and 550lb. after twenty-eight days from the time of gauging.

Briquettes composed of 3 parts of standard sand to 1 part of cement, by weight, shall carry an average tensile strain of not less than 150lb. per sq. in. at seven days, and 250lb. at twenty-eight days, from the time of gauging; but, whatever strength may be developed at the earlier dates, both neat and sand briquettes must develop an increase of at least 50lb. between each date.

MODERN LONDON BUILDINGS.

(Continued from p. 168, *No.* 429.)

A list of public and semi-public buildings in the E.C. district was published in our issue for March 25th, of domestic and religious buildings, colleges and schools in the same district in the issue for April 1st, and of business premises in the same district in the issues for April 15th and April 29th.

E.C. DISTRICT: BUSINESS PREMISES—*cont.*

BUILDING.	ARCHITECT.	APPROXIMATE COST.	REMARKS.
1898—*cont.*		£	
Office Premises, 29, Great St. Helen's.	T. H. Smith	—	This building contains about 100 offices, approached from Great St. Helen's and St. Mary Axe. The area covered comprises about 7,000ft.
Offices Premises, 30, 31 and 32, Coleman Street and 1, Mason's Avenue.	Gardner & Theobald	—	
Premises for Mr. Charles Taylor, 22 Warwick Lane.	Walter Stair	6,000	The building has a total area of 3,000 sq. ft.
Premises for Messrs. Edward Barnard & Sons, corner of West Harding Street, Fetter Lane.	H. H. Collins	—	
Premises for Messrs. Raphael Tuck & Sons, Moorfields.	W. H. Nash	—	The building is known as "Raphael House," and has full frontages to Moorfields, White Street and Tenter Street.
Warehouse for Weiler Brothers, Golden Lane.	George Vickery	—	The building fronts towards four streets, and stands upon an area of half an acre. It consists of basement and five floors over, with flat asphalted roofs. On the top floor are kitchens for the use of 300 employees.
1899.			
Hamilton House Building for the Employers' Liability Assurance Corporation, Thames Embankment.	Sir W. Emerson	—	The building faces the Embankment and has three frontages architecturally treated, all in Portland stone. The public office is on the ground floor, south side; in the basement is a hall for company meetings, and in the sub-basement a number of strong-rooms. On the upper floors are suites of offices, all of fireproof construction.
London & Westminster Banking Co., Ltd, Branch Bank, corner of City Road and Old Street.	R. Bennett	—	The style of the building is Italian. It is constructed up to the first-floor cornice in red and grey Aberdeen granite and the upper part in red brick, with Portland-stone piers, caps and dressings. The basement contains the strong-rooms, built in blue brickwork and steel banded. The banking-room on the ground floor has the walls lined with solid Devon marble, the skirtings, sills and mouldings being in black Ashburton marble. The twelve piers have alabaster bases and caps, with the enriched ceiling in fibrous plaster. The stone carving is by Mr. Seale, of Camberwell.
North Metropolitan Tramways Co.'s Offices, 60 and 62, Finsbury Pavement.	Davis & Emanuel	—	The basement, ground, first and second floors are devoted to rooms for counting and checking the tickets, advertising office, paying-in office for the conductors, general clerks' office, waiting-rooms, and a large room 38ft. by 20ft. for meetings of the Company's shareholders. The third and fourth floors are used for residential purposes. The elevation is of buff terra-cotta and white Portland stone.
Offices Premises, 15, Devonshire Square.	T. Chatfeild Clarke	—	The building contains private rooms and offices for a firm of solicitors, with a caretaker's residence on the top floor. The wood finishings internally are varnished pitch-pine. Externally, red bricks and Monk's Park stone were used. At the rear of the ground floor is a strong-room.
Office premises, 77 and 78, Gracechurch Street.	T. Chatfeild Clarke	—	This building occupies an important frontage to Gracechurch Street, with return frontage to Ship Tavern Passage, and consists of suites of offices. The building is fireproof throughout, including the roof, which is covered with copper. The front is of Portland stone, the sculpture and carving being carried out by Mr. M. Lawlor.
Prudential Assurance Company, Holborn (additional block of offices).	Alfred Waterhouse	—	The additions consist of a scheme for covering the whole of the parallelogram bounded by Brocke Street, Greville Street and Leather Lane, which has towards Holborn a frontage of 310ft. and which occupies an area of 12,244 sq. yds. The archway, under the tower, leading to a centre court, is groined with terra-cotta. and provides at a future date for the main entrance to the Prudential Offices. Red Peterhead granite, red terra-cotta and red brick are the materials of which outwardly the offices are mainly composed. The inner walls are, in the principal public offices, lined with faïence, and in the secondary, with glazed bricks of various tints.
Premises, corner of Bread Street and Cannon Street.	H. Huntly-Gordon	—	The front elevation of the building nearly faces the Mansion House Railway Station, and above the basement and ground floors there are five floors. There are sixty rooms contained on the various floors, while in the basement are specially constructed strong-rooms. The building is constructed of red brick and Portland stone, standing on a plinth of Labrador granite. The staircases are of marble and faïence.
Premises, 19, 21 & 23, Jewin Crescent.	Benjamin Tabberer	—	All the floors and roofs are constructed of iron and concrete. The stairs are built of artificial stone, and the staircases are enclosed by 9in. partitions of white-glazed brickwork. The walls behind the back areas are hung with white enamelled tiles. Where wood is indispensable, as for doors, shop-fronts and window frames, teak was used. In the front elevation the principal piers on the ground and first floors are faced with Farnley glazed bricks, the lower portion being brown and the upper a blue-grey. The rest of the front is constructed of Imperial stone and red Fletton bricks.
1900.			
Lloyd's Registry, Fenchurch Street.	T. E. Collcutt	—	The building is erected in Fenchurch Street, with a frontage to Lloyd's Avenue of 144ft. The accommodation provided includes general offices for the secretary and his staff, surveyors', engineers' and draughtsmen's rooms, committee-room, board-room and luncheon-room. There is also a library and a museum. The whole of the frontages are of Portland stone, and the staircase and entrance are lined with Devonshire marble.
National Telephone Head Offices, Victoria Embankment.	A. N Bromley	—	The building is faced with Portland stone throughout, and the figure subjects, which have been executed by Mr. Gilbert Seale, are designed to illustrate the uses of the telephone. The roofs are of high pitch in order to obtain as much space as possible.
Salisbury House, Finsbury Circus.	Davis & Emanuel	250,000	This building has a frontage to Finsbury Circus of about 300ft., to London Wall of about 300ft., to Circus Place of 100ft., and to West Street a frontage of 70ft. The London Wall frontage is devoted to shops, and the building contains about 800 offices, has seventy strong-rooms, and comprises two basements, upper and lower ground floor, and seven floors over, housekeeper's apartments being provided on the top floor. The entire building is faced with stone, the design being French Renaissance in character. The offices are arranged in suites of from one room up to twenty or thirty.
1901.			
Bank Buildings, Prince's Street.	Arthur C. Blomfield	—	This large block of commercial buildings is for the Governor and Company of the Bank of England. It is situated at the corner of Prince's Street, and overlooking Lothbury.
Eastern Telegraph Company's Building, Finsbury Pavement.	John Belcher	—	In this design the idea has been to symbolise, as much as possible, the work and scope of the companies that are to occupy the building, hence the frequent introduction of spheres and globes and other geographical and electrical insignia. The same idea is suggested for the hall, where the frieze represents the work of the telegraph companies in different parts of the globe. The emblems of the different companies are produced in the lead-work of the dome, which is surmounted by an armillary globe supported by appropriate figures. The ground-floor storey of the building is in granite, and the whole of the superstructure in Portland stone.
Premises for Messrs. Booth & Co., Ltd., 55, Cowcross Street.	E. W. Mountford	—	The lower part of the front building is faced with grey unpolished Dartmoor granite. Above that red bricks are used with Monk's Park stone. The carved frieze beneath the main cornice is of Portland stone. The slating is o green Westmoreland slates

E.C. DISTRICT: BUSINESS PREMISES—*cont.*

BUILDING.	ARCHITECT.	APPROXIMATE COST.	REMARKS.
1902.		£	
"Birmingham Daily Post" Offices, 88 Fleet Street.	John Belcher	—	This building is of Portland stone and Cornish grey granite, the style being rather a severe classic.
"Christian Herald" Warehouse and Publishing Premises, 6, Tudor Street.	Banister Fletcher & Sons	—	The building is of fireproof construction, and the front of red brick, the ground floor of Portland stone and the roofs covered with green Westmoreland slates.
Express Dairy Company's Depôt, 54, Ludgate Hill.	Young & Hall	—	The building has a frontage of 17ft. 6in. and a depth of about 67ft. The basement contains a smoking-room the entire length of the building, with a scullery and boiler-house behind. The ground and first floors are luncheon- and tea-rooms; the second floor, private rooms; and the third contains the kitchen, with scullery and store-rooms attached. The building is faced with Doulting stone.
Office Premises, 4, Coleman Street.	Ernest Flint	—	The building was erected on the site of a city merchant's house, which contained some cedar panelling and chimney-pieces—these have been preserved in the new building, which is of fireproof construction and is faced with Portland stone.
Offices for Mr. H. C. Stephens, 57, Aldersgate Street.	G. L. Crickmay	—	The Aldersgate Street front is built of granite on the ground floor, with thin red Ruabon bricks and Portland stone for the upper floors. The roofs are covered with green Westmoreland slates, and the back portion is of white-glazed bricks and Portland stone. The rooms and staircases have Belgian antique marble dados, and the fittings are of teak and mahogany.
Premises of the "Sheffield Telegraph," corner of Fleet Street and Fetter Lane.	Gibbs & Flockton	—	The building is Free Renaissance in style, faced with creamy-white Carrara faïence. There are nine shops, with a façade of 131ft. to Fetter Lane and a narrow 20ft. return front to Fleet Street. The block is four storeys in height, in addition to basement and attic floors. The ground and first floors contain the offices for the "Sheffield Daily Telegraph," with a frontage to Fleet Street and an entrance and two shops to Fetter Lane. The construction is fireproof, the floors being of steel girders and concrete supported on cast-iron standards.
Shop Premises for Messrs. Gamage, Ltd., 125-9, Holborn, and 1-8, Leather Lane.	Joseph Sawyer	55,000	The building has a frontage of 66ft. to Holborn and of 290ft. to Leather Lane. It is six floors in height, including the basement, and is divided into five sections, with intercommunication by means of wrought-iron party-wall doors. The interior is lighted by means of open wells, surmounted by glazed cupolas. The Holborn front is entirely of Portland stone, and that towards Leather Lane is of Portland stone and white Suffolk facing bricks. At fourth-floor level are sculptured figures representing various sports. Kitchen and dining-room accommodation is provided on the top floor for the entire staff which numbers about 250.
1903.			
Baltic Mercantile and Shipping Exchange, Jeffreys Square.	T. Smith and W. Wimble.	—	The exchange and offices occupy the whole of the ground floor of the building. The principal entrance is in St. Mary Axe, and consists of an outer arcaded vestibule, 32ft. by 16ft. and an inner hall 40ft. long by 24ft. wide, on either side of which are the secretarial offices and board-room. The Exchange is 152ft. long by 94ft. wide by 30ft. high, with a central dome 30ft. in diameter. The members' cloak-rooms and lavatories are in the basement. At the end of the Exchange is an apse from which there is access to postal and telegraph offices and members' reading-rooms. There are also luncheon- and smoking-rooms and kitchens in the basement. Above the Exchange are four floors of offices, containing about 200 rooms. Externally the front to St. Mary Axe is of polished granite up to first-floor level and above this in Portland stone with polished granite columns.

E.C. DISTRICT: HOTELS, RESTAURANTS, &c.

1876.			
"Baynard's Castle Tavern," 148, Queen Victoria Street.	Major J. F. Wieland.	—	The style of the building is an adaptation of the Tudor. It is carried out in red brick and terra-cotta.
1877.			
Holborn Viaduct Terminus Hotel.	L. H. Isaacs - -	120,000	The hotel has a frontage of 235ft. and a depth of 70ft. There are 170 bedrooms and twenty-two reception-rooms, in addition to coffee- and billiard-rooms. There is a detached block which cost £30.000. The style adopted was Italian, with a great deal of French feeling in the windows, dormers, Mansard roof, &c. The carving was executed by Thomas Bromfield.
Tavern for Chapman Bros., and Houses at corner of Cannon Street and Queen Victoria Street.	Taylor & Locke -	—	These buildings are immediately opposite the Mansion House, and have frontages to Cannon Street and Bow Lane of 112ft. and 50ft respectively. The tavern is situated at the corner of the site. The external walls are of Tisbury stone, with polished Shap granite pilasters.
"The Bull" Tavern, Devonshire Street.	W. L. R. Payne -	—	The ground-floor is of Portland stone, the superstructure being of red brickwork, with a balustrade in terra-cotta.
"The King's Head" Tavern, Fenchurch Street, (rebuilding).	F. & H. Francis -	—	
1878.			
"Three Nuns" Hotel, Aldgate.	Jarring & Wilkinson.	10,000	
1879.			
Anderton's Hotel, Fleet Street.	Ford & Hesketh -	40,000	The building is of red brickwork with Portland-stone dressings, and is very elaborately carved. The elevation is 78ft. high. On the ground-floor are two large shops, above which are five floors, comprising the hotel proper. The hotel is approached by an arched entrance of polished granite leading into a corridor 67ft. long by 10ft. wide by 14ft. high. The crypt in the basement is 51ft. by 37ft. by 20ft. high. The depth of the building is 72ft.
Manchester Hotel, 136, Aldersgate Street.	Bateman & Corser	40,000	The building is Gothic in design, built of red brickwork, with stone dressings. The ground floor contains shops fronting on Aldersgate Street and Long Lane. The coffee-room is 50ft by 32ft. and the smoking-room 60ft. by 24ft.
"Old Rodney's Head" Tavern and adjoining warehouse, 14, Old Street, St. Luke's.	Rowland Plumbe -	—	The tavern has a frontage of 3 ,ft. and a depth of 60ft. The buildings are of red brick, with stone dressings.
1880.			
Jerusalem Coffee House, Cowper's Court, Cornhill (rebuilding).	Bassett & Keeling	—	There is a spacious hall on the ground floor. The front elevation is of red brickwork with brown Portland-stone dressings, and the back elevation of white-glazed brickwork.
1881.			
"The Golden Axe" Tavern, St. Mary Axe (rebuilding).	H. H. Collins -	—	
Auction Mart Restaurant, Tokenhouse Yard (additions).	Bassett & Keeling	15,000	The decoration of the restaurant is Renaissance in character.
1884.			
'The Old Yorkshire" Tavern, Philip Lane, London Wall.	J. T. Smith - -	8,000	The building is faced with red bricks, with alternate bands of red Mansfield stone.
"The Salutation and Cat" Tavern, Rose Street, Paternoster Square (rebuilding).	Wylson & Long -	16,000	The facings to the building are of red brick and the dressings of terra-cotta.
1885.			
"The Kings and Keys" Tavern, 142, Fleet Street	Hooker & Hennings	—	Piers on the ground floor, of grey granite, support a projecting bay of Portland stone above. The carving was executed by Mr. Frampton.
"The Jamaica" Tavern, St. Michael's Alley, Cornhill.	Banister Fletcher -	—	The style is a free adoption of Renaissance, carried out in red brick with red Mansfield stone dressings.
1886.			
"The Green Dragon" Tavern, 56, Fleet Street.	Freud & Keogh -	—	The building is 72ft. high and comprises six floors. The ground floor is faced with red Aberdeen granite, with polished pilasters and columns. The upper portions are of Corsehill and Portland stones, and there is a balcony at first-floor level.
1888.			
"Old Chapter" Coffee-House, 49, Paternoster Row.	Taylor & Locke -	—	The building has frontages to Paternoster Row and Paul's Alley of 50ft. and 49ft. respectively. The façade is 58ft. high to the ridge. The ground-floor storey is in richly-carved Doulting stone, surmounted by a cornice. The upper portion is in red brickwork, with Doulting-stone dressings.
1901.			
Throgmorton Restaurant, Throgmorton Street.	Charles Reilly -	—	This restaurant is constructed entirely below the level of the street. Entering through a spacious lobby, a marble staircase, lined with gold mosaic, leads to a large restaurant adorned with oak panelling, marbles, a decorative frieze and ceiling, and paved with mosaic, about 50ft. by 40ft. and 15ft. high. A grille of variegated onyx is placed at the end of the restaurant, with a rich background of Devonshire marble. Beyond this is the dining-room, 260ft. long by about 16ft. wide. The walls are lined with marble, with coupled pilasters of verde antique, with bronze Ionic capitals and frieze and rich red marble dado. The saloon between the restaurant and dining-room is intended for private dinners. Going down again is a large room, decorated with Devonshire marble, bronze capitals and friezes, which is intended as the grill-room, and is 40ft. below ground-level. The kitchen arrangements are fitted with the most modern appliances

(To be continued.)

Keystones.

A New Police Station at Moor Lane, E.C. is being erected.

A new Church at Old Basford is being erected at Dob Park, Arnold Road. The architects are Messrs. R. Evans & Son.

A New Bank at Blackhill, near Consett, has been erected for the York City and County Banking Company. Mr. G. T. Wilson, Blackhill, was the architect.

Mr. E. J. Physick, sculptor, has been commissioned to execute the memorial of the late Dr. Parker for erection in the City Temple.

Northern Architectural Association.—The annual report gives the present membership as 203, and the accounts show a balance to the good of £74 18s. 4d.

French Excavations at Delphi. — The museum at Delphi, where the important antiquities brought to light during the excavations made there by the French Government have been deposited, has been inaugurated and handed over to the Greek Government.

The Competition for Baptist Church and Schools at Wavertree, Liverpool, has been decided in favour of designs submitted under motto "New Era," the authors being Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, London, W.C. The assessor was Mr. Henry Hartley, F.R.I.B.A., F.S.I.

Signor Luca Beltrami, who has been entrusted with the reconstruction of St. Mark's Campanile, is one of the most distinguished architects and art critics in Italy. As an authority on Italian Mediæval and Renaissance architecture he is almost without a rival. Under his direction the Sansovino loggia is to be rebuilt, as well as the campanile.

Competition Reform Society.—The Committee disapproves of the existing conditions in the competition for artizans' dwellings at High Wincobank, Sheffield, but is endeavouring to get them revised. Meanwhile members are requested to abstain from competing. The reasons of complaint are—excessive amount of work required; no undertaking that author of premiated design will be entrusted with the carrying out of the work; no mention of commission proposed to be paid, &c.

A Piccadilly Colonnade.—The Improvements Committee of the London County Council suggest the widening of Piccadilly between Arlington Street and the Green Park, now that the Walsingham House and the Bath Hotels are being rebuilt. The owners of the property have agreed to surrender, at a price much below the market value, the land necessary to secure a width of 85ft. for this part of the thoroughfare, provided the following conditions are accepted:—(1) The owners to have the right to build over the new footway upon the first-floor level and above up to the height of the present buildings, the new buildings being supported by a colonnade; (2) the line of piers of the colonnade to be built on a give-and-take line; and (3) the Council to take the necessary steps to obtain possession of the portions of the premises at present occupied by lessees. The gross cost to the Council of the property needed for the improvement will be about £43,000, or, deducting £2,000 to be contributed by the company, £41,000. The cost of the paving works is estimated at £2,000. The Committee believe that the method of securing the additional width by the formation of a colonnade will introduce a very pleasing architectural feature in that part of London.

The Aberdeen Municipal Buildings are to be extended and altered at an estimated cost of £10,000 from plans by the city architect.

His Excellency the Lord Lieutenant was present at the recent conversazione of the Royal Institute of Architects of Ireland, held in the buildings of the Royal Hibernian Academy of Arts.

Sutton Coldfield Town Hall Competition.—Messrs. Mayston & Eddison, of 7, Great James Street, Bedford Row, London, have been placed first. The second and third places have been allotted to Mr. Herbert A. Hall, of the Old Park, Southgate, London, and Mr. W. F. Edwards, Colmore Chambers, Newhall Street, Birmingham. There were forty competitors, and the prizes offered were £50, £30 and £20.

A Manchester Competition.—The assessor in the competition for the proposed new Manchester and Salford Hospital for skin diseases, Mr. Keith D. Young, has made his award as follows:—1st premium, No. 15, Messrs. Thomas Worthington & Son, Crown Street; 2nd premium, No. 11, Messrs. C. K. & T. C. Mayor, John Dalton Street; 3rd premium, No. 9, Messrs. Mee & Hooley, Victoria Street, Manchester.

Liverpool Cathedral Competition.—The five firms of architects who were invited by the Committee to send in final designs for the proposed cathedral on St. James's Mount, Liverpool, have all fulfilled the requirements. The drawings have been hung in the Walker Art Gallery for the convenience of the advisory architects, Messrs. G. F. Bodley, R.A., and Norman Shaw, R.A., who began their task at the commencement of last week.

Dundee Architects and Registration.—At a meeting of the architects of Dundee and district held last week a resolution was unanimously passed in favour of the registration of architects and the promotion of a Bill in Parliament for that purpose. Among the speakers were Mr. A. A. Symon, Arbroath, president of the Dundee Institute of Architecture, and Messrs. Blackadder, C. Owen, Leslie Owen, Murray, Shepherd and Thomas, Dundee, and Gavin, Arbroath.

Irish Marble for Marlborough House.—The Prince and Princess of Wales, who recently visited the collections of Irish marbles and building stones exhibited by the Department of Agriculture and Technical Instruction for Ireland at the Imperial Institute, London, have just shown their interest in this collection by ordering some columns of Irish marble for the decoration of Marlborough House. The marbles ordered are Connemara or Irish Green, Galway Black, Irish Grey (Cork), Sunset (Midleton), and Clonowen Fossil.

Grinling Gibbons Carving.—Some choir panelling, a screen and an altar rail by Grinling Gibbons, formerly in the chapel of Winchester College, are on exhibition in the skating rink at the Cheltenham Winter Garden till Friday, May 15th. *In situ* the screen and panelling occupied a space of about 65ft. by 33ft. About 1840 they were removed by Butterfield, presumably to give place to Gothic work, and soon after this the College authorities appear to have sold the work to a nobleman, in whose possession it remained until comparatively recently. The present owners are a London firm, and the work has been temporarily in Cheltenham as the result of a commission to Messrs. H. H. Martyn & Co. to clean and restore it. In the way of actual "restoration" there is very little: the oak is in excellent preservation, and, except for damage incidental to removal from its original position, practically no renovation was required. We understand that in all probability the work will go to South Kensington Museum.

The Temple Church.—In reply to enquiries made recently in regard to the condition of the Temple Church, Sir Henry Lawrence, sub-treasurer of the Inner Temple, stated that the building had been examined by a competent architect and the matter was under consideration of the Benchers of the two Inns. The carving and decorations of the porch were considerably decayed, and would, sooner or later, have to be renewed. It was a question whether this would have to be done now or ten years hence. There was, however, no structural damage, and nothing to imperil the safety of the building. All the decayed work only dated back about sixty years, when there was considerable restoration of the church and unsuitable stone was used.

R.I.B.A.

President's Second "At Home."

ON Monday evening at 9, Conduit Street, W., Mr. Aston Webb held the second of his successful "At Homes" as president of the Royal Institute of British Architects. The rooms were again filled to overflowing and the buzz of voices no whit the less. It will be remembered that a splendid collection of drawings of the late J. F. Bentley's work was exhibited at the first of Mr. Webb's "At Homes": on this second occasion the late W. Eden Nesfield was represented by a similar collection, including Kinmel Park, Abergele (a mansion as large as Hampton Court—1865), Cloverley Hall, Shropshire (1865), Loughton Hall, new wing to Combe Abbey, Warwickshire, for the Earl Craven (1861), bank at Saffron Walden (1863), Lea Wood, near Matlock (1874), the church of St. Mary, Farnham Royal (1874), Radwinter Church.

William Eden Nesfield was born on April 2nd, 1835. His father, Major Nesfield, was a well-known member of the old Society of Painters in Water Colours, and became famous in his day for designing and laying-out gardens, terraces and parks: to him we owe the gardens in Regent's and St. James's Parks, the remodelling of those at Kew, and at many country seats. His son was educated at Eton, and afterwards went for a few months to Mr. J. K. Colling "to learn to draw," and then to the late Mr. Burn, where Mr. Norman Shaw was also a pupil at the time: indeed, these two names run counter—as the late Mr. Brydon has said, all during the 'sixties their names were so linked together, their published sketches from the Continent so similar in character, the conjunction of Nesfield & Shaw so familiar in the artistic world, that it hardly ever occurred to think of them separately, and yet, in spite of a brief partnership in the earlier days of their practice, they never really did a joint work. They shared offices and studies, had the same high aims and aspirations, the same keen artistic instincts; good comrades both, but each devoting himself to his own special work; advancing along separate yet parallel lines in all that made for the culture and ennobling of the art they mutually loved and whose highest interests they did so much to promote. Nothing was more characteristic of Mr. Nesfield than his cottages and lodges. Those in Regent's Park (1864) and Kew Gardens (1866) are landmarks in the history of such buildings. He was a master of planning and construction, as one may see in such buildings as Cloverley and Kinmel, he had a keen eye for the picturesque, he never lost sight of the dignity of his work, and no detail was too small for his best attention. He died in 1888.——The following have been nominated for the Council of the Royal Institute of British Architects for the next session:—Messrs. R. Farrow, W. Milner Fawcett, Ernest George, J. W. Simp- C. H. Heathcote, S. Perkins Pick, S. B. Russell and Silvanus Trevail.

THE EFFECT OF DESIGN ON CONSTRUCTION.

From a Contractor's Point of View.

By R. W. NEWMAN, A.M.I.C.E.

(Concluded from p. 178 of No. 430).

IN Fig. 10 will be seen the sectional plan of a brick-faced concrete wall in which the heading courses have been dispensed with, and instead a vertical bond has been formed by the brickwork. This method has many points to recommend it, the chief being that owing to the height to which the brickwork may be built not being limited by heading courses, but only by the height at which the brick-facing will support the green concrete, the various levels may be made to suit the position of the temporary strutting.

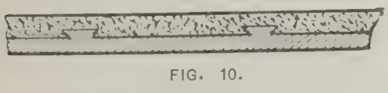

FIG. 10.

The usual method of constructing brick-faced concrete walls is to build the brick-facing to a certain height, and then fill in the concrete behind. It will, however, be found difficult to build battering walls in this way, as, if there is much batter on the wall, it will be impossible to carry the brick-facing to any height, as every course built tends to place the centre of gravity of the facing outside the base and the newly-laid brickwork tends to fall over backwards. This refers very much the same to curved walls, except that it will almost invariably be found that the latter-mentioned conditions apply in so marked a degree that to build the curved brickwork before the concrete is put in is almost an impossibility.

An alternative method is to put the concrete in first against wooden shutters, which are withdrawn before the brick-facing is built, but the height of the shuttering would be limited to the distance between the heading courses. It is difficult, however, to set the shutters to give a fine and regular joint between the brick and concrete, and it will generally be found that either the concrete has to chipped or that a large joint is left between the brick and concrete which has to be filled up with mortar. A 9in. brick-facing to concrete work is preferable to one of 4½in. It allows the work to be proceeded with more rapidly, as the facing, being thicker, is better able to withstand the weight off the green concrete than would be the case with 4½in. work.

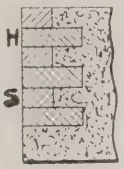

FIG. 11.

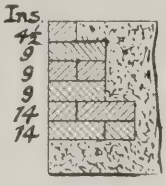

FIG. 12.

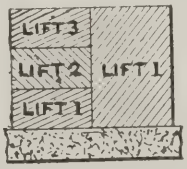

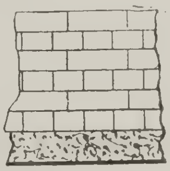

In Fig. 11 a wall with a concrete backing is illustrated, having a brick-facing of alternate headers **H** and stretchers **S**. Some engineers will specify that such a wall must be levelled up with concrete under each heading course, or every 6in. This causes a number of horizontal joints in the wall and increases the cost of the concrete, because it only allows comparatively small quantities to be put in at one time.

In Fig. 12 is shown a similar wall in which the concrete can be put in in 18in. lifts, and yet the bond of the brickwork appears the same on the exposed face. It may sometimes be to a contractor's advantage, with the consent of the engineer, to build the work as shown in Fig. 12 and accept payment for work as in Fig. 11, recouping himself for the additional brickwork by the saving in labour through being able to put in treble the quantity of concrete and brickwork at the same time. It must, however, not be taken from this that it would always be safe to adopt this alternative, as much depends on the relative prices of the brick and concrete work and the quantities involved.

How this saving may be effected will be best appreciated from an example. Suppose the brickwork took two hours to build in a 6in. lift; it would probable take four hours in the 18in. lift. Now the cost of erecting the scaffold is the same in each case, say one hour; this hour is saved twice over in the 18in. lift, added to which is saved the difference in the cost of getting ready the concrete stage three times instead of once, and also the cost of putting in the barrow runs, and the thousand-and-one incidental expenses which will occur to one familiar with such operations.

While on the question of retaining walls it may be appropriate to call attention to the method of proportioning plinths in parapets (Fig. 13). A panel is shown with a 2¼in. break, which necessitates cutting bricks at considerable expense and waste to carry out the design; had the breaks been 4½in. or multiples of that dimension no cutting would have been necessary (as shown by section C D).

The design of chimneys does not fall to the lot of every engineer, and I refer to this branch of construction to illustrate two points of interest only. In designing a hexagonal chimney the draughtsman in many cases extends the hexagonal section to the concrete foundation on which the footings of the chimney stand. Fig. 14 shows such a foundation and footings, and also the line to which the contractor will get out his excavation. Had the designer adopted the line which the contractor must follow in getting out his ground work, he would have saved the shuttering to the concrete, and would have distributed the weight over a larger area at little or no extra cost.

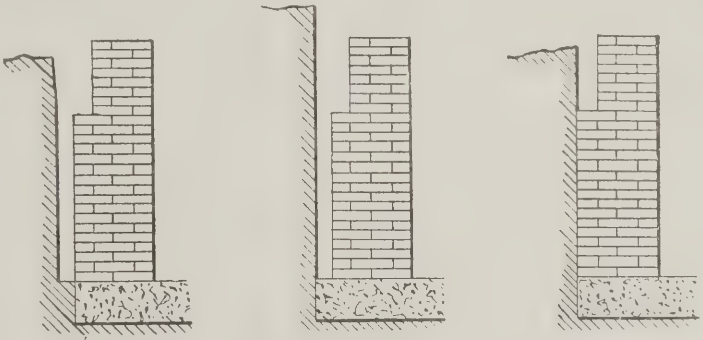

FIG. 15.—BUILDING BRICKWORK IN EXCAVATION.

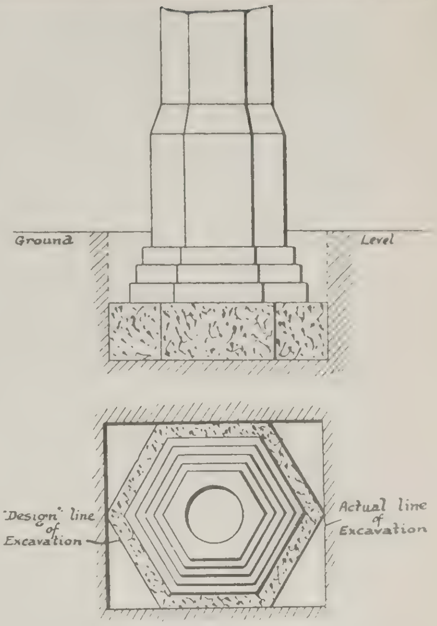

FIG. 14.

I have seen in some specifications a clause somewhat as follows: "For the purpose of keeping the angles in true line, the contractor shall as far as possible keep the same workmen on each angle from top to bottom of the shaft." It is a well-known fact that no two bricklayers lay their bricks alike. Give two men piers to build, say 3ft. high, with the same number of bricks, all gauged as to thickness, the result will probably be, if they are not allowed to measure the work as it proceeds, that one man will build his pier 2ft. 11in. high and the other man will make his 3ft. 1in. Applying this to the case of the chimney shaft above mentioned, it will be found that the joints are not horizontal, except where the courses have been levelled up; but if, instead, the men follow each other round the chimney, taking a fresh angle each day, this personal factor

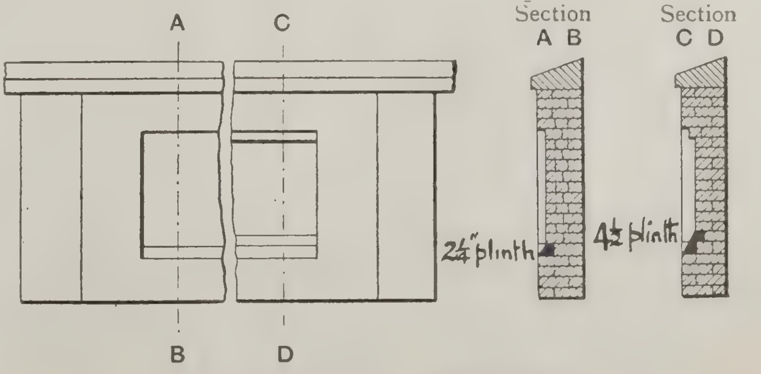

FIG. 13.—PLINTHS IN PARAPET WORK.

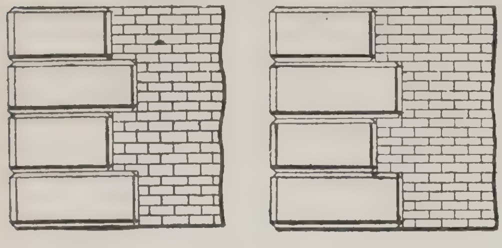

FIG. 16

3in. Bricks—Bad Result.
5 courses of brick = 16¼in.
6 " " 19½in.

2¾in. Bricks—Good Result.
6 courses of brick = 18in,
i.e., the depth of the stone.

will be largely eliminated and the courses of the chimney will be level.

In building brickwork in excavations it is not always possible to get out the ground to the dimensions given on the drawings. Allowance has sometimes to be made for timber to support the ground, and occasionally additional ground has to be removed to provide space for the men to work in. This may or may not be provided for in the design. Fig 15 shows such a case. Suppose the excavation is got out to the precise dimension of the outside of the brickwork, the probability is that some of the ground (especially in the rock) will project and that the bricklayers will have to wait while this is being removed, during which the earth may fall on and perhaps spoil what was previously well-finished work. Apart, however, from this consideration, when a bricklayer lays a brick he gets his fingers over the end, and wants room to do this, so that at least 3in. should be excavated beyond that shown for brickwork on the drawing. Neglect of a small precaution of this kind will materially affect the number of bricks a man will lay in a day.

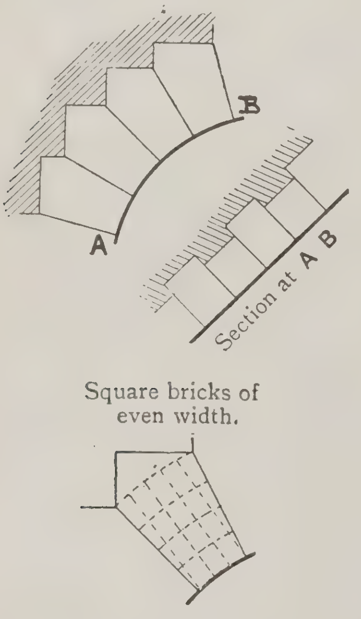

FIG. 17.—BRICK ARCH WITH STONE VOUSSOIRS.

Combinations of brick and stonework require very careful treatment. Examples of this class of work are too frequent to need more than passing reference to two typical cases (Fig. 16). If in a brick building the depth of the stone quoins is given on the drawing as 18in., while the brickwork is specified to be four courses to the foot, should the contractor get the stone ready dressed, with the chamfers worked, the stone 18in. deep will be found (when it comes to be set) not to agree with the brickwork. A ¼in. thickness will have to be dressed off one bed of the stone, and the chamfer to be re-dressed, because the thickness of the mortar joint has not been taken into account.

Or, again, suppose 3in. bricks are specified; then a stone 18in. deep will not suit at all, because with ¼in. joints the nearest number of courses will be 5in. by 3¼in. = 16¼in. or 6in. by 3¼in. = 19½in., in which case the quoins will have to be 16in. or 19¼in. in depth as they come worked from the quarries.

Again, take the case of a brick-arch faced with stone (Fig. 17). Here the inner face or soffit may work with 2¾in. bricks, but on receding from the soffit the length from the facing stones of even depth increases, and so must the width of the bricks, until a point is reached where an additional course can be worked in.

The use of stone in courses of even thickness is commonly met with in designs. A typical case is shown in Fig. 18. As it frequently happens that a contractor has to open a quarry for one particular contract, it must of necessity happen that he gets stone of varying thicknesses, but owing to the design he has to work these down to one uniform thickness. If designers would bear in mind that stone and brick are not the same material, and would give the contractor the option of varying the thickness of the courses, as shown in Fig. 19, the cost of the work would be lessened and the appearance would not suffer.

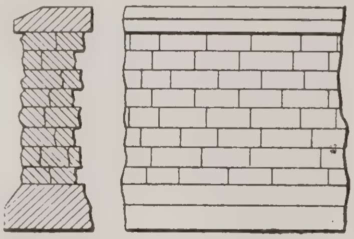

FIG. 18.

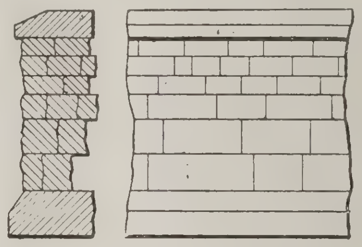

FIG. 19.

STONE WALLS WITH COURSES OF EVEN AND VARYING DEPTH.

The method of constructing centres on which brick or concrete arches have to be formed, and the means to be adopted for their ready removal, have given rise to much ingenuity; and while I do not propose to discuss the question, I will cite one example of the effect of a small detail of design, with reference to centering, on the cost of construction. Fig. 20 shows an arch to a culvert, which may be taken to have a span of 10ft., and the side walls to which are curved.

There is no special difficulty in constructing such a centre or the arch in concrete or brick, but it will be noticed that though it may be possible to lower the centre, say 1in., it is not possible to lower it sufficiently to enable it to be carried forward to be re-erected without taking it to pieces. In such case it might well be made somewhat as shown, in three pieces, with a vertical joint between them. The tie-beam having been removed, the two side pieces would have to be temporarily propped in place, and the middle portion taken out and carried forward to where it has to be re-erected, the two outside pieces being afterwards treated in the same manner. This process, however, entails considerable expense. Fig. 21 shows a similar culvert in which the arch has been reduced in area by an almost negligible amount by the insertion of a special form of brick at the springing. In this case the contractor is able to make the centre in one piece, which can be struck, carried forward and re-erected with much less labour, and consequently at much less cost.

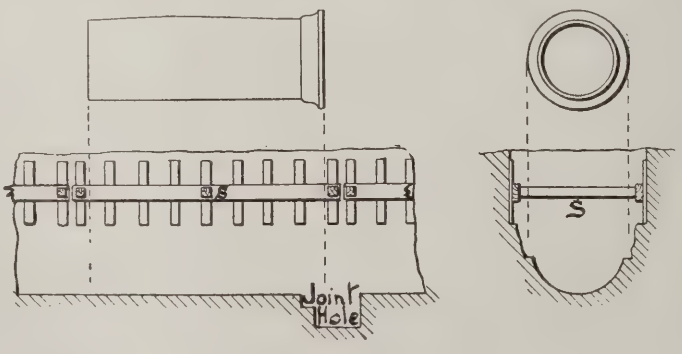

FIG. 22.

To take yet another branch of construction—the laying of water or gas mains, which are usually made in 9ft. or 12ft. lengths. If they are laid at some depth from the ground surface, the ground will have to be secured by temporary timbering. To get the pipe into place, it will be necessary to remove the middle strut (s, Fig 22) of each frame of timber and to replace it after the pipe has been lowered into place. If the pipes are 9ft. long, the contractor might elect to use wallings 12ft. in length, and as the unsupported length between the end struts while the pipe was being lowered into place would be say, 10ft., it would be possible to use wallings 3in. thick: but supposing the pipe was 12ft. long, the unsupported length would be at least 13ft.; the wallings would have to be at least 14ft. long, and the thickness would have to be increased to 4in., necessitating the trench being got out 2in. wider, a difference trifling in itself, but which might increase the total excavation by 7½ per cent., thus becoming a matter worthy of serious consideration to a contractor.

So much has been written and said recently on the subject of standardization that I will not dwell upon it, though it would be impossible to emphasize too much the importance of its bearing on the cost and methods of construction. I venture to hope that the day is not far distant when the question of the standardization of pipe joints will be settled. For some reason, best known to himself, every engineer appears to adopt a design of his own for pipe sockets. These designs only differ by the merest fraction from each other, but result in the pipe-founder having to keep a huge stock of socket patterns.

It may frequently happen that owing to the varying level at which a main has to be laid it is necessary to thicken the pipes at various portions of its length, to withstand

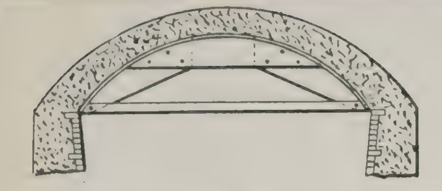

FIG. 20.

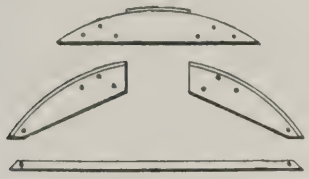

the crushing weight of the superincumbent earth, or to withstand the increased internal pressure due to the lower level (above ordnance datum) of a portion of the main. Naturally, the first consideration of the designer would be to keep the internal diameter the same, and increase the external diameter, the effect of which would be that the internal diameter of the socket of the adjoining pipe would have to be increased, entailing an increase in the external diameter to keep the thickness of the metal in the socket the same. If, however, the designer had maintained the outside diameter constant, and had reduced the internal diameter of the pipe, he would not have materially diminished the discharging capacity of the line of pipes, and would have all the sockets of one standard size.

Apart from the saving of the expense of making socket patterns for each thickness of pipe, attention should be called to the convenience of finding, if a burst occurred—and it was necessary to put in a new pipe at short notice—that the spigots and sockets of every pipe on the line of main were interchangeable.

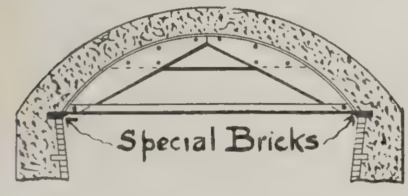

FIG. 21.

In conclusion, I wish to say that my sole object in presenting this paper has been to put before those whose lot is the design of details that the cost at which a contractor can take work depends largely upon these details of design.

Law Cases.

A Leicester Architect's Claim.—The decision in the case of *Hall* v. *Wright*, heard at Leicester last November, has just been given. The plaintiff, Mr. Amos Hall, architect, of Leicester, claimed £859 10s. from the defendant, Mr. Orson Wright, builder, of South Wigston, being the balance alleged to be due for his professional charges and services as architect, amounting to £1,469 8s., for the building of the Grand Hotel extension at Leicester. The defendant had before action paid the plaintiff £609 18s. 6d. on account of such charges, and had paid into Court a further sum of £175, which, he contended, was sufficient to satisfy the claim, leaving a balance of £684 in dispute. After hearing, the action was referred to a special referee, Mr. G. F. Hohler, barrister-at-law, who finds that the sum of £175 paid into court is more than sufficient to satisfy the claim of Mr. Hall, and that £9 3s. 6d. be repaid to the defendant. The arbitrator further directs that the costs be paid by the plaintiff.

Builders' Notes.

The Isolation Hospital, Pontypridd, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues and exhaust roof ventilators, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

Cardiff Painters' Strike.—The painters' secretary stated on Monday that twenty-two masters have now signed the new rules and that others are expected to do so. This is disputed by the employers' secretary. About 150 men are on strike, and about 150 are working on terms satisfactory to the Society.

Lifts.—Messrs. Easton & Co., Ltd., of Broad Sanctuary, London, S.W., have appointed Messrs. J. Lomax, Kendal & Co., of St. James's Square, Manchester, as agents for their electrical and hydraulic lifts for the cities of Manchester, Stockport and Salford, and all communications relating to lifts should be addressed to them. This agency is entirely separate from the superheater and general agency for Lancashire and the adjoining counties, which is conducted by Mr. G. D. Seaton from No. 49, Deansgate, Manchester.

The British Fire Prevention Committee announce their arrangements for the impending session, which will comprise some fixtures of more than ordinary importance. The Committee's testing operations will recommence on June 1st, and will this year comprise several tests with floors and partitions. The International Fire Prevention Congress, convened by the Committee, will be opened by the Lord Mayor on July 7th. The Association of the Chief Officers of Professional Fire Brigades will hold their annual meeting in London at the invitation of the Committee on July 9th. The National Fire Brigades' Union will arrange its annual competitions in connection with the International Fire Prevention Congress to commence on July 10th. The International Fire Brigades Council will meet in London on July 11th at the invitation of the Committee.

London County Council Brickmaking.—At last week's meeting of the Council the Housing of the Working Classes Committee recommended that the expenditure of a further sum of £2,500 be sanctioned in respect of brickmaking and ballast-burning on the Norbury estate during the season 1902–3. Mr. E. White held that the Council's brickmaking had been a failure. He strongly advised the Council to discontinue that disastrous experiment. Mr. Phillimore agreed that bricks ought not to cost 29s. 7d. per 1,000 to make, but regarded Mr. White's condemnation as too sweeping. Last year was an exceptionally bad year for brickmaking, and the men were new to the ground. Sir J. MacDougall defended the operations of the Committee, and anticipated a saving of 2s. per 1,000 this year. Lord Carrington, chairman of the Committee, assured the Council that this was a case of "much cry and little wool." There was not much to criticize and still less to condemn. The recommendation was agreed to.

The Building Trade in Natal. — The monthly report of the Master-Builders' Association of Pietermaritzburg states that during the month of March the building trades of the city were exceptionally busy in all departments. The trades, however, are still terribly handicapped owing to the scarcity of labour. Plasterers, bricklayers and carpenters are particularly in demand, the ruling rate of wages being 17s., 15s. and 15s. respectively. The cost of board and lodging in the city is £5 per month. Large contracts for buildings have just been given out, and others are about to be placed. Among them may be mentioned new post and telegraph offices, law courts, &c., so that during the next few years the building trades are likely to be exceedingly brisk, and constant employment would thus be assured to anyone emigrating to the colony. Tradesmen wishing to emigrate are requested to write to the secretary of the Master-Builders' Association, Pietermaritzburg, who will at once put them in communication with builders in need of men.

The Nottingham Society of Builders' Labourers have a standard rate of wages—which local builders and contractors, with few exceptions, recognize—of 6½d. to 7d., and they are pressing for the payment of this rate to all the builders' labourers employed on the work. The contractors, however, refuse to grant the request.

A Gravesend Hubbub.—The dissatisfaction and indignation aroused in Gravesend as the result of the failure of the Town Council to defend the action brought against them by Messrs. Davey, builders, who recovered £2,544 damages, with costs estimated at about £2,000, had free expression at the recent public meeting in the Town Hall, when, after much disturbance, a resolution was carried "That there appears to have been a want of good judgment and management on the part of the Council in carrying out the scheme for providing the town with an electrical service, thereby causing serious financial loss to the town, and also tending to lower the prestige of the borough; and, further, this meeting calls upon the Corporation to lay before the ratepayers a statement fully setting forth all the facts and circumstances relating to the matter."

Slag Cement. — The Chevalier C. de Schwartz, of Liège, read a paper last week before the Iron and Steel Institute on the manufacture of Portland cement from blast-furnace slag. He said the first attempts at producing slag cement were made at the Friedrich Wilhelmshütte in Germany in 1861, but owing to the limited field of application of the material and to its defects the manufacture made comparatively little progress. It is now about 8½ years since a slag-cement factory in Germany tried to remedy these shortcomings, and finally succeeded in making Portland cement from blast-furnace slag by mixing granulated blast-furnace slag with limestones in the same manner as is done with the materials used for making Portland cement; that is, by calcining the intimate mixture of these materials to vitrification, and by grinding the product of the calcining kiln into fine powder. The cement is of a very superior quality, and corresponds to that termed Portland cement. It had some advantages over natural Portland cement, as the yield from the raw materials with the former is about 80 per cent., whilst, when raw materials are used, it seldom exceeds 60 per cent. Besides, Portland slag cement, the author said, was more trustworthy and more regular, and its manufacture could be more easily controlled than that of natural Portland cement.

Obituary.

Mr. Charles Dawson, builder, of Dragon Avenue, Harrogate, died recently in his sixty-second year.

Mr. John Linton, J.P., of the Woodlands, Stow Park Circus, Newport, Mon., died last week in his sixty-third year. He was head of the firm of Linton & Geen, contractors, &c., who began the Tredegar Dry Dock, an undertaking which was successfully opened last autumn. Deceased was chairman of the Star Brick Co., the Westgate Hotels Co. and was connected with other undertakings. One of the sons of his first marriage is Mr. E. M. Linton, architect, of Newport.

Electrical Notes.

To Found a Chair of "Electrotechnics" at Liverpool University, in connection with the engineering department, Mr. David Jardine, shipowner, has given £10,000.

L.C.C. Electric Lighting Loans.—The London County Council decided last week to lend £200,000 to the St. Pancras Borough Council for electric lighting, and £10,000 to the Stepney Council for similar purposes.

Electric Welding.—The Sunderland Tramways Committee intends to give a trial to the Thermit system of welding tramway rails, under which it is believed a considerable economy will be effected, as it will prevent the hammering of the joints.

Price of Current at Salford.—The Electricity Committee of the Salford Town Council has fixed the price of electricity for power purposes after July 1st next at 2d. per unit up to 1,000 units, 1½d. for the next 10,000, and 1d. per unit beyond.

A Connection with the Mont Blanc Railway.—The Municipal Council of St. Gervais-les-Bains has adopted a scheme for the construction of an electric railway from Fayet, on the new line from that town to Chamonix, to the summit of Mont Blanc. The first section of the line, from Fayet to Aiguille-du-Gouter, is to be begun immediately.

Bristol's Electricity Supply.—The result of the past year's work shows that the use of electricity for power purposes has continued to increase. The sale of energy for this purpose during 1902-3 has more than doubled. The gross profits were £27,165, and after meeting financial charges a nett profit of £5,872 remains.

The New Asylum at Cardiff is to be lighted by electricity supplied by the Corporation. The South Wales Power Distribution Co. offered to supply 225,000 units per annum at 1½d. per unit, equal to £1,406 5s., but it was estimated that if the Corporation generated its own current it would only cost £706 per year, leaving £700 to meet interest and loan charges on the plant laid down.

Electrification of the "Underground."—The Metropolitan District Railway Co. expect to open a section of their line, six miles in length, between South Harrow and Ealing for electrical working in the course of a few weeks. The working of the main line by electric traction depends upon the date of the completion of the power-house at Lot's Road, Chelsea, which is being pressed forward as fast as possible.

A Vast Electric Power Scheme.—A Select Committee of the House of Lords had under consideration last Friday the North-Western Electricity and Power-Gas Bill. A company is to be formed with a capital of one and a half million pounds, and its operations will embrace the whole of the counties of Cheshire and Flintshire, with parts of Staffordshire, Denbighshire and Derbyshire. This area will be supplied from four huge generating stations. The average price which would be charged for Mond gas would be 2d. per 1,000 cub. ft., though the promoters were asking to be allowed to charge small consumers 4d.

The Overhead Trolley System for Derby is recommended by the Tramways Committee, who also propose to proceed at once with the construction of tramways on several routes which will not be affected by the main drainage scheme now being carried out. The Committee estimate that the construction of the permanent way on the routes in question will cost £55,915, that the electrical equipment will necessitate an expenditure of £10,150, that car-sheds and buildings will cost £7,000, and that twenty-five cars will cost £12,500. They are applying to the Council for £85,565 for the work.

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, 9, *East Harding Street, E.C.*

Abertillery (Mon.).—For the erection of a school for boys and girls and a school for infants, to accommodate respectively 540 and 396 children, along with the necessary out offices, boundaries and playgrounds, for the Aberystruth School Board. Mr. R. L. Roberts, architect, Abercarn, Mon. Quantities by architect:—

D. W. Davies, Cardiff	£13,200	0	0
D. Davies, Cardiff	12,865	0	0
Latty & Co, Ltd., Cardiff	12,836	3	5
N. Bagley & Co., Abertillery	12,418	16	6

Trade and Craft.

Some Modern Room Furnishing.

Messrs. T. Inglesant & Sons, Ltd., Horsefair Street, Leicester, have issued in pamphlet form a few examples of room decoration and furnishing executed by them from architects' designs. There is first the drawing-room at Hallaton Hall, near Market Harborough, which has some delicate plasterwork and two elaborate fireplaces (Mr. W. M. Cowdell, architect). Then comes an illustration of an ingle-work in the dining-room at Leicester Grange, Hinckley (Messrs. Keites & Fosbrooke, architects): and then follow the coffee-room fireplace and Empress room at the Grand Hotel, Leicester (Mr. Cecil Ogden, architect); and a doorpiece in the King's Hall of the same hotel designed by Mr. Amos Hall (this room is 80ft. by 40ft. and all the woodwork is Spanish mahogany). The King's Restaurant and Tudor Hotel at Leicester (Messrs. Goddard & Co., architects) are also illustrated.

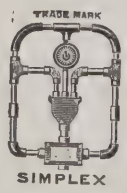
WALWYN T. CHAPMAN,

Terra Cotta Works, **CLEETHORPES.**



Simplex Conduits.

The "Simplex Steel Conduit System" is now recognised by all the leading authorities to be the **best method** of installing Electric Wires. It is now almost **exclusively employed** for all kinds of installation work.

ECONOMY and EFFICIENCY

are secured by the use of Simplex. Do not be satisfied with imitations. Every Conduit and Fitting stamped "Simplex."

We are devoting a big factory and all our energies to the bringing out of one product, and it is owing to this concentration of all our efforts that our system to-day stands in the **very front rank** of wiring systems.

New Companies.

Depaco Wallpaper Co., Ltd Capital: £2,000 in £1 shares.

Chrystal Paint and Varnish Co, Ltd. Capital: £1,500 in £1 shares.

Sam Deards, Ltd., roofing contractors. glaziers, engineers, &c., 34, Old Broad Street, E.C. Capital: £5,000 in £1 shares.

Granitic Paint Co., Ltd., manufacturers of varnish colours, paints, &c. Capital: £5,000 in £1 shares (1,500 preference).

New York Lumber Co., Ltd., timber merchants, wood workers, contractors, &c., 23, Wormwood Street, E.C. Capital: £2,000 in £1 shares.

George W. Nelson, Ltd., stone merchants, brick and tile manufacturers. contractors, builders, masons, &c., 3, Harrison Road, Halifax. Capital: £5,000 in £1 shares

London Victoria Iron Co, Ltd., ironmongers, builders, painters, &c., 7, Heath Street, Hampstead. Capital: £2,000 in £1 shares.

John Sibley & Co., Ltd., ironmongers, hardware merchants, &c., 26, Gabriel's Hill, Maidstone. Capital: £30,000 in £1 shares (7,500 preference).

Peasenhurst Quarry Co., Ltd., stone, granite and marble merchants, dealers in cement, lime, gravel, &c., 37, St. Peter's Street, Stamford. Capital: £5,000 in £1 shares.

London and North-Western Property Co., Ltd., property owners, estate agents, painters, plumbers, decorators, contractors, &c., 22, Lord Street, Liverpool, and 181. Rice Lane, Walton, Lancashire. Capital: £10,000 in £1 shares (4,750 vendors and 5,250 guaranteed preference).

Coming Events.

Wednesday, May 13.

Institute of Sanitary Engineers, Ltd.—Meetings of General Purposes and Finance Committee at 4.15 p.m., Election Committee at 5.15 p.m., and Council at 7 p.m.

Thursday, May 14.

Society of Antiquaries of London.—Meeting at 8.30 p.m.

Institution of Electrical Engineers.—Discussion on Mr. A. D. Williamson's paper on "Applications of Electricity in Engineering and Shipbuilding Works," and Mr. A. B. Chatwood's paper on "Electric Driving in Machine Shops," 8 p.m.

Surveyors' Institution (Junior Section).—Dinner at the Trocadero Restaurant at 7 p.m.

Friday, May 15.

Art Workers' Guild.—Paper on "Lead Work," 8 p.m.

Architectural Association.—Members' Supper at the Hotel Great Central, Marylebone Road, at 7.30 p.m.

Society of Architects.—Annual Dinner, Grand Hall, Prince's Restaurant, at 6 30 p.m.

Saturday, May 16.

Edinburgh Architectural Association.—Visit to Stirling Church and Stirling Castle. Leader, Mr. J. T. Baillie.

Northern Architectural Association.—Students' Sketching Club Excursions.

Monday, May 18.

Surveyors' Institution.—Discussion on Mr. H Trustram Eve's paper on "Modern Methods of Valuation of Manurial Residues," 8 p.m

Royal Institute of British Architects.—Sir Martin Conway on "The Formation of the Ancient Style of Egyptian Architecture," 8 p.m.

Tuesday, May 19.

Society of Arts (Applied Arts Section).—Mr. Cyril Davenport on "Mezzotints," 4.30 p.m

Institution of Mechanical Engineers.—Conversazione at the Institution, Storey's Gate, St. James's Park, 9 p.m.

Wednesday, May 20.

Chemical Society.—Ordinary meeting at 5 30 p.m.

Thursday, May 21.

Glasgow Architectural Association.—Annual Excursion to Falkland Palace.

Society for the Encouragement of the Fine Arts.—Mr. Arthur Diosy. F.R.G.S., on "Our Allies in the Far East."

Home Arts and Industries Association. Exhibition at Royal Albert Hall at 2.30 to 7 p m Open until May 25th.

Saturday, May 23

British Institute of Certified Carpenters.—Visit to the New Gaiety Theatre, Strand, W.C., at 3 p.m.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver.]

During the week ending May 9th eight failures in the building and timber trades in England and Wales were gazetted.

O. G. Pritchard, joiner and contractor, Liscard. R.O. May 1st.

E. Lee & Co., builders, Wealdstone. P.E., St. Albans C.C., May 26th, at 12.

J Dunn, road contractor, Harrogate. P.E. York Courts of Justice, June 5th, at 11.

Heatherley Brothers, contractors, Milford Haven and Pembroke Dock. R.O. April 27th.

E. Uphill, builder, Bath Gross liabilities £1,581 £1,376 to rank for dividend; deficiency £1,284.

D. Calder, contractor, Colwyn Bay. R.O. April 27th. First meeting, Crypt Chambers, Chester, May 13th, at 12. P.E., Bangor Magistrates' Room, June 4th, at 12 15.

F. Couzens, builder, Cardiff. First meeting, O.R.s, Cardiff, May 14th, at 12. P.E., Cardiff Town Hall, June 9th at 11.

G. Brown, builder, Anstey. Gross liabilities £4,810; £4,030 expected to rank for dividend; assets £2,342 deficiency £1,687.

A. D. Mitchell, builder, Derby. Gross liabilities £5,590; £1.421 to rank for dividend; assets £1,120; deficiency £319

A. Neesom, builder and contractor, Chorltum-cum-Hardy. £1,467 expected to rank for dividend; assets £13; deficiency £1,454.

T. Hunter, builder and contractor, Newcastle-on-Tyne. R O. April 29th. First meeting, O.R.'s, Newcastle, May 13th, at 11.30. P.E., Newcastle C.C., May 21st, at 11.

W. Flux, builder and undertaker, Newport, I.W. R.O. April 27th. First meeting, O.R.'s, Newport, May 13th, at 12. P.E., Newport Town Hall, May 25th, at 3.15.

James Bishop, stonemason, Bolton. R.O. May 1st First meeting, 19, Exchange Street, Bolton, May 15th, at 3. P.E., Bolton C.C., May 20th, at 3.30.

H. Bradby, lead, colour and varnish merchant, Brighton. R.O. April 28th. First meeting, O.R.'s, Brighton, May 13th, at 3. P.E., Brighton C.C., May 28th, at 11.

J. B. Platt, builder and contractor, Higher Hillgate, Stockport. R.O. April 28th. First meeting, O.R.'s, Stockport, May 14th, at 11. P.E., Stockport C.C., May 15th, at 11.

A Bankruptcy Petition has been presented by Mr. W. H. Brown, architect and surveyor, of Ipswich, against Mr. Samuel Sleigh, a former proprietor of the "Blue Boar Hotel," Cambridge.

The following companies are to be wound up:—

Devicolam Estates Co., Ltd., 12, St. Mary Axe E.C.

Royal Architectural Museum and Westminster School of Art. W. Pain, liquidator.

Shortwood Brick and Tile Co., Ltd. W. F Collins, Bath, liquidator.

Sussex Brick Co., Ltd.

A New Organ at St. Peter's Church Belfast, has been erected. The case, of carved oak, was specially designed and executed by Messrs. Harry Hems & Sons, of Exeter, under the supervision of the architect of the church, Mr. S. P. Close, A.R.H.A.

BRAMLEY FALL STONE in large quantities and any sizes,

ALSO

ROBIN HOOD STONE in Slabs, Landings, Steps, Copings, Heads, Cills, &c., all dressed ready for fixing.

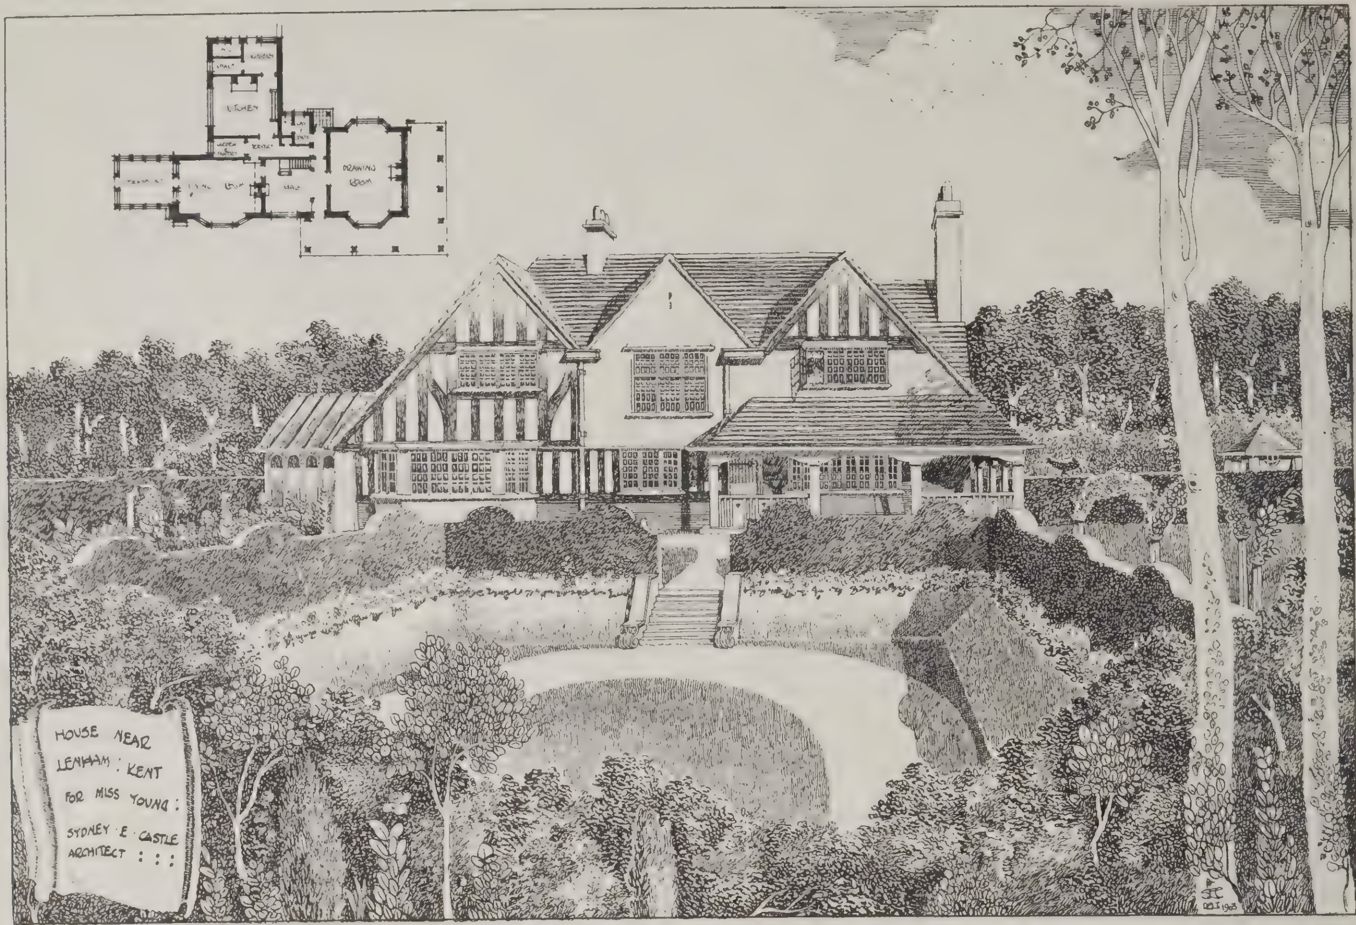
Liverpool Cathedral Award. MR. BODLEY and Mr. Norman Shaw have not been long in delivering their award in the Liverpool Cathedral competition. It is only a fortnight since they went down to inspect the designs submitted by the five selected architects, and their report was presented to the meeting of the Executive Committee held on Friday last. They recommended the adoption of design No. 1, by Mr. G. Gilbert Scott, but the Committee decided not to accept any of the designs: so that the competition again proves futile. In drawing up their conditions the Committee made a strong point of securing ample room for the congregation within sight and hearing of the preacher; and thus it seems that they verge on an impossibility, for there is a limit to the range of human hearing, and that limit must inevitably be exceeded in a vast building. There is a gulf fixed between St. Paul's Cathedral and Spurgeon's Tabernacle with its three-decker galleries. But though the Committee have rejected all the designs, their assessors are very eulogistic of the one they have chosen. They say: "What we had to find was not the best or the most beautiful drawings, but the best idea and the finest conception. Many of the drawings are attractive. But we had to look much further than that. We had to look at the real effect of the building rising to its final completion, at the dimensions and proportions of the different parts, such as the piers and arches of the great nave. We had to look at the practical and feasible aspect of the designs. We had to look for a sufficiently original conception. We had to look for a fine and a noble proportion, combined with an evident knowledge of detail. Lastly, we had to look for that power, combined with beauty, that makes a great and noble building. In the set of drawings marked No. 1 we find these qualities preeminently shown. We cannot but give it the first place. We should recommend that the quasi east end should be drawn with the towers shown, and that a window of fine size and proportion should be shown for that gabled end, one suitable to receive the offered gift of stained glass, a gift that will greatly add to the beauty of the interior." Of the five competitors (respectively, Mr. G. Gilbert Scott, Messrs. Austin & Paley, Mr. C. A. Nicholson, Mr. W. J. Tapper and Mr. Malcolm Stark) four sent in designs for the cathedral in the preliminary competition, and the assessors note with great interest that the new designs embody much the same general design and character as before: thus showing that the views of their authors were decided. "This seems to us good evidence that from the commencement they had offered of their best." Mr. Scott's design shows a cathedral of a total length of about 480ft. and an extreme width of 200ft. across the transepts (which have large towers over them); the height of the nave is 110ft.; the choir is 120ft. long, with a square chapel beyond flanked by a chapter-house and choir vestry: at the west end are two smaller towers over the baptistery and porch respectively. What the Committee propose to do next is a puzzle—presumably they will commission an architect of their own choice; meanwhile, from next Saturday, the designs will be on exhibition in the Walker Art Gallery, Liverpool.

The Cape University Competition. THE sixty-two sets of designs submitted for the new university to be erected at Cape Town are on exhibition in the north gallery of the Imperial Institute till May 30th, from 11 to 5. The conditions required a university hall of about 6,000 sq. ft. area suitable for all public ceremonials, with independent accommodation for members of the university and for spectators, in conjunction with which were to be a council-chamber, vice-chancellor's rooms and administrative offices: the whole to form the front of a quadrangle around which future extensions might be ranged. The assessor has awarded the three premiums as follows:—First (£400), Mr. W. Hawke, of London; second (£200), Mr. J. Edwin Forbes, Birmingham; third (£100), Mr. Edmund W. Wimperis and Hubert S. East, London. The buildings were required to cost £30,000, or £50,000 in Cape money, as there is a difference of sixty per cent. between European and Colonial values. The first-premiated design is undoubtedly the best. The author has adopted the only logical treatment, that is, with a semi-circular university hall and the several offices grouped symmetrically around it on the ground floor. The hall is well shown on the elevation, but the author would have done better to give an apse effect to the roof than a dome which is badly cut away at the platform end. The two other premiated designs show an entirely different treatment, having oblong halls; they are nothing like so satisfactory; the design placed second has a dome flanked by four towers, the back two of which are supported on the pendentives. The remaining designs are, as a whole, inferior.

Vauxhall Bridge. THE design for a steel bridge at Vauxhall with elliptical arches which was approved by the London County Council last November, when an expenditure of £170,000 was sanctioned for its erection, has been superseded by the revised design which we are able to publish as a centre-plate this week; and we must say that the collaboration of Mr. Riley with Mr. Fitzmaurice augurs happily for the future. The treatment of the spans is, we think, very pleasing and the parapet cleverly contrived, but the panels over the piers and, especially, the pylons are not at all satisfactory. The scale of the figures in the panel (presumably intended to be cast-iron work) is so much larger than life-size as to be quite out of proportion: indeed, the whole panel gives one the impression of a framed picture fixed on the bridge. For these panels £8,000 will be needed. As regards the pylons, the retention of which we understand Mr. Riley considers so essential, we have no objection to them *per se*. To take the most recent and very familiar example of the Alexander III. bridge at Paris, pylons can be made to give great dignity to a bridge even though there is absolutely no constructional necessity for them. But those shown in the revised Vauxhall Bridge design are not well treated. The manner in which they are built up, like blocked pilasters, is not pleasing, while we cannot understand why the square projection should have been put above the pediment—it looks for all the world like the top of a chimney. But, apart from æsthetic considerations, the Bridges Committee do not favour these pylons because they are estimated to add £10,000 to the cost of the bridge, and, further, it is feared that they would be dwarfed by the large blocks of buildings which are likely to be erected in their vicinity. In any case we think the bases might be retained and some statuary erected on them. It is worthy of note that these pylons have been considerably reduced in size to allow them to be erected on the foundations already built, and are proposed to be erected on the Westminster side only, where provision is also made for a possible extension of the Embankment; but the difference in level between the latter and the bridge approach is insufficient to allow carriage traffic, and gradients are thus needed with broad flights of steps on either side.



Law Cases.

Chemical Treatment of Sewage.—The case of *Reeves Chemical Sanitation, Ltd.*, v. *Mayor, &c., of Henley-on-Thames* was heard in the Chancery Division of the High Court of Justice last week. The defendants had determined to try experimentally the system of Messrs. Reeves & Brown for dealing with the sewage of Henley. An agreement was entered into under which the plaintiffs took over the entire working, control and management of the sewage and works at the outfall works previously managed by the defendants themselves, but this did not include the control of the town sewers. In April, 1897, the plaintiff company was incorporated, and the rights of Messrs. Reeves & Brown under the agreement were transferred to the company, which continued to carry on the work. On January 10th, 1903, the plaintiffs received a letter from the town clerk of Henley informing them that at a special meeting of the Corporation a resolution had been unanimously carried "That this Council is of opinion that the Harris-Reeves Syndicate has not been successful in preventing smells from arising at the outfall works nor in preventing a nuisance from arising in connection with the carrying out of the sewage operations there, and the town clerk is accordingly instructed, in pursuance of the agreement, to give the Harris-Reeves Syndicate fourteen days' notice to remove, at their cost and without any compensation whatever, all their special apparatus and plant now at the outfall works." This resolution of the Council was, the plaintiffs alleged, wholly without justification, as at the date thereof no complaints had been made by any person as to smells. The plaintiffs further alleged that the resolution was not passed *bonâ fide*, but maliciously, with the object of getting rid of the agreement with the plaintiffs so as to enable the Council to introduce another and cheaper system for the treatment of the sewage. In these circumstances the plaintiffs submitted that the contract had not been validly determined, and that in any case they were entitled to reasonable notice before the defendants could enter upon and take possession of the works and land. They claimed declarations accordingly, and an injunction to restrain the defendants from interfering with them in their treatment and disposal of the sewage.—After considerable evidence had been given, plaintiffs' counsel intimated that he could not carry the case any further.—Mr. Justice Farwell said that the system of the plaintiff company seemed to be a good one, but their own witnesses had admitted that at times there were smells at the outfall works. The Council had passed a resolution under clause 3 of the agreement (this provided that if valid complaints of smells were made and a nuisance was created the sanitary authority could call upon the contractors, without notice, at their own cost and without compensation, to stop the operations and remove the apparatus within fourteen days), and there was no evidence of improper motive or of want of *bona fides* with regard to that resolution. If contractors chose to sign an agreement containing such a clause they must abide by the consequences. The result was that the action failed and was dismissed with costs.

Dwelling-house or Store?—At the Sunderland Police Court last week John Miller was charged with erecting buildings contrary to the by-laws. The town clerk said the defendant's premises were situate at 182, Roker Avenue, and he was charged with erecting a new building, intended for a dwelling-house, without providing an open space of at least one-third of the site. In explanation of the charge Mr. Bowey said that in the case of a building built before 1851 any addition to it did not constitute a new erection, but in 1885, by the Borough of Sunderland Act, any addition was a new building, save that such addition were made solely for business purposes. Mr. Miller's premises were built before 1851. In July, 1901, he presented a plan showing that at the back of his property he proposed to erect a building exclusively for business purposes, and leaving only 32ft. of space, in lieu of 272ft. had the premises been intended for dwellings. The plan was approved, and the work commenced. But on inspection the building surveyor of the Corporation found that fireplaces and ceiling cornices were being put in, which had not been shown on the plans, and this was brought to the notice of Mr. Miller, who repeatedly said that no one was going to live in the property. The rooms had been described as store-rooms. In September and October the chairman of the Building Committee and the building surveyor visited the place, and found several of the rooms furnished and people living in them.—For the defence Mr. R. C. Nelson said the premises had never been used as a dwelling-house, but always as a store. Mr. Miller and his family were there early and late, and it was necessary for them to have some provision for cooking food and changing their clothes. There was no sleeping accommodation.—The bench decided that the building had not been used for business purposes, and on that point the Corporation's case was supported. They did not, however, think that the evidence supported the charge contained in the summons of erecting a building contrary to by-laws, so much as of occupying a building already erected for another purpose to that for which it was erected. For this reason they dismissed the summons.—The Bench agreed to state a case, but declined to allow costs to either side.

The House near Lenham, Kent, illustrated on this page, is proposed to be built for Miss Young at a cost of about £2,500; the walls of red brick with the upper part in white rough-cast and the roofs covered with red tiles: half-timber and woodwork to verandah in oak, and the interior of the hall and staircase to be treated in walnut with a canvas frieze. Mr. Sydney E. Castle, of The Studio, Louvaine Road, S.W., is the architect.

NEW MIDLAND HOTEL, MANCHESTER.

THE building of a large hotel in the centre of a modern city taxes the energies of both architect and builder to the greatest extent, for not only are there problems of planning and design to be solved but in the construction itself innumerable difficulties and restrictions are imposed by commercial requirements and public convenience. So that a large new hotel offers many interesting and instructive features. In the new Midland Hotel which has been built outside the Central Station at Manchester there have necessarily been examples of this, but attention has especially been drawn to the building by reason of the rapidity with which it has been erected. A year ago there was little more than its framework visible, with short heights of wall here and there behind the scaffolding, and girders half fixed; while now the huge work is almost completely finished. The builders are Messrs. William Brown & Son, of Trafford Road, Salford. Mr. Charles Trubshaw, F.R.I.B.A., of the Midland Railway Company's department at Derby, is the architect. As far back as the middle of last December the roof was being put on the topmost storey and the scaffolding taken down: and then for the first time it was possible to see the mass of the building, and how leviathan it appeared in comparison with the surrounding structures. Much warehouse property which formerly stood on the site (about two acres) had to be demolished, as well as the Gentlemen's Concert Hall, the People's Concert Hall and the Lower Mosley Street Schools. After these had been cleared away, and the excavations made down to the rock, the foundations were begun in September, 1899, but it was not until March, 1900, that the actual work of building was commenced. For the first 26ft., rising from the pavement, the front elevations are built of red Aberdeen granite with Shap granite bands, and thence to the roof they are of terra-cotta blocks.

The basement is confined to the usual stores of an hotel and the necessary appliances for heating and ventilation, the scheme for the latter being elaborate. Baths are also provided. In the intermediate basement are hair-dressing saloons, bathrooms, kitchens, &c. The ground floor on the Peter Street side has an entrance about 19ft. wide leading into a carriage court, with an inward and an outward way for vehicles. From this part it may be noted that access is given to a fine octagonal-shaped lounge on the first floor, which has a balcony for a band. From the lounge one may pass on the extreme left to a large room to be used as a coffee-room, or on the right to a French restaurant. On the Mount Street side of this restaurant is a covered court or winter garden—a large rectangle—having a raised terrace or platform for promenading purposes. Beyond the French restaurant and the winter garden are private dining-rooms. From an entrance to the hotel in Mount Street access is given to a luncheon-room overlooking Peter Street, and to a restaurant—on a larger scale than the French restaurant—with windows overlooking Mount Street. Besides the entrance in the latter street, already mentioned, is another nearer the centre of this side of the block. There is also an entrance for purposes of business and telephone communication. In Windmill Street is an entrance which will be mostly used for conveying luggage into the hotel. Following the line of the building towards the Central Station, one reaches another of the principal entrances directly opposite the station. This leads into an entrance hall for the new Concert Hall, which, under the terms of acquisition by the company, takes the place of the old Gentlemen's Concert Hall: and here it is hoped that the long-famous Gentlemen's Concerts of Manchester will be resumed with the same success as in days gone by.

The new Concert Hall, which is entered from Windmill Street, is on the first floor and is reached by a marble staircase. On the left of the hall are lounge- and reception-rooms. The lounge, already described as octagonal in shape, is entered from Peter Street. From this entrance passages lead on the one side to a private ballroom and dressing-room and on the other to a billiard-room. Passing into a long corridor, the visitor finds on this floor a number of private dining-rooms, bedrooms, bathrooms and sitting rooms running round the various sides of the building.

On the second floor is a winter garden or covered court, with an octagonal roof. The ventilation and efficient lighting of this has been well provided for. There is on this floor a continuous corridor leading to bedrooms and bathrooms.

On the third floor is a continuous corridor which runs all round the building. Here the great space representing the open court is well seen. The fourth, fifth, and sixth floors are practically a repetition of those below, and the top storey is covered by a Mansard roof of steel and fireproof materials. The whole structure has about 480 rooms, of which 400 are bedrooms.

Of the methods adopted by Mr. J. C. Stewart and the builders in the erection of the hotel we have already made brief reference only, for on previous occasions—as when describing the new Westinghouse Works at Manchester—we have dealt in some detail with these methods; indeed, when the matter comes to be set down in print there is not a great deal to tell, because the speedy erection of buildings has resulted more from foresight, close direction of work and good wages rather than the introduction of great labour-saving devices. The contractors know what they want and carry out their work in a definite systematic way—that is the pith of the matter.

Having now described the general features of the hotel, we may refer to some of the firms who have carried out their respective portions of the work.

The total amount of terra-cotta delivered by the Burmantofts Works, Ltd., of Leeds, has been 55,000 cub. ft., the whole of which was made to the architect's details and instructions. It has been formed in the "Burmantofts Vitreous" glazed terra-cotta, and the process of glazing the terra cotta inside has also been adopted, this process having been patented by Burmantofts a short while ago, with the idea of effectually preventing discoloration on the exposed face of the terra-cotta due to any exudation from the materials used in filling and walling. The whole of the modelling for the ornamental and enriched work has been done by the staff of modellers employed at the Burmantofts Works. When Mr. J. C. Stewart was called in to supervise the erection of the latter portion of the building, with a view to expediting its completion, he at once approached the Burmantofts Works with a view to arranging for a prompt supply of terra-cotta in order to enable him to carry out his undertaking. His wishes were met in all respects and delivery made within the time suggested, thus enabling him to complete his contract within the stipulated time. Messrs. Burmantofts are also supplying and fixing faïence decoration to the carriage-court from Peter Street; also flower boxes in faïence around stanchions in garden court, and faïence decoration in the corridor leading from the station to the winter garden.

Messrs. Pearce & Norquoy, of Ancoats, New Islington, Manchester, have supplied the well-known folding partitions of which they are the patentees and makers.

Very careful consideration was given to the internal walls of the building, and many systems were examined and tested. The order was ultimately given to the Fireproof Plate Wall Co., Ltd., of Manchester and London, who carried out the work in a very expeditious and satisfactory manner. The whole of the corridor walls and the walls dividing the rooms (except those required for constructional purposes), totalling about 30,000 yds. super., have been erected by this firm. The walls have been thoroughly tested for their fire-resisting and soundproof qualities, and being strengthened by the insertion of internal rods are exceedingly strong, allowing the construction of walls of practically any size. The corridor walls on the first floor are 15ft. high, and the wall dividing the stage in the Concert Hall is 72ft. long by 26ft. 6ft. high. A further use was found for these plates in the casing of the stanchions in the Concert Hall, 38ft. high, and other stanchions and constructional ironwork in various parts of the building; also in the formation of air-shafts and flues in connection with the system of ventilation. As an instance of the speed with which the work can be done we may state that more than 8,000 yds. super. of walls were erected in one month, and the whole of the order completed within the stipulated time.

A great deal of the glasswork has been carried out by Messrs. George Wragge, Ltd., of Manchester, including the whole of the stained and beaded glass for the Concert Hall and the leaded glass for the rooms forming the Royal suite. This firm also supplied the whole of the interior balcony rails (upwards of 320), the more important rails on the exterior (numbering 125), the balustrades to the main stairs and other parts, the railing around the hotel (including the electric-light standards), and the bulk of the metal casements (upwards of 800 in number).

Messrs. Stuart's Granolithic Stone Co., Ltd., of Millwall Dock, London, have executed the paving in some of the corridors, amounting to many thousands of yards, and, we understand, are also to carry out the courtyard.

Messrs. George Trollope & Sons, of London, executed their work from designs and sketches furnished by Mr. Trubshaw, the architect of the hotel. The Concert Hall, which is the largest room in the building, measuring 120ft. by 55ft. 6in. by 33ft. 6in. high, has been treated in the "Regence" style, the material employed being canvas plaster, with dados in the galleries and on the stage of wood painted white; the front of the stage and the dado, 5ft. 6in. high, which runs round the body of the hall, are in polished mahogany. The main ceiling is a large and simple vault divided into panels by enriched mouldings. The side galleries have vaulted ceilings springing from piers of square plan, the faces of which have panels and trophies of musical instruments. The walls also are panelled and similarly enriched. The general colour of the room is ivory and gold. The hangings are in a quiet green colour, intended to form a subdued background for the bright toilettes of the audience. The whole of the details have been carefully studied from good examples of the style by Messrs. Trollope & Sons' artistic staff. The supper-room, 96ft. long by 46ft. wide by 15ft. high, situated below the Concert Hall, is treated in the same style both as to colour and material. The reception-room to the Concert Hall is 40ft. by 24ft. by 15ft. 6in. high, and has an elegant ceiling-light of oval pattern. The reception-room to the supper-room is 40ft. by 24ft. by 12ft. 6in. high. Both these latter rooms are treated in the same style as the rooms to which they are attached. Messrs. Trollope have also executed the ceiling of the grand staircase, 26ft. by 21ft., the ceilings of the lounge, 55ft. by 13ft. and 21ft. by 13ft.,

both in canvas plaster, Italian in style, to harmonize with the marble work of the walls; also the ceiling of the corridor, 62ft. by 10ft. 6in., Italian in treatment, and consisting of five bays with domes in steel and curved and painted glass. The arches and vaults, together with the panelled archways at the end of corridor, are in canvas plaster. All the electric fittings in these rooms, excepting only the cornice lighting, have been supplied by Messrs. Trollope.

The warming and ventilation of the Concert Hall and supper-room have been carried out by the Sutcliffe Ventilating and Drying Co., of Cathedral Corner, Fennel Street, Manchester, on their well-known plenum system. Fresh air is drawn from the outside through a coke-filter screen by two 60in. Sutcliffe fans, which move together about 80,000 cub. ft. of air per minute. The filter screen effectually removes all smuts and impurities from the incoming air, and as the supper-room and Concert Hall are always under a slight plenum or air-pressure a pure supply is ensured and no air can enter through the doors or windows, thus keeping out all dust or fog. The air is warmed when required by two Sutcliffe multi-tubular steel air-warmers supplied with steam direct from the main boilers, and by means of a system of dampers either all hot or all cold air may be forced into any room, or any mixture of both as desired. The distribution of the air is by galvanized metal ducts built into the walls and connecting to registers admitting the air on all sides of each room. These registers have louvre control to shut off the air-supply to any point when necessary. The foul air is exhausted by two 36in. Sutcliffe electric fans fixed over the Concert Hall, and connected to outlet louvre registers placed near the floor and ceiling of both the Concert Hall and the supper-room. The whole plant has been working for the last three months and the heat thus being on has materially helped the decorators in drying the paintwork.

The Standard Sanitary Manufacturing Co. of Pittsburg (whose London offices and showrooms are at 22, Holborn Viaduct) are supplying all the bath tubs, sitz baths and lavatory tubs for the hotel. These baths and fittings were selected after very severe tests. Though installed in all the leading hotels in America, this is the first hotel in this country to be fitted throughout with them. The porcelain-enamelled baths supplied by the Standard Sanitary Manufacturing Co. are guaranteed to stand all extremes of heat and cold, however great, without crazing or cracking, even after the lapse of years, and they will bear the roughest usage without deterioration. This is of incalculable value in hotels and large institutions, for which all sorts of mechanical devices have been patented to prevent hot water entering a bath first, and to eliminate all chance of damage to the glazed surface. The baths of the Standard Sanitary Manufacturing Co. are finished outside to match the colour scheme of the bathroom, and are fitted with full-way valves and a special form of waste.

The grand entrance-hall from the Central Station approach, and the spacious staircase and lounge corridor leading to the Concert Hall, have all the walls faced with rich marbles, highly polished. The dado is of vert campan with moulded capping of the renowned verd antico marble and a base of vert des Alpes. The walls above this dado, and all the arches and columns, are of the old Greek Skyros marble, relieved with bands of vert campan, which forms a pleasing combination of colour, the markings in the Skyros panels being very curious and interesting. The handrail and balustrade of this staircase are executed in similar marbles, and the steps are of white Sicilian marble. The corridors and bathrooms on all the principal floors are lined 5ft. high with a dado of polished white Sicilian marble, with a neatly-moulded capping and base (altogether measuring considerably over a mile in length). The effect is cool and cleanly. This portion of the work has been successfully carried out by Messrs. J. & H. Patteson, of Oxford Street, Manchester.

The Crystalline Co., Ltd., of Stourbridge, are tiling the ceilings in many of the rooms with their patent Crystalline tiles set in special cement, having already done extensive work for the Midland Railway Company at the Queen's Hotel, Leeds. The tiles are manufactured from porcelain opal. They have a good "key," are true in shape, and do not crack; but to use them to best advantage they must be set in Crystalline cement, which expands and contracts at the same rate as the tiles themselves. The firm also has a system of decorating their Crystalline tiles by super-imposing layers of coloured glasses on them.

The metal casements fixed in the hotel by the Crittall Manufacturing Co., Ltd., of Braintree, are of their best section steel, with gunmetal fittings and gunmetal condensation gutters, all opening inwards. There are some hundreds of them.

Messrs. George Wright & Co., of Burton Weir, Rotherham, have supplied a large number of mahogany and oak mantelpieces, with tile panels and hearths.

Mr. John Faulkner, electrician, of Strangeways, Manchester, is fixing a system of conductors for the protection of the building from lightning. There are main conductors attached to the boiler chimney and the five flag poles on towers. These lightning conductors are fixed down the outside of the building and terminate in the ground about 20ft. below the street level. All the iron railings on the roof are connected by branch conductors with the main conductors on the towers.

The steelwork contractors were Messrs. E. Wood & Co., Ocean Iron Works, Manchester; Messrs. Dorman, Long & Co., Middlesbrough; and Messrs. The Patent Shaft and Axletree Co., Wednesbury.

Messrs. Davies Brothers, Manchester, have done the asphalting.

The cabinet work has been carried out by Mr. W. Höfler, London; Messrs. Marsh, Jones & Cribb, Leeds; Messrs. Trollope & Sons, London; Messrs. Waring & Sons, London; and Messrs. Waring & Gillow, London and Manchester.

Messrs. Cordingley & Sons, Bradford, have done some of the concrete paving.

The fireproof flooring has been fixed by Messrs. Fawcett & Co., London (floors, ceilings and roofs on "Mark Fawcett" system having been fixed at the rate of 1,000yds. per week), and Mr. B. Morton, Manchester.

Some of the fireproof partitions, &c., and encasements to beams have been executed by Messrs. Banks' Fireproof Construction Syndicate, London, and the New Expanded Metal Co., London.

Collapsible gates were supplied by the Bostwick Gate and Shutter Co., Manchester.

Patent glazing to roofs was carried out by Messrs. Mellowes & Co., Sheffield.

Grates, mantelpieces, &c., were supplied by Messrs. Derwent Foundry Co., Derby; Messrs. Fletcher, Russell & Co., Manchester; Messrs. Micklethwaite & Co., Rotherham; Messrs. Newton, Chambers & Co., Manchester; Messrs. Steel & Garland, London and Worksop; Messrs. Waring & Gillow, Manchester and London; and Messrs. Yates, Haywood & Co., Rotherham.

Messrs. Ashwell & Nesbit, London, have done some of the heating and ventilation.

The hairdresser's saloon has been fitted up by Messrs. Parton, Sons & Co., Birmingham; the india-rubber paving laid by Messrs. Macintosh & Co., Manchester; and some of the lead-glazing executed by Mr. R. Bennett.

Locks and hardware were supplied by Messrs. Markt & Co., London, and Messrs. C. Smith, Sons & Co., London.

Marblework by Messrs. A. Lee & Brothers, Bristol; Messrs. Fenning & Co., London; and Messrs. Doulton & Co., London and Manchester.

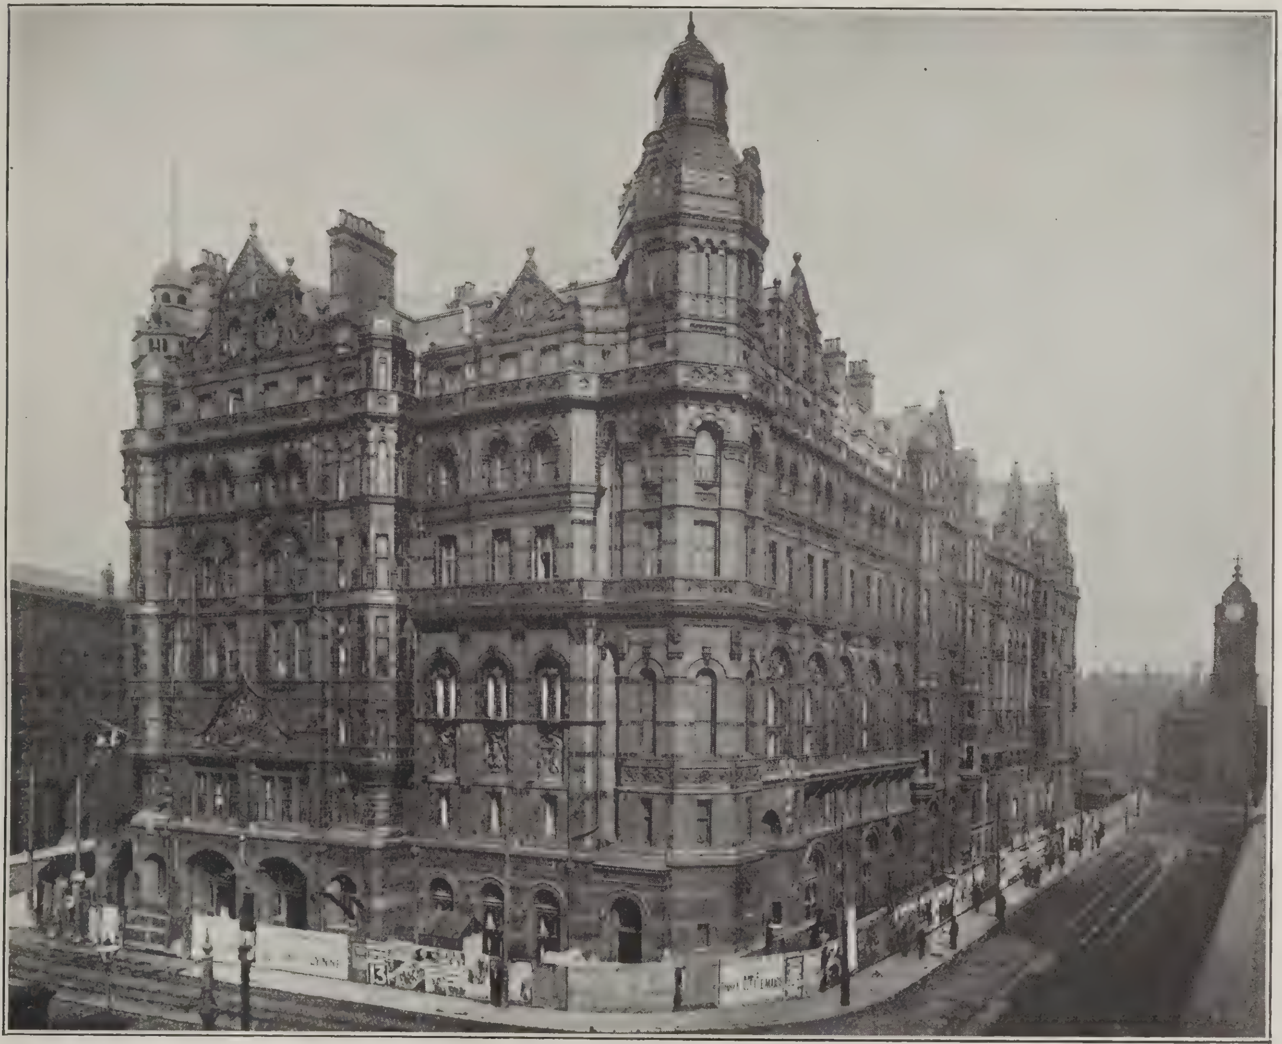
Marble terrazzo and mosaic paving by Messrs. Geary, Walker & Co., London; Messrs. Diespeker & Co., London; and Messrs. Waring & Gillow, Manchester and London.

The plasterwork has been executed by Mr. C. E. Harwood, Manchester; Mr. J. W. Hindshaw, Manchester; Messrs. Trollope & Sons, London; Messrs. Waring & Gillow, Manchester and London; Messrs. Marsh, Jones & Cribb, Leeds; and Messrs. Waring & Sons, London; and the painting by Mr. C. E. Harwood.

Revolving doors were supplied by Messrs. the Van Kannel Revolving Door Co., London; and sanitary fittings, &c., by Messrs. Doulton & Co., Manchester and London; Messrs. Holroyd & Co., London; and Messrs. Morrison, Ingram & Co., Manchester.

Messrs. Williams & Co., Manchester, and Mr. John Norton have done some of the tiling; Messrs. Braby & Co., Liverpool and London, the zinc work; and Messrs. the Princess Art Metal Co., Manchester, some of the railings and gates.

The representative of the Midland Railway Company says: "The hotel will combine all the novel features of American and Continental hotels with the solid comforts of an English home, and will, it is confidently expected, influence the future of all English hotels both from a structural and managerial point of view. The numerous restaurants, lounges, &c., will undoubtedly change the social life hitherto pursued in provincial towns so that the opening of this hotel may be said to form an epoch in the catering calendar."



THE NEW MIDLAND HOTEL AT MANCHESTER. CHARLES TRUBSHAW, F.R.I.B.A., ARCHITECT.

Two large Stained-Glass Windows have been fixed on the grand staircase of the new Grand Hotel, Harrogate. They were designed and executed in the studios of Messrs. Kayll & Co., of Albion Street, Leeds, and portray subjects representative of the ancient names of Harrogate and the surrounding towns.

THE SOCIETY OF ARCHITECTS.

ANNUAL DINNER.

THE nineteenth annual dinner of the Society of Architects was held at the Princes' Restaurant, Piccadilly, W., on Friday evening, the chair being occupied by the president, Mr. Silvanus Trevail, J.P., F.R.I.B.A., who was supported by a large and representative gathering, including Canon Vere, Lord St. Levan, Viscount Clifden, Sir Arthur D. Hayter, Sir Edwin Durning-Lawrence and several other members of Parliament, General Festing, Sir William Treloar, Sir H. Trueman Wood, Judge Rentoul, the Lord Mayor of Liverpool, the mayors of several London boroughs, the masters of the Painters' and Carpenters' companies, the presidents of the London Master-Builders' Association, Surveyors' Institution and Institute of Builders, and of the Liverpool, Cardiff and Aberdeen architectural societies, the clerk to the London County Council, and others.

The loyal toasts having been proposed by the president, Mr. Andrade Harben, Mayor of Paddington, proposed the "Houses of Parliament," which was responded to by Lord St. Levan and Sir Walter Foster. Alderman Sir William Treloar proposed the toast of "The Imperial Forces of the Empire," which was responded to by General Festing. Sir Arthur D. Hayter, Bart., M.P., in proposing the toast of "The Society of Architects and Architecture," referred to the debt of gratitude the public at large owed to the architects for their endeavours to beautify the towns. He hoped that the Bill for the registration of architects which the Society had promoted in Parliament would be passed. If that Bill became law it would reduce the large number of insanitary and jerry-built buildings erected, and local authorities would employ properly qualified men. The president, in reply, said:—

At no period in our history as a people, a nation or an empire has the work of the architect been more important than it is to-day. Never before were there so many and so varied a collection of architectural problems to be solved, nor of such an exacting character. This applies no less to buildings of the commercial class than to those of the domestic, the ecclesiastic or the municipal, with all its sub-divisions of hospitals, asylums, educational or other classifications that might be multiplied indefinitely. The scope of an architect's duties is a very wide one. It requires in the properly-qualified practitioner a man of good education, a travelled man, a man of keen observation, a man skilled in the science as well as in the art of his profession, with a knowledge of the latest appliances and the latest developments of all those specialities which go to make a successful building, and at the same time a keen discrimination so as to weed out and to avoid in his client's interest the bad. In short it requires a highly-trained man with many years' experience before he can undertake the responsibilities of a principal. This means time and it means money. And what we say is that when a man possesses all this to the satisfaction of an examining body appointed by the State he should be registered by the State as a qualified practitioner, just as much as the physician, the surgeon, the barrister, the surgeon-dentist or the chemist. We do not say that a man not possessing the requisite qualifications and not registered may not design and superintend the erection of buildings, but what we do say is that the State shall in its own interest tell the general body politic who is so qualified; and then if they employ an unqualified man it will be their own fault just as much as if they went to a quack doctor and got killed as the consequence. Now, with all the developments of sanitary science, for example, is it to be expected that the nearest auctioneer or estate agent or his clerk around the corner, who has to do all the cataloguing and ticketing of an auction sale one day, can design a mansion or a villa the next and see to it that the drainage, its ventilation, traps and connections are all right. The thing is absurd, and what we say is that the man doing such work should, in the interest of the general public, be trained and skilled, and afterwards duly registered by the State. This would protect the public, who are not always as discriminating upon such matters as they ought to be. To this end the more active spirits among us have promoted an Architects' Registration Bill, which is now before Parliament, that will, I hope, commend itself to all the gentlemen I see around me, and eventually become the law of this land as much as it is already the law of almost every important State on the continents of Europe and America and in our Colonies. As we have so many municipal chieftains here, I may perhaps be allowed to take this opportunity of congratulating them upon the great street and other improvements that are taking place all over the country.

We as architects say—continue in this course, but now and then call to your aid the skilled trained mind to advise you as to how the improvement may be best made and the space properly and artistically utilized afterwards. Often the very best opportunities are thrown away for want of this, and spaces and sites that might have been things of beauty and joys for ever given up to the advertizing fiend, who does not as a rule care how many abominations he creates so that his pockets may be filled by the illicit puffing of some worthless nostrum. These huge letters on buildings destroy all sense of dignity, taste and proportion. These plasterings of public conveyances, so that the last thing one can discover is the point of either destination, are an abomination and a scandal that England should be ashamed of, and which do not exist in the same degree in other civilized States. Soon to design a commercial building in a leading thoroughfare the chief problem will be, not a dignified sense of proportion, style and architectural balance, with columns, entablature, cornices, mouldings, &c., properly adjusted and proportioned, but how much flat wall surface can be provided for these advertizing monstrosities. Another reason has been mentioned for the bad architecture in England as compared with that of other countries in buildings of the ordinary class. Here we are tied down by the short lease system of 99 years or even less. There no one dreams of building excepting upon the actual freehold or, like they have in Scotland, the perpetual feu. This, of course, means good design and good building, because the person who builds is secured in his holding. But, under the short leasehold system, the leaseholder of course builds so far as he possibly can only to last his lease out, and the effect is apparent all around us, and especially to those who compare buildings here with what they have seen abroad.

Mr. J. Woolfall, President of the Liverpool Architectural Society, also responded. Mr. H. E. Duke, M.P., proposed "The London and other Local Authorities," which was responded to by Alderman Sir H. E. Knight, past Lord Mayor of London; Mr. R. A. Robinson, Deputy Chairman of the London County Council (who referred to the need for a county hall for London, and the difficulty of finding a suitable site), and Alderman W. J. McLellan, Mayor of Rochester. Mr. G. Gard Pye, Vice-President of the Society of Architects, proposed "Our Guests," and Mr. W. Watson Rutherford, Lord Mayor of Liverpool, in response referred to the beauty of the Wilhelmstrasse at Wiesbaden, which he attributed to the by-laws insistin that no two buildings on it should designed alike nor on the same line of fron age, the contrary of our regulations. Mr. V C. Pendarves, Vice-Chairman of the Corn wall County Council, also responded. Th Hon. W. Massey-Mainwaring, M.P., propose the "Arts and Crafts allied to Architecture which was responded to by Mr. William King, President of the Institute of Builders.

Bricks and Mortar.

Aphorism for the Week.

Extravagance and absurdity have still the law, and should pay as rigid obedience to as the primmest thing on earth.—NATHANIE HAWTHORNE.

Our Plates. A reference to the ne Vauxhall Bridge will found on p. 201 of this issue.—The house an lodge at Pyrford Common, near Wokin Surrey, are being built for Mr. F. Walters fro designs by Mr. C. F. A. Voysey, of 23, Yo Place, Baker Street, W. Mr. F. Müntzer, 16, Dover Street, Piccadilly, and Farncomb Godalming, Surrey, is the builder. Th material is, for economy, brick cement rough cast, with tile roof, Monk's Park stone windo dressings, and iron casements. The sun an view are both on the same side of the house

Checking the Advertiser. No. 9 of "A Beautif World," the journal of th National Society for Check ing the Abuses of Public Advertising, is abou to be issued to members. It covers the tran actions of several years, and is therefore unusual bulk, there being 134 pages. Matte of special interest are the Prussian Act f prohibiting the disfigurement of landscap (the report of the Landtag appears now English for the first time); the conferenc held in March with the leading bill-postin firms with a view to ascertaining and, possible, to meet their objections to th establishment of municipal control; and th steps taken towards forming local associa tions for developing an interest in th "æsthetic amenities of their respective neig bourhoods." The Society allows itse to hope that the "John Evelyn Club already formed for Wimbledon is only th first of a network of such defensive an educational agencies. An attempt has bee made to distinguish in the table of conten the subjects of fresh importance from tho which must be said to form permanent featur in the Society's "dossier," and the retrospe is intended to be an abstract of its wo from the beginning (1893) up to the presen The Society may count among the results its protests the abolition of sky-signs London, the prohibition of transpare advertisements in tram cars on lines co trolled by the L.C.C., the prohibition of flas lights and illuminated advertisements of kind dangerous to traffic, the cessation flash advertisements on the Nelson Colum the removal of the monster lettering from th Shot Tower near Waterloo Bridge, and th prohibition of advertising on railway bridge while successful protests were lodged Edinburgh in 1899, Glasgow in 1900, Dove in 1901, and elsewhere. The presiden of the Society is Dr. Longstaff, the hon auditor Mr. Basil W. Hardcastle, and th secretary Mr. Richardson Evans (1, Cam View, The Common, Wimbledon).

The A.A. Members' Supper was held at the Hotel Great Central on Friday last, with Mr. Henry T. Hare, the president, in the chair. The attendance was the largest on record. An excellent entertainment was provided by Mr. Harrison Hill, Dr. Byrd Page Mr. Haydn Wood and Mr. Seth Hughes.

Enquiries Answered.

*ıe services of a large staff of experts are at
the disposal of readers who require informa-
tion on architectural, constructional or legal
matters. Questions should in all cases be
addressed to the Editor. The querist's name
and address must always be given, not neces-
sarily for publication.*

Removing Cement on Tiles.

Turriff.—Aberdeen writes: "Is there
y chemical or solution which would help
clean or soften cement on enamelled
es?"

The cement can be removed by the appli-
:ion of hydrochloric acid (spirits of salts).

R.I.B.A. Preliminary Examination.

Cardiff.—Pupil writes: "Having served
ee years as a pupil in an architect's office,
ım thinking of entering for the R.I.B.A.
:liminary examination. Would it be
visable for me to do so? If so, what
ɔks do you recommend for study?"

Yes. A list of suitable books and all in-
mation is to be found in the R.I.B.A.
lendar (price 2s. 6d.).

Old Bricks for Rough-cast House.

South Norwood.—C. T. M. writes: "I am
ɔut to have a house built at a cost of
ɔo, and my builder suggests, as it is to be
.gh-cast, that I should use old bricks
ich he has secured from Christ's Hospital.
ese certainly are like iron, whereas the
zzles obtainable in the neighbourhood are,
nparatively speaking, soft and crumbly.
ıich would you recommend? The builder
s he does not care which is done."

The reason of the builder's indifference is
be traced to the difficulty of laying old
cks, which can never be quite cleaned,
king up for the extra cost of new bricks.
t we advise you to have the old bricks
d, as they are harder.

Books on Engineering and Masonry.

Carlisle.—Theodolite writes: "Kindly
e me your opinion on the following
ɔks:—(*a*) 'Civil Engineer's Pocket Book,'
John C. Trautwine; (*b*) 'Masonry Con-
ıction,' by Ira O. Baker; (*c*) Stephenson's
timating.' What is a suitable book
.ling with masonry as applied to engineer-
, also a book on estimating the cost of
;ineering works?"

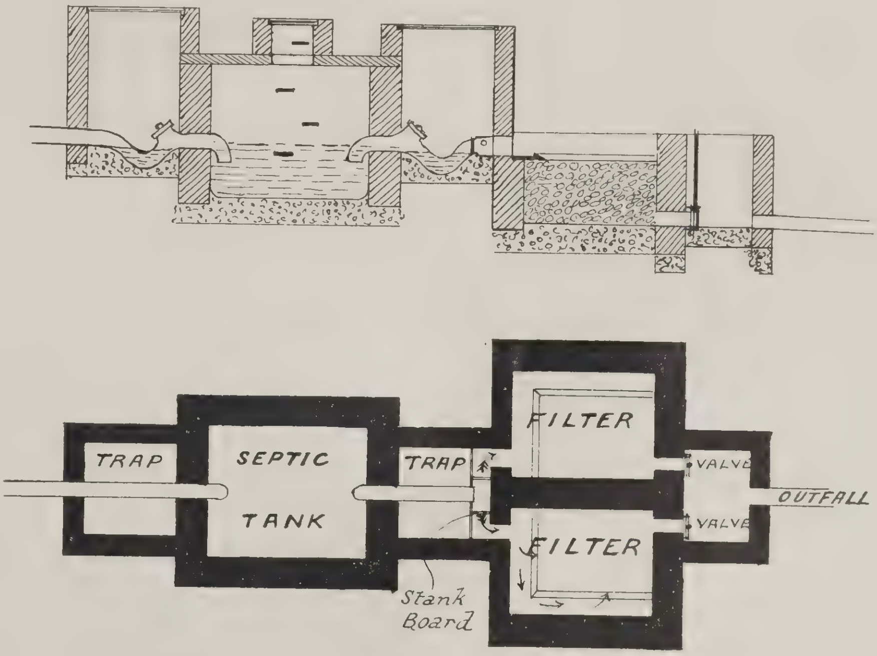
a) Trautwine's Pocket Book is one of the
st useful books an engineer can possess;
Baker's "Masonry" is the most complete
ɔk on the subject—this deals with
ineering masonry; (*c*) Stephenson's Esti-
ting is the standard work on the subject.
ınswer to the last question, "Engineering
imates, Costs and Accounts" (Crosby
ckwood, 12s.).

A Scheme of House-Drainage.

Cardiff.—Excelsior writes: "The ac-
ıpanying sketches (not reproduced) show
cheme of drainage for a house designed to
an improvement on the old cesspit system.
e sewage is brought from the house (not
ter drains) in pipes, properly ventilated,
the inspection chamber. From this the
age runs into a tank, and from the tank
ows to the filtering bed as shown. The
ı is to have the large tank kept air-
ıt to act as a septic tank, and to do this
inlet and outlet are turned down. The
ıent passes from the tank through land-
in pipes, surrounded by rough rubble, an
ıngement designed as a filter bed. (1)
uld the turning down of the inlet and
let pipe into the sewage tank lock the
in the turn-down pipes when the sewage
came up about their invert levels, and thus stop flow? (2) Is an air inlet necessary to effect the proper working of the tank?"

The scheme detailed will not work; to be frank, it is no better than the ordinary cesspit, which "Excelsior" wishes to avoid. If the septic tank is to be adopted several modifications and additions are required. The action of a septic tank is not to *purify* sewage but to *putrify* it as a preliminary to purification. By means of the anaërobic bacteria the solids in the sewage are broken up, and liquified. But the effluent is foul, and requires further purification by aërobic bacteria, which can only exist where there is a plentiful supply of air; and "Excelsior" will see that his scheme of filtration under ground will fail. As his scheme stands, the foul effluent would only poison the surrounding ground, just as does the leakage from an average cesspit. As there are one or two other points that require alteration, a sketch plan and section of a small septic tank system is illustrated here. Both the inlet and outlet pipes to the septic tank must be on the same level, and trapped. If "Excelsior" uses traps with cleaning arms, the stoppers must be secured, as gas is generated in the tank during the decomposing process. "Excelsior" should arrange for an escape pipe, fitted with an ordinary stop-cock, so that the gas can be burnt periodically. It has a non-luminous flame, which can be made luminous by the addition of an incandescent burner and mantle. (The sewage outfall works at Exeter are lit in this manner.) It is not absolutely necessary that a septic tank should be covered, as in the course of a few days a thick impervious scum will form on the top of the sewage, and under this the bacteria can thrive and work. At the same time, if the tank is anywhere near houses it is desirable to have it covered for obvious reasons. The sewage in the tank and the scum on its surface must be disturbed as little as possible. It is desirable to arrange for the sewage to enter the tank below the invert level of the pipes; this can be effected by turning down the ends of the inlet pipe, as shown by "Excelsior" in his sketch. Various methods for the egress of the liquified sewage are in vogue; but a similar pipe with the end turned down will suffice in a small scheme. The tank effluent passes through the second trap to the filter beds. There must be at least two of these, so that one is resting while the other is filling. The effluent when discharged from the second trap flows into a concrete channel in which are placed two stank boards so that the flow can be shut off either filter bed. The effluent passes with a ½in. drop from this concrete channel through an aperture in the filter bed wall into a wooden trough running round two sides of the filter bed. This trough must not be more than ½in. deep. and should be fixed perfectly level all round. (It is desirable also that the trough be removable, so that it can be lifted out when the filter bed requires cleaning. This can easily be effected by allowing it to rest on wooden brackets fixed to the wall, or on projecting bricks built in.) The outer edge of this flat trough should have a sloping lip. The object of this trough arrangement is to keep the effluent from running down the wall of the filter bed, and to ensure that the stream flows on to the bed in a very thin film, so that it can obtain a maximum exposure to the air. The filters are filled with furnace clinker broken to pass a ½in. ring free from dust. The clinker should be filled in level with the bottom edge of the trough lip. The filter-bed floors may with advantage slope to the discharge valves. These may be of Penstock or other approved type. The outfall may be connected with any land drainage system, or run over the land, or caught in a tank and used for garden watering. Being rich in nitrates, it is excellent for the latter purpose. The chambers can be constructed in concrete entirely or stock brick. In both cases the interior faces require cement rendering. If the interior is faced with blue brick in cement-mortar, the rendering will not be required. As to size, "Excelsior" is advised not to make his chambers too large. If the scheme is to deal with the sewage of one house only, it is advisable that each filter-bed should not take longer than a day to fill. The septic tank shown is about 6ft. by 4ft.; the filter-beds slightly smaller. The intercepting chambers should, if fairly deep, be large enough for a man to get down; the septic tank should be high enough for a man to stand and work in, as there is a residuum in the tank that requires removal from time to time. The septic tank should have an air-tight cover; but the intercepting chambers only require light open grids, hinged to frames built in, to allow of easy access. Step-irons should be provided if necessary.

J. H. E.-D.



SMALL SEPTIC TANK SYSTEM FOR A PRIVATE HOUSE.

Hiring a Steam Navvy.

CARLISLE.—W. B. writes: "Where can I hire a steam navvy to lift about 60,000yds. cube of loose earth embankment? How many yds. would it lift per hour, and what would it cost per month with driver?"

I think you may have a difficulty in getting a steam navvy on hire. I would recommend you to advertise for one.

M. POWIS BALE.

Civil Service Examination for Clerk of Works.

WOBURN.—CIVIL writes: "Where can I obtain information respecting Civil Service examinations for clerks of works?"

A set of former examination papers may be obtained from Messrs. Eyre & Spottiswoode, East Harding Street, Fleet Street, London, for the position of clerk of works in H M. Office of Works, dated March, 1895, price 1s. A study of this will show what the subjects are, and what amount of preparation will be necessary. Vacancies for these appointments do not often occur, but preparation for them would be useful for other examinations.

HENRY ADAMS.

Pressure of Wind from its Velocity.

PLYMOUTH.—VENTUS writes: "I measured the portion of a stone obelisk overthrown in Mauritius during the cyclone of 1892. Taking weight of stone 170lbs. per cub. ft., the overturning pressure per sq. ft. would be 141lbs. Would the velocity of wind work out to 168 miles per hour? Presumably the mean pressure has nothing to do with this case. During this cyclone the anemometer at the observatory was blown away and no record was available."

Hawksley's formula for the pressure of the wind from its velocity was $p = \frac{0{\cdot}0765\,v^2}{32}$ where v = velocity in ft. per sec. and p = pressure in lbs. per sq ft. (Min. Proc. Inst., C.E, LXIX., p. 201). Transposing this, $v = \sqrt{\frac{32p}{0{\cdot}0765}}$, then with a pressure of 141lbs. per sq. ft. $v = \sqrt{\frac{32 \times 141}{0{\cdot}0765}} = \sqrt{5898} = 242{\cdot}8$ft. per sec., and $242{\cdot}8 \times \frac{60 \times 60}{5280} = 165{\cdot}54$ miles per hour. Approximately $p = \left(\frac{v}{20}\right)^2$, or $v = 20\sqrt{p}$, whence $v = 20\sqrt{141} = 20 \times 11{\cdot}874 = 237{\cdot}48$, and $237{\cdot}48 \times \frac{60 \times 60}{5280} = 162$ miles per hour.

HENRY ADAMS.

Making a Schoolroom Cooler.

WOODBRIDGE.—NORMAN writes: "A schoolroom is built of wood, covered with corrugated iron and lined with felt inside and ¾in. matchboards. It is quite open to the apex of the roof and is well ventilated, but in the summer the heat is unbearable. Can you suggest an inexpensive means of reducing the heat?"

We advise you to use slag-wool slabs for lining the interior, filling in the cavities with slag-wool.

British Fire Prevention Committee Tests.

BIRMINGHAM.—A SUBSCRIBER writes: "Do the British Fire Prevention Committee undertake tests free of charge? If not, what are their charges and to whom should I apply? I have a patent for improvements in asbestos for buildings, but through lack of funds cannot put in on the market."

The British Fire Prevention Committee do not undertake on their own account fire tests of patented constructions or specialities of individual makers: these are subject to an independent tariff consisting of (1) preliminary expenses, (2) establishment charges and (3) testing charges—the first £5 5s., the second from £10 to £50, and the third from £50 to £150, according to the nature of the test and the group to which it belongs. A full account of the Committee's requirements will be found on p. 347 of our issue for January 1st, 1902: further particulars can be obtained from the offices of the Committee at 1, Waterloo Place, Pall Mall, S.W. Patents are generally a speculation and (especially such as you own) need to be well backed with capital. Your best course would be to approach some manufacturer of fire-resisting materials and endeavour either to sell your invention to him outright or on a royalty; but this is no easy thing to do.

Noisy Cistern.

CARDIFF.—CARDIFF writes: "The accompanying plan (not reproduced) shows the position of a W.C. and library in a house. The discharge and refilling of the cistern are heard too plainly in the library. Would the removal of the whole apparatus to the outside wall do away with the nuisance, or is there some other method, without altering the position, by which a silent flush or refill can be obtained?"

The sketch plan does not give any dimensions, so it is impossible to say whether space is available for putting the apparatus on one of the other walls. At the same time, it is inadvisable to put the cistern on the outside wall, where it would be liable to freeze in winter. The best method would be to instal a cistern with silent refill and flush on the interior wall against the staircase, and put a sound-deadening covering to the library wall, either of felt, patent slabs, sawdust, &c.

J. H. E.-D.

The Reredos in Benhilton Church, illustrated on this page, was recently executed by Messrs. Harry Hems & Sons, of Exeter, from designs by Mr. W. Hilton Nash, F.R.I.B.A. It is entirely of Devonshire grown oak, and is in the fifteenth-century style. On either side of the altar are sunk and traceried panels with apple trees in bold relief. The super-altar is richly carved. In the centre is a shield with the monogram IHS, and on the other shields are carved the crossed keys of St. Peter and the swords of St. Paul. Tendrils of the Vine and the wheat as emblematical of the Blessed Sacrament are carved on either side. The whole of the work is put together without nails or screws, all the tenons being fastened by oak pins.

Correspondence.

Winchelsea Church.

To the Editor of The Builders' Journal.

Brighton.

Sir,—On p. 179 of your issue for May 6th "G. A. T. M.," in answer to a correspondent, says that the nave of Winchelsea Church appears never to have been built. Mr. W. D. Cooper in his "History of Winchelsea" gives a plan of the church as originally built, showing a cruciform structure about 200ft. in length, with a nave of four bays. He also remarks that "no traces of the foundation (of the nave) after a very recent (1850) and diligent search can be found, except those of the great central piers and a small portion of the wall at the south-west corner of the south aisle. Near the south-west angle of the church stood until 1790 a campanile or bell tower, when it was removed; the foundations of the nave were also taken up, and the stones used for the repair of Rye Harbour." When visiting the church about four years ago, the sexton told me that in digging graves to the westward of the remaining part of the church he frequently came upon paving tiles similar to those now in the chancel. These facts, I think, prove that "G. A. T. M." was wrong in stating that the nave was never built.—Yours truly,

JOHN PATCHING.

The R.I.B.A. and Architects' Registration.

To the Editor of The Builders' Journal.

London, S.W.

Sir,—This subject has been under consideration in this country for upwards of twenty years, and whilst the general body of the profession have been in favour of the principle of statutory registration, side issues have from time to time been raised that have prevented the attainment of the main object.

Feeling that this was the case, a circular was recently issued only to fully-recognized members of the profession, asking in each case for their individual approval or disapproval of the *principle* of the statutory registration of duly-qualified architects.

The response has been most gratifying to the supporters of the principle. Something like two thirds of the entire profession have responded, numbering thousands; and of these only 168 are against registration, and all the remainder for it. A considerable majority of members of the Royal Institute itself are in favour, and its allied provincial societies almost unanimously so. Of the remainder of the profession, some are too distant to reply in time, others do not take the trouble to reply at all but personally express themselves as being in favour of the movement.

With these facts before me, as one who signed the original circular letter I ventured at the annual meeting of the R.I.B.A. to question the wisdom of the attitude assumed by the Council of this body as expressed in the circular issued by them to the allied societies in the provinces. I was supported in my contention to the extent of being nominated there and then, directly from the meeting, for a seat on the Council so that all provincial and other members might have the opportunity of officially recording their verdict upon the subject *by voting in support of my candidature* if they desire registration and against it if they do not.

It is for the purpose of explaining precisely how matters stand that I issue this circular. I have no quarrel with the Council of the R.I.B.A. nor with any of its members. I recognise that they have a right to their opinions on this or any other question as much as I and those who think with me have a right to ours. And it is only when they give quite a different rendering to what I believe to be the general wish of the profession, and say they do so in their *representative* capacity, that I join issue and place my services at the disposal of my professional confrères so that the question may be fairly tested.

To make the issue quite clear, I beg to announce myself as a strenuous advocate for the statutory registration of properly qualified architects. The details I do not attempt to go into at present, nor is it necessary; but when they have be considered I desire that the Royal Institute shall have the chief place assigned to it in the consideration and promulgation of them.

Upon this issue I ask for the vote and interest in my candidature of every Fellow and Associate who desire to give the subject of registration their active and practical support, and always to bear in mind that sympathy in a certain direction is of no use whatever unless it is backed up by votes.—Yours truly,

SILVANUS TREVAIL, F.R.I.B.A.

MANCHESTER SKIN DISEASES HOSPITAL.

As announced in our last issue Messrs. Thomas Worthington & Sons, of Manchester, have been awarded the first premium in the competition for a new hospital for skin diseases for Manchester and Salford, to replace the wholly inadequate building in Quay Street.

It is estimated that the new buildings will cost about £22,000, which, added to the sum of £13,000 already given for a most eligible site adjoining the existing hospital, brings the total up to £35,000. Towards this promises of donations amounting to £25,000 have been received. The demands upon the hospital accommodation are enormously increasing. At present it is only possible to accommodate six in-patients, and many people have to be included among the out-patients who ought never to leave the doors of the hospital until they are cured. The new building will provide for thirty in-patients. Messrs. Worthington's plans are drawn with a view to a greater part of the buildings—practically a complete hospital—being erected on the vacant site without interference with the hospital work, which, on their completion, can be transferred to the new quarters, the existing buildings being then demolished and the structure completed.

In the new hospital all the administration rooms will be near the main entrance. The patients' entrance will be in Byrom Street, set back in a forecourt, on each side of which a wing of the building will run out to the street line. The arrangement is a most convenient one, inasmuch as it will prevent crowds of patients gathering on the footway and street, and will make their entrance quiet and retired. It is suggested that the building should be faced with Runcorn stone and brick. Decorative features have been introduced on the Quay Street façade and at the ends of the wings facing Byrom Street, but the elevations on the Artillery Street side and facing the vacant land will be treated quite simply. The accommodation will include a set of self-contained chambers for the house surgeon, room for the matron, sitting- and dining-rooms and sleeping accommodation for eight nurses, male and female wards for thirty beds, operating and anæsthetic rooms, laboratory, "light" and Rontgen-ray rooms, dispensary, waiting- and dressing-rooms for out-patients, stores, board-room, offices, and all the necessary administrative apartments. In the wards, which are all on the second floor, 1,200 cub. ft. of space has been allowed for every bed, and special care taken to secure light and the free circulation of air. The sanitary blocks are completely cut off from the wards by cross-ventilated bridges. Heating is to be carried out by means of hot air, hot water and open fires.

THE BUILDING TRADE IN SOUTH AFRICA.

Architects and builders in Johannesburg are busy, and save for scarcity of stock in some lines they report that the condition of the building trade could not be more satisfactory. Architects interviewed all seemed perfectly satisfied, and said that there was now more building going on in Johannesburg than during any other time in its history. This they considered was a most favourable indication for the future, when the present scarcity of money and railway delay in delivering goods were taken into account. Many large schemes, of course, were in abeyance because of the stagnation in share values, and one architect stated that his observation, extending over many years, had proved that the real estate market and building trade depended entirely on the state of the money market, and that the present activity was due principally to the immediate necessity of providing offices and houses, and not to any comprehensive provision for future demands. One point of improvement in dwelling-houses is that the majority of these are now being built of stone and brick, instead of wood, as was formerly the general case. This movement towards solidity evidences a belief in permanence of residence, and therefore a confidence in the future of Johannesburg.

Nearly all large orders in the building trade have been placed, and current trade in consequence is slack. Stocks are ragged, and flooring and ceiling are scarce. Prices, however, have shown no relaxation, and a large increase of trade is anticipated within the next six weeks. Bricks, lime and cement are in good demand, but much dissatisfaction is expressed over the apparently high price of cement.

Prices of Building Materials.

Portland cement, per cask	36s. to 37s.
Lime, per bag	5s. 6d. to 7s.
Bricks,* slop (burnt)	50s. to 55s.
" common	55s. to 60s.
" stock	60s. to 70s.
" facing	£6 10s. to £8
" pressed	£13 to £14 10s.
" unburnt	25s. to 30s.
Deals, 17in. and under	10½d. to 11d.
" 18in. and 19in.	11d. to 11½d.
" 20in. and over	11½d. to 1s.
Oregon logs, 6×6, per cub. ft.	5s.
" 12×12, long lengths, per cub. ft.	5s.
Ceiling	3d.
Flooring	4½d.
Windows, 8×10	32s. 6d.
" 10×12	37s. 6d.
" 15×30	40s. 6d.
" 18×36	50s.
Doors, 2ft. 6in.×6ft. 6in×1¼in.	13s. 6d.
" 2ft. 6in.×6ft. 6in.×1½in.	14s. 6d.
" 2ft 6in.×6ft 8in.×1½in.	16s.
Galvanized iron, 6ft. to 10ft., per ft.,	7½d.
Shelving, 1×12, D 2 s, per ft.	6d.
Clear pine, D 2 s	7d.
Mouldings, O.G., 1¼×1½in.	1¼d.
" " 3in.	3¾d.
Sterling, 4½in.	3d.
" 9in.	5d.
Cornice, 3in.	2d.
" 6in.	4½d.
Architraves, 3in.	2½d.
" 6in.	5½d.
Scotia, 2in.	3¼d.
" 1½in.	2d.
" 1in.	1½d.
Fret-cut fascia, 6in.	1s.
" " 7in.	1s. 1½d.

—(From "The South African Mines, Commerce and Industries," Johannesburg, April 18th, 1903.)

* These prices are for 1,000 at kiln, and delivery to buildings in town 15s. per 1,000 extra.

Keystones.

A Mausoleum at Plevna is being erected to the Russian officers killed during the siege of the town in 1877.

Mr. B. B. Morgan, of the firm of Morgan & Buckingham, of Norwich, has been appointed architect and surveyor to the Norwich Board of Guardians.

A Large Block of Flats in Marylebone Road, W., known as the Manor House, is being erected from designs by Messrs. Gordon & Gunton, of Blomfield Street, E.C. The builder is Mr. Carmichael.

St. Andrews Street Baptist Church, Cambridge, is being remodelled, and to a large extent rebuilt with an entirely new frontage and interior fittings, making use as far as possible of the foundations and side walls of the present building. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, London W.C.

R.I.B.A.—A meeting of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the president, Mr. Aston Webb, occupying the chair. A paper on "The Beginnings of the Egyptian Style of Architecture" was read by Prof. Sir Martin Conway. Owing to the great pressure on our space we are obliged to hold over our report of it till next week.

Some French Memorials.—The statue of Alfred de Musset, which was executed by the sculptor Pierre Granet and refused a place in Paris, is now to be erected at Neuilly, where de Musset spent a great part of his youth. M. Leroux is about to undertake the monument which is to be erected to the memory of René Saint-Just at his birthplace. M. Rodin has completed the model of the monument to be erected to Puvis de Chavannes by his brother workers in art.

Leith Poorhouse Competition.—The Leith Parish Council last week considered the plans for the new poorhouse, with a report by the assessor, Mr. R. D. Sandilands, architect, Glasgow, when it was resolved to award the first premium to design No. 2, by Messrs. Scott and Compbell, architects, Edinburgh. The second premium was awarded to design No. 7, the author of which is Mr. W. C. Laidlaw, architect, Edinburgh.

Competition Reform Committee.—The Committee disapproves of the existing conditions of the competition for a public library at Cubitt Town, Poplar, but is endeavouring to get them revised. Members are requested to abstain from competing unless they receive a further communication to the effect that the conditions have been satisfactorily revised. The reasons of complaint are that there is no professional assessor, and that the Council do not bind themselves to adopt or carry out any of the designs submitted, &c.

The Stratford-on-Avon Cottages.—At a meeting of the O.P. Club held at the Criterion Restaurant on Sunday evening Miss Marie Corelli, after freely insulting Mr. Carnegie, continued to spread her mistaken accounts about the cottages in Henley Street, Stratford, proposed to be demolished. Mr. Bird, the mayor of the town, opportunely points out that the petition signed at the meeting of the Selborne Society on May 5th, when Miss Corelli first made her high-sounding statements, was also signed by members of the archæological societies on the strength of it, but without knowing the real facts. The reconstruction will be made by Mr. Holton, architect, in consultation with Mr. J. A. Cossins as representing the Society for the Protection of Ancient Buildings.

A new Free Library at Kingston-on-Thames has been opened. Mr. Alfred Cox was the architect.

Another "Skyscraper."—It is proposed to erect a seventeen-storey "sky-scraper" on a plot of ground, 26ft. by 40ft., at the corner of New Street and Exchange Place, in the very heart of the Wall Street district, New York. This will be the smallest area on record for the foundation of such a lofty building.

A Rawtenstall Competition.—The Rawtenstall Corporation have appointed Messrs. Butterworth & Duncan, assessors in the competition for a Free Library, Municipal Offices, and Town Hall, which they propose to erect on a site in the centre of the town at a cost of over £30,000, and for the plans of which they propose to offer premiums of £100, £50, and £30.

South Cliff Congregational Church, Lowestoft, was opened last week. The church will consist of nave and double transepts, but the latter are not yet built. The facings are of red bricks and the dressings of white Costessey work. The roofs are of open-timber construction of the hammer-beam type. The contract was let to Mr. John Ashby, "Woodbury," Lowestoft, and amounted to £1,698. The accommodation of the building is about 430 adults. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, London, W.C.

A Cape Town Competition.—Eight sets of designs were submitted in competition for the City of Cape Town Public Baths, to be erected in Caledon Square. The assessor was Mr. F. R. Roberts, architect, Durban. Messrs. MacGillivray & Grant, Cape Town, were awarded first place; Messrs. Sherwood, Pitts & Holland, second place; and Mr. A. Wyatt Papworth, A.R.I.B.A., third. The scheme comprises large swimming baths, first and second class; ladies' and gentlemen's slipper baths, first and second class; Turkish baths for ladies and gentlemen; and the usual laundry and other accessories of such an institution.

The Rural Housing and Sanitation Association held a meeting last week. The Rev. T. C. Fry, who presided, remarked that it was not realized that the question of rural housing was quite as important as the question of urban housing. Mr. Rider Haggard said he had not the slightest doubt that there was an extraordinary lack of cottages in the rural villages, for the reason that such cottages decayed in the course of time and were not rebuilt, and, again, because in the present day people would not live in the houses in which their fathers thought fit to dwell. The only chance to improve the state of things was to persuade the Government to advance money at a reasonable rate of interest, including a sinking fund.

The Church of St. Andrew, Swanwick, has had a new tower added to it on the north side as a memorial to Queen Victoria by Mr. FitzHerbert Wright, High Sheriff of Derbyshire. The tower forms a porch to the north aisle. The upper stages comprise the ringing chamber, clock chamber, and the belfry containing a ring of five very fine bells. The work is late Decorated in style, the material being fine selected Coxbench stone, from the well-known quarry of Messrs. W. H. & J. Slater. The five bells were cast by Messrs. Taylor & Co., of Loughborough. The old church has been cleaned and re-decorated throughout, and the seats varnished, by Mr. G. Potter, of Derby. The architects for the work were Messrs. Naylor & Sale, Iron Gate, Derby. Mr. J. R. Naylor, F.R.I.B.A., was a pupil of the late Sir Gilbert Scott. The contractor is Mr. Alfred Smith, of Gordon Road, Derby. The contract amounts to over £4,000.

Builders' Notes.

The Additions to the St. William's Infectious Hospital, Rochester, has been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their patent Manchester stoves with ornamental tiled sides.

The Fireproof Construction of the Columbian Fireproofing Co., Ltd., 37, King William Street, E.C., has been adopted for the New Lamp Black Works at Greenwich for Messrs. Binney & Smith Company, including the casing the steel girders, and glasso finish to roofs. The architect is Mr. J. Thorman, of Borough Hill, Royal Hill, Greenwich.

Clifford's Inn was last week sold for building purposes to Mr. William Willett, the well-known builder, of Sloane Gardens, for £100,000. A reservation was made that the fourteen surviving members of the Society of Clifford's Inn should retain the seventeenth-century oak panelling and carved and other woodwork, including a handsome mantelpiece, in one of the rooms of the Inn. It is understood that these will be offered to South Kensington Museum.

Change of Address.—The office of the general manager of the Simplex Steel Conduit Co., Ltd., has been removed from 20, Bucklersbury, to larger and more convenient premises at Westinghouse Buildings, Strand, W.C. (1st floor), to which address all communications for his personal attention should be forwarded. The Company's London offices and stores will remain as at present, at Mansion House Chambers, 20, Bucklersbury, E.C.

The Building By-laws Reform Association, which was recently formed to secure that official control of private buildings shall not extend beyond the demands of public health and safety, met last Wednesday at the offices, 45, Parliament Street, Sir William Chance, Bart., in the chair. The Duke of Westminster was elected president. A proposal was made for the appointment of a special committee to consider and report on the amendments required to secure the removal from existing by-laws of those provisions which unreasonably encroach on individual liberty. A long discussion followed in which Mr. W. M. Acworth, Mr. Lacy Ridge, Mr. A. H. Clough, Mr. Mark H. Judge, Mr. W. Henman (Birmingham), Mr. T. M. Shallcross (Liverpool), Mr. Thackeray Turner, Mr. E. D. Till and Mr. R. A. Read, hon. secretary, took part. The special committee was appointed and letters asking for advice for the amendment of by-laws at Guildford, Bucklow and Bradfield were referred to it.

Walsall Carpenters' and Joiners' Dispute as to working rules and increase of wages has been settled. It was submitted to the arbitration of Mr. A. A. Hudson, of the Inner Temple, barrister-at-law. The arbitrator's award provides that the rate of wages is to remain as before, namely, 8½d. per hour. The hours of work from December 1st to 15th inclusive, and from January 16th to 31st inclusive, to be from 7.30 a.m. to 4.30 p.m., with one hour for meals; Saturdays, 7.30 a.m. to 1 p.m., with half an hour for breakfast; from December 16th to January 15th inclusive, to be from 8 a.m. to 4.30 p.m., with half an hour for meals; Saturdays, 8 a.m. to 1 p.m., without allowance for breakfast. The other working hours to remain as before. Overtime made at the request of the employer, after the ordinary hours of work, to be at the rate of time and a quarter for the first two hours and time and a half afterwards; Saturdays, if made at the like request, time and a half after 1 p.m. Other minor alterations have been made in the working rules.

S.K. EXAMINATIONS, 1903.

BUILDING CONSTRUCTION:
Elementary Stage.

[The examination in this subject lasts four hours. You are permitted to answer only seven questions. Questions marked with an asterisk have accompanying diagrams. The value of marks is attached to each question.]

*1. For what purpose is this tool used? Describe how the workman holds it when he uses it for ordinary work. (12)

(*a*) For cutting window-glass to sizes.

(*b*) The workman holds the tool as a pen or pencil is mostly held, between the thumb and the index and middle fingers, with this difference that the stem or stalk of the glazier's diamond passes up between the index and middle fingers.

(NOTE.—This answer is quite enough. The student may be disposed to tell all he knows about glazier's diamonds, as that each diamond must be held in a special and particular way, that the workman knows by the sound of the cut whether he is making a cut or merely scratching the surface, &c. These details are not asked for.)

2. What are meeting rail, muntin, tread, riser, going, lacing course, quirked ogee, coarse stuff, gauged stuff, droved work, rusticated? (Full marks will be given for *nine* correct definitions) (12)

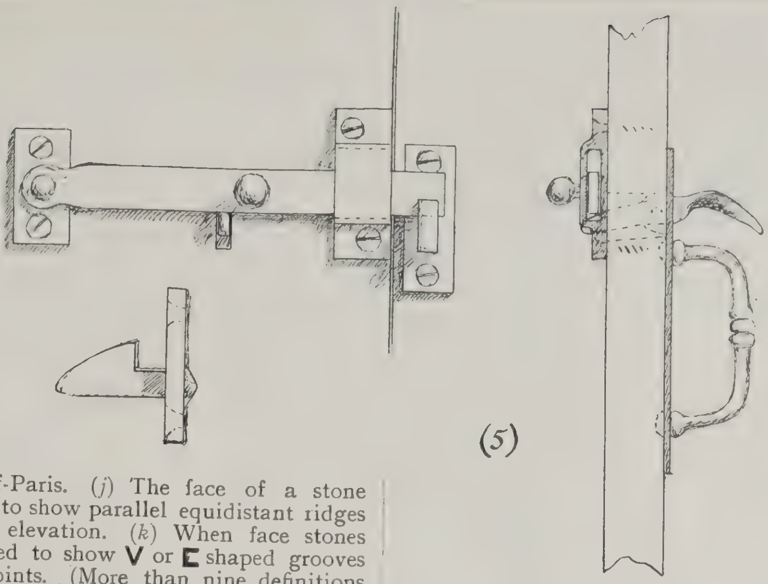
(*a*) In a window of several sashes the rails of two sashes which meet or overlap are meeting rails. (*b*) The central vertical piece of framing of a door. (*c*) The board forming the top surface of a step; the top surface of a step. (*d*) The board forming the vertical face of a step; the vertical face of a step. (*e*) The horizontal distance between two successive risers of stairs. (*f*) A continuous bonding course—as one or more courses of bricks or tiles in rubble of flints or other small-sized stones. (*g*) See sketch. (*h*) Mortar mixed with cowhair suitable for the first and floating coats of plastering. (*i*) Mortar, &c., for which the proportions of constituents are "gauged" or measured; coarse stuff to which a measured quantity of plaster-of-Paris has been added; lime putty to which has been added a proportion of plaster-of-Paris. (*j*) The face of a stone chiselled to show parallel equidistant ridges of slight elevation. (*k*) When face stones are dressed to show **V** or **⊏** shaped grooves at the joints. (More than nine definitions need not be given; if, however, the student is in doubt as to the correctness of some of the nine on which he depends, he is not debarred from writing definitions to all the terms in the question.)

*3. In a certain town electric wires are borne on brackets like that shown; given the weight at A as being 40lbs., assuming that this pressure may be transferred to the point B, where the bracket bears against the slate as shown, and assuming that the directions of the reaction and of the third force are as shown, what is the amount of the reaction in lbs.? (15)

See illustration. This work is a sufficient answer to the question.

*4. Make a tracing, in ink, of this drawing and of the writing and figures. (The Indian ink should be sufficiently thick to give opaque lines suitable for photographic printing; the lines should be well defined, uniform in breadth, having firm unbroken edges, and they should neither stop short of nor go beyond the proper points.) (15)

The terms of the question give sufficient advice. It should be remembered that the white lines on the print are somewhat finer than the black lines of the tracing.



(5)

5. Sketch (approximately) to the scale of $\frac{1}{2}$ a good strong thumb-latch for a door; also the keeper, or catch, to be fastened to the door-frame. Describe what you consider to be important points in a good latch such as you sketch. (12)

See illustration. The corners of the end of the latch should be slightly rounded, and there should be no sharp points or hooks; usually the shank of the thumb-piece projects inside, sharpened and turned down; such projection is not required where the latch has a knob as shown; as such doors often "slam-to," the piece in which the latch slides should be fairly strong, and the keeper should have a gentle slope; the keeper should be strong, so as to withstand a reasonable pressure forcing the closed door inwards.

6. (*a*) What is a bib-cock? (*b*) Describe how a "wiped joint" is made. (12)

(*a*) The illustration shows a beer-tap: bib-cock is generic; it means any cock having a turned-down delivery point. (A drawing is not absolutely necessary for this answer; or the roughest indication might be shown to make the student's answer definite.)

(*b*) The pipe-ends should be neatly trimmed so that there will be no roughness inside the connected pipe at the joint; the ends should be made truly circular; one end should be slightly opened to allow the other end to enter about $\frac{1}{4}$in.; the entering end should be smudged to prevent the solder going into the pipe; the joined pipe should be firmly fixed; the pipes should be shaved clean for the length of the joint and smudged neatly at the limits. Apply the molten solder first at a smudged end to get the pipe heated, and work it neatly with the cloth, adding solder from the ladle as needed, towards the other end, giving the finished joint the proper shape.

7. A rectangular rainwater tank weighs 300 lbs.; it is 6ft. by 4ft., and it is 2ft. 6in. deep (internal dimensions); it is supported with its bottom horizonal; owing to a stoppage of the overflow pipe it is filled with water. (*a*) What is the pressure of the water per sq. ft. on the bottom of the tank? (*b*) What is the weight of the tank and water? (*c*) How many gallons of water does the tank contain? (14)

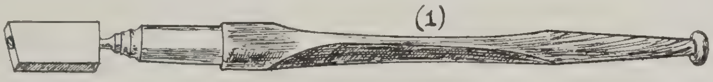
(*a*) $62{\cdot}5 \times 2{\cdot}5 = 156{\cdot}25$; $156{\cdot}25$ lbs. per sq. ft.

(*b*) 6ft. × 4ft. × $2{\cdot}5 = 60$ cub. ft. of water at $62{\cdot}5$ lbs. per ft. $= 3750$ lbs. $3750 + 300 = 4050$. Weight of tank and water = 4,050 lbs.

(*c*) $60 \times 6{\cdot}25 = 375$ gals.

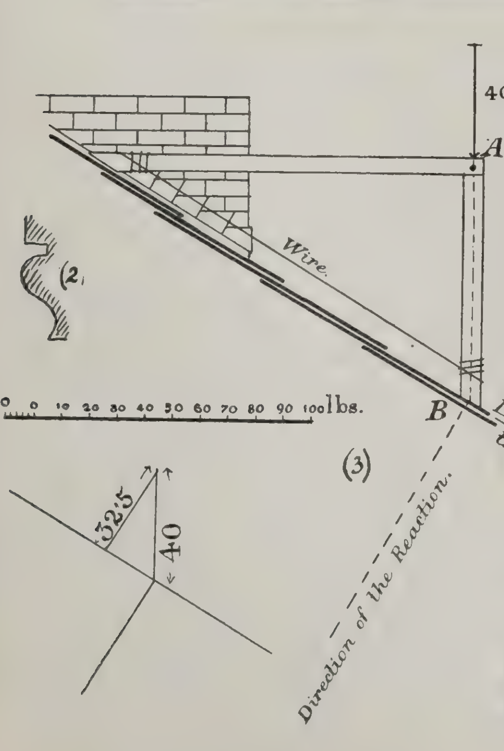
Note—A cub. ft. of water weighs $62{\cdot}5$ lbs.; it also contains $6{\cdot}25$ gals

8. The slates on a roof are 24in. by 12in.; an average slate weighs 7 lbs., the slates are laid with a lap of 4in.; what is the weight



(1)

(2,



40lbs.
A
Wire.
B
10 0 10 20 30 40 50 60 70 80 90 100lbs.

(12)

of slates which cover an average square of roof? (14)

One slate covers 120 sq. in. $\left(\frac{24-4}{2}\times 12\right)$. A square of slating is 14,400 sq. in.; it will be covered by 120 slates at 7 lbs. Weight of slates, 120 × 7 = 840 lbs.

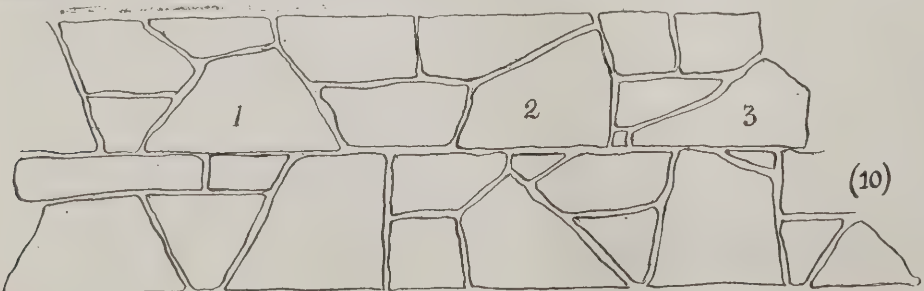
(A question involving the knowledge of the mode in which slates are placed on a roof has been given in every paper for the last three years; the examiners in last year's report are dissatisfied with the answers to the questions; it would appear that essential matters of this kind are insisted upon by the examiners, and students and teachers would do well to read the reports on examinations.)

9. Draw to the scale of $\frac{1}{12}$ the elevation of a casement window (not a *pivoted* sash) 4ft. by 2ft. 6in. (sash size); a single sash in four panes; show reveals and stone sill; sketch, approximately to the scale of $\frac{1}{4}$, the essential details of the hinges and fastener. (14)

See illustration. I put four hinges; the glass should be cut to be close-fitting; I would put brass angle-pieces at the corners (not shown) to assist the mortises and tenons; the reveals are shown by the outside vertical lines. (The drawing, without this explanation, is a sufficient answer.)

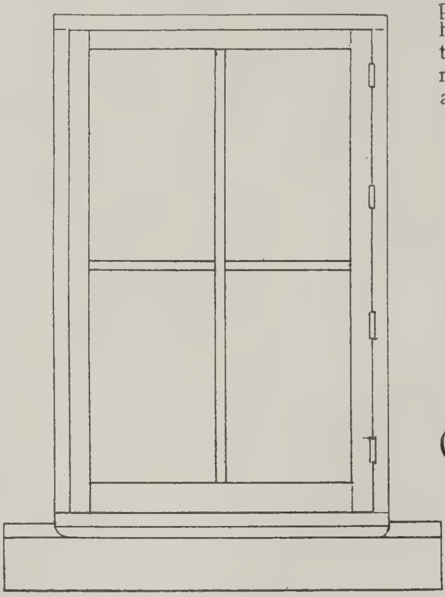
10. Sketch to the scale of $\frac{1}{12}$ the face (elevation) of a completed course of rubble masonry (the course being, say, 15in. deep); sketch on top of this completed course portions of a second course in process of building; explain why the stones shown—of the second course—are placed where you sketch them. How does the mason keep his work truly in line? How does he use his plumb-rule in rock-faced work? (14)

(*a*) See illustration. See note to question 8. (*b*) The stone 1 is placed so as to cover the two upright joints shown; 2 and 3 are also placed as the mason judges best with reference to the joints below; in this way he "breaks joint." (*c*) By straining a line horizontally in the plane of the face of the wall (the line is supported at intervals on stones set in the course to prevent undue "sag" of the line; the line is fastened to these stones by a stout straw or other sufficient slight material doubled to form a loop and attached to the stone by a pat of mortar covered with a spawl). (*d*) The line is set plumb over the "edge" of the course below, using the straight edge of the plumb-rule; the "plumb" of two or three courses may be tried by entering a nail in the edge of the plumb-rule long enough to keep the plumb-rule from touching the "rock"; the head of this nail is placed against a point in the true wall face; and by use of his 2ft. rule the mason keeps the edge higher up at the same distance (the length of the projection of the nail) off the line or off the top edge of a completed course.



(10)

11. A plasterer is laying on the first coat of coarse stuff on lathed work, and you see him driving the trowel at right angles to the direction of the laths. This is wrong. Can you explain why it is wrong? (12)

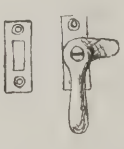


When the plasterer drives his trowel at right angles to the direction of the lathing the edge of the trowel presses, with all the trowel pressure, upon each individual lath; the laths are sprung excessively upwards, with the result that the coarse stuff which passes through between them is torn by the play of the laths and there is no keying. It is not good to drive the trowel in the direction of the lie of the laths; this drags the keying, but this is not an error that a plasterer is likely to commit. The proper direction is at an angle of, roughly, 45 degs.; in this position the trowel edge presses on four or five laths and the stuff leaves the trowel with sufficient freedom.

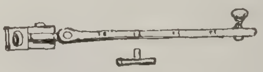
(Any student who is a practical plasterer will be able to answer this question. It is a matter with which a clerk of works should be conversant, and these examinations are intended to promote the education of clerks of works among others. The exercise of a little of the quality of common-sense should enable a student to answer the question; a student should get as much credit as his answer to a question of this kind deserves, even if he does not give the above, which is, I think, the correct answer.)

12. Sketch to the scale of $\frac{1}{8}$ (approximately a fireplace—grate, oven and boiler—suitable for the kitchen or living-room of an artizan's cottage; explain the setting and flues. (14)

See sketch. (A student could not be expected to put in as many details as I show in my sketch, because for that I have the advantage of a catalogue illustration before me; but his sketch should show the examiner that he had intelligently noticed some simple form of kitchen range suitable for a workman's cottage.) This range costs less than 50s.; it has an L boiler, it is arranged so that the heat of the fire gets underneath and around the boiler, by the boiler being set clear of the brickwork all round, and circulation of hot air and gases is promoted by the three openings shown on the plate at the inner end of the boiler. There is not a flue to the oven in the usual sense, but the oven is set leaving everywhere $1\frac{1}{2}$in. clearance from the brickwork, and it has two heavy projecting pieces reaching into the fire which heat and conduct their heat to the side of the oven. There are no range flues to this range except the three openings noticed above.

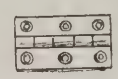


Brass Fastener.



Brass Stay

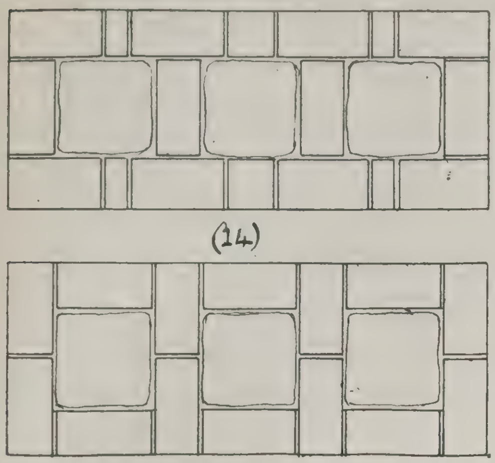
(9)



Brass Butts.

13. Describe how you would prepare (from materials in the usual commercial conditions) a pot of light-coloured paint for fourth coating, inside work; give a name to the shade of colour you produce. (12)

I assume that I have white-lead ground in oil and raw Turkey umber, also ground in oil. I assume that the three coats already given to the work have been such that the third coat "bears"—that is, there are no flat or dead spots—and that the third coat is very nearly of the intended finished shade. Because I wish the finished work to retain its colour and not grow yellower in shade, the oil I use for thinning will be raw linseed oil; the work is not sufficiently well brought up for flatting, so I do not make the paint flatting stuff, but I use enough turpentine to make it somewhat of that character. Notwithstanding the abuse of "patent driers" in the books, they are very commonly used, and I shall use them. Mix as much colour as will coat all the work to be done, because it gives some trouble to exactly match a



shade. Stir up the white lead with the oil in a paint-pot, add a sufficient quantity of driers, add as much Turkey umber as will give the desired tint; strain through muslin into a second paint-pot, working the stuff through the muslin with a paint brush; thin with turpentine. I call the shade drab.

14. Draw plans of two successive courses of a half-brick built chimney-stack of three flues (scale $\frac{1}{12}$); show mortar joints as double lines; show pargetting. (12)

See illustration. (It is not necessary to write the word "pargetting.")

Obituary.

Mr. Alban Cole, of Tuffley, late of the Rea Farm, Quedgeley, died last week at the age of seventy-one years. The deceased was formerly manager of Messrs. Eassie & Co's joinery department, and on the transfer of that business to the Gloucester Railway Carriage and Wagon Co., Limited, he acquired the New Inn, Tuffley.

Electrical Notes.

The Birmingham Tramways are to be municipalized.

The Central Tower of the Administration Building at the St. Louis Exposition will be illuminated with 6,000 incandescent lamps. The current for this will be drawn from the power plant on the University portion of the grounds.

The New Electric Railway in Liverpool.—The result of the first week's working of the Mersey Railway, which runs a three-minutes' service by electricity and has superseded steam traction, shows an increase of 37,000 passengers compared with the previous week and 45 per cent. increased income, and 40 per cent. in excess of the corresponding week last year.

Scottish Central Electrical Power Bill.—The County Council of Stirling intends to oppose this Bill, and the Law and Parliamentary Committee has been instructed to endeavour to secure the co-operation of the counties of Linlithgow and Clackmannan, and any burghs which might desire to be associated in the opposition. The Council does not oppose the Bill as a whole, but protests against certain clauses.

Reduced Charges for Current at Birmingham.—The Electric Lighting Committee of the Birmingham Corporation has recommended the following reduced scale of charges:—Lighting: for the first 300 units per quarter, from 7d. to 6d. per unit; beyond, from 4½ to 4d. For power and day-load lighting: the first 300 units per quarter, 3d. per unit as against 4d. for the first 100 units; up to 3,000 units, 2d., and beyond, 1½d., against 2d. per unit over 100 units. Meter charges have also been reduced to 2s. 6d. per quarter up to 5 ampères, 3s. up to 25, and 5s. up to 100.

Nottingham Tramways.—During the twelve months ended March 31st the Nottingham Corporation electric tramways carried 24,534,630 passengers, and the total receipts amounted to £115,149. The undertaking represents a capital expenditure of over half a million sterling.

Kingston Street Lighting.—The extension of street lighting at Kingston-on-Thames with "Gilbert" 6ft. carbon arc lamps of a similar pattern to those used on the Thames Embankment has just been completed, and the river front, Kingston Hill, and several other parts of the town are now lighted by these lamps, which are run at 1,100 volts (direct current), and burn nearly seventy hours without re-trimming. A novel feature of the new installation is the Gilbert patent switch, by means of which incandescent lamps are automatically switched on and off as required by means of the arc-lamp circuit.

The New L.C.C. Trams on the new electric tramways between Tooting and Westminster and Blackfriars bridges, opened last Friday, carry 66 passengers—28 inside and 38 outside. They are supported on bogie trucks of the maximum traction pattern, and each car is driven by two electric motors of 35 h.p. each. All the cars are painted a uniform chocolate colour. Along each side run seats of light pierced wood, and in the middle of the car there is a sort of low partition. The seats on top are of the "garden" type with reversible back rests. The "conduit" system has been adopted. Whether the Council was right in this decision has been, and still is, the subject of keen controversy. The trolley is cheaper by £12,000 per street mile or more; it can be put up more rapidly; and it does not involve such extensive interference with the road surface and the traffic while under construction or repair, nor does it require the use of the third rail, with its open slot, or elaborate and expensive cleaning. On the other hand, the conduit gets rid of unsightly posts and cables. The current is supplied, for the present, from a temporary generating station at Loughborough, pending the completion of the main station at Greenwich, which will be one of the largest in the kingdom, with plant working up to about 40,000 horse-power. There are sub-stations at Clapham, Brixton Road and the Elephant and Castle, where rotary transformers reduce the current from 6,600 volts to 550 volts, at which power it is transmitted to the distributory cables. A double track of 4ft. 8½in. gauge is employed; the opening between the slot rails is ¾in. wide. The conductors carrying the electric current are **T**-shaped rails of soft steel with specially high conductivity, carried within a concrete conduit by insulated supports. According to a statement issued by the Council it appears that the inclusive cost may be put down at about £440,000, or about £26,800 per mile. The whole of the electrical installation of the tramways has been designed by and carried out under the general supervision of Dr. Kennedy. A portion of the electrical work, including the arrangement of the temporary generating station and sub-stations, as well as the laying of the electrical mains and their connection with the sub-stations, has been carried out by Mr. J. H. Rider, the Council's electrical engineer, under the supervision of Mr. A. Baker, the tramways manager, who has control of the working of the tramways and also advises the Council in all questions relative to tramways in London. The contractors for the road work, excavation and platelaying were Messrs. J. G. White & Co., of College Hill, Cannon Street, E.C.

New Companies.

Le Touquet Syndicate, Ltd., contractors, 30 and 31, St. Swithin's Lane, E.C. Capital: £50,000 in £1 shares.

Whyte & Co., Ltd., railway contractors, builders, &c., 1, Church Court, Clement's Lane, E.C. Capital: £10,000 in £1 shares.

Wood Lane Brick Co., Ltd., manufacturers of cement, terra-cotta bricks, tiles, pipes, &c. Capital: £3,000 in £10 shares.

Spiralitic Joint Co., Ltd., manufacturers of drain pipes, tiles, &c. Capital: £100 in £1 shares.

Whatley & Co., Ltd., auctioneers, estate agents, &c., surveyors, architects, &c. Capital: £10,000 in £1 shares

Millennium Light Syndicate, Ltd., makers of apparatus, &c., for intensifying the illuminating or heating properties of gas, gas manufacturers, &c., Milton House, Surrey Street, Thames Embankment, W.C. Capital: £200 in 1s. shares.

Vacant Appointments.

[The dates given are those on which the application is to be sent in, and the name given is that of the person to apply to. In nearly every case the application has to be made on a special form, which can be obtained from the officials mentioned.]

May 20.

Rugby U.D.C.—Superintendent for the laying of cables; state salary. Mr. Wratislaw, clerk.

May 21.

Chester R.D.C.—Clerk of works, £3 per week. W. Turncock, clerk.

May 22.

Hampton-on-Thames U.D.C.—Clerk of works, £3 3s. per week. Sidney H. Chambers, clerk.

May 23.

Wirral R.D.C.—Clerk of works, £3 per week. Frank E. Priest, 13, Harrington Street, Liverpool.

Walton-upon-Thames U.D.C.—Surveyor, salary £250. Percy H. Webb, clerk.

May 25.

Calcutta Corporation.—Engineer, salary Rs. 2,500, rising Rs. 3,000 per month. R. B. Buckley, Esq., C.S.I., 47, Clanricarde Gardens, London, W.C.

May 26.

Mirfield U.D.C.—Surveyor, £15[illegible]. E. B. Wilson, solicitor, Mirfield.

Tamworth Union.—Clerk of works at new infirmary; state wages. I. H. Dewes, clerk.

May 27.

Dawlish U.D.C.—Waterworks inspector, 30s. per week. R. C. Clarke, C.E.

June 2.

Gibraltar.—Civil engineer, £200, rising. W. W. Copland, engineer, Gibraltar.

Sanitary Commissioners of Gibraltar.—Assistant civil engineer, £120, rising. W. W. Copland, secretary, Sanitary Commissioners Offices, Gibraltar.

June 5.

Skegness.—Gas manager. £110. Tweek, Stephen & Dushper. solicitors, Skegness.

June 6.

West Ham Corporation.—Demonstrator and assistant lecturer in mechanical engineering, £120. Fred. E. Hillery, town clerk.

At once.

Blackpool Tramways Co.—Electrical foreman; state salary. Chairman, 30, Birley Street, Blackpool.

Glasgow Fire Salvage Corps.—Chief officer, £300, house, coals and gas. Chairman, Fire Offices Committee, 63, Watling Street, London, E.C.

Coming Events.

Wednesday, May 20.

Chemical Society.—Ordinary meeting at 5.30 p.m.

Thursday, May 21.

Glasgow Architectural Association.—Annual Excursion to Falkland Palace.

Society for the Encouragement of the Fine Arts.—Mr. Arthur Diosy, F.R.G.S., on "Our Allies in the Far East."

London Master Builders' Association.—Council Meeting at 4 p.m.

Society of Architects.—Mr. Silvanus Trevail, F.R.I.B.A., president, on "Impressions of Architectural Rambles on the Continent," 8 p.m.

Home Arts and Industries Association.—Exhibition at Royal Albert Hall at 2.30 to 7 p.m. Open until May 25th.

Saturday, May 23.

British Institute of Certified Carpenters.—Visit to the New Gaiety Theatre, Strand, W.C., at 3 p.m.

Society of Architects.—Field Day at Rochester under leadership of Mr. George Payne, F.S.A. Train leaves Victoria Station at 9.30 a.m.

Monday, May 25.

Surveyors' Institution.—Annual General Meeting. Election of officers and presentation of prizes, 2 p.m.

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, 9, *East Harding Street, E.C.*

Aberbeeg (Wales).—For the erection of twenty cottages at Aberbeeg, for the Aberbeeg No. 2 Building Club. Mr. G. C. Hillard, architect, Market Chambers, Abertillery:—

D. Lewis, Aberbeeg	£4,500
C. Sara, Cardiff	3,710
D. Powell,* Abertillery	3,680

* Accepted.

Acton, W.—For the erection of the Central Schools for the School Board for Acton. Messrs. Edward Monson & Sons, architects to the Board, Acton Vale, W., and 22, Buckingham Street, Adelphi, W.C. Quantities by F. T. W. Miller, of Dartmouth Street, Queen Anne's Gate, S.W.:—

Barker & Co., Kensington, W.	£31,500
B. E. Nightingale, Albert Embankment, S.E.	29,300
Hunt & Son, High Wycombe	28,967
Godson & Sons, Kilburn Lane, W.	28,846
Wall & Co., Kentish Town, N.W.	28,647
Kellett & Sons Willesden Junction, N.W.	28,100
Patman & Fotheringham, Theobalds Road, W.C.	28,000
Lole & Lightfoot, Chelsea, S.W.	27,957
Dorey & Co., Brentford, W.	27,300
Architects' Estimate	27,150
Braid, Pater & Co., Cheapside, E.C.	27,000
W. Wallis, Balham, S.W.	26,999
Dearing & Son, Halliford Street, W.	26,973
H. Lovatt, West Kensington, W.	26,750
T. Gough & Co., Hendon, N.W.	26,734
W. Blackburn, Chiswick, W.	26,650
W. J. Renshaw, Putney, S.W.	26,296
Galbraith Brothers, Camberwell Green, S.E.	26,295
Hadley & Sons, Old Hill, Staffs	26,000
Willcock & Co. Wolverhampton	25,685

* Accepted subject to the approval of the Board of Education.

Barry (Glamorganshire).—For the erection of a new branch reading-room at Porthkerry Road, Barry, Glam., for the Urban District Council. Messrs. Speir & Beavan, architects, Weston-super-Mare:—

A. Richards	£1,290
H. S. Rendall	1,208
Wooton & Son	1,160
H. Fisher	1,150
A. Hooper	1,145
Gibby & Cleak	1,140
S. Martyn*	1,035

* Accepted. [All of Barry.]

Beckenham, Kent.—Accepted for the erection of "Inglehurst" Messrs George Baines, F.R.I.B.A., and R. Palmer Baines, architects, 5, Clement's Inn, Strand, London, W.C.:—

Messrs. H. Copeland & Son, Beckenham	£1,726	10	6

Bowerham.—For the erection of an hotel at Bowerham, for Mr. William Mitchell. Messrs. Harrison, Hall & Moore, architects, &c., Church Street, Lancaster:—

Masons.			
W. Mashiter	£2,150	0	0
T. Kitchen	2,122	1	7
R. L. Dilworth	2,107	16	0
J. Thoms & Sons	1,966	18	4
R. Thompson	1,850	0	0
T. Mawson & Son	1,778	12	6
Exors. of W. Harrison*	1,768	0	0
Joiners.			
Wright & Sons	606	10	0
W. Knowles	584	0	0
W. Parkinson	569	17	6
W. Huntington & Sons	550	0	0
W. Richardson's Exors.	541	3	9
A. Vipond	530	0	0
J. H. Brear, Morecambe	491	16	7
Shaw & Son*	490	0	0
Slaters and plasterers.			
R. Hall & Son	£313	15	9
T. Cross & Sons*	299	5	0
J. Liver	232	11	11
Plumbers.			
Calvert & Heald	£350	0	0
J. B. Kitchen	349	1	2
J. Taylor	343	11	6
Harrison & Moser	341	17	4
W. Abbott	319	0	0
C. H. Whittle	318	0	0
H. P. Calvert	313	0	0
Rushton & Pinch	308	0	0
R. P. Wilson*	305	0	0
Painters.			
J. Taylor	£54	8	0
H. Warbrick	50	15	6
E. C. Parr*	49	15	11

* Accepted. [Rest of Lancaster.]

Bristol.—For builders' and plumbers' work connected with the enlargement of Chester Park Schools, Fishponds, for the Bristol School Board:—

Builder.		
G. Daltry	£4,991	
E. Walters	4,060	
S. Williams	3,905	
H. A. Forse	3,901	
J. E. B. James	3,760	
R. Wilkins & Sons	3,649	
A. J. Bloven	3,490	
E. Clarke	3,440	
E. Love	3,419	
C. A. Hayes	£3,387	
G. Humphreys	3,259	
J. Browning*	3,200	
Plumber.		
A. W. Hawley	£363	0
Slade & Bridgman	365	0
A. S. Scull	3 5	10
S. H. Pavey	319	0

A. E. Wilkins	318	0
G. F. Tuckey	309	0
J. Wilkins & Sons	305	0
A. & J. Tutcher*	302	10

* Accepted. [All of Bristol.]

Cardiff.—For the erection of new shop premises in Cowbridge Road, Canton, Cardiff, for Mr. Thomas Edwards, draper. Messrs. Veall & Sant, architects, Cardiff:—

G. Couzens & Co.	£1,300
F. Small	1,295
J. Allan	1,289
Melhuish Brothers	1,279
Tucker Brothers	1,276
S. Shepton & Son	1,275
J. Haines	1,250
W. T. Morgan	1,235
Blacker Brothers	1,230
W. Symonds & Co	1,200
A. W. Cadwallader	1,170
Knox & Wells*	1,123

* Accepted. [All of Cardiff.]

Clacton.—For the erection of new board schools in Holland Road:—

Dupont & Co.	£7,120	0
J. T. Ward, Colchester	7,100	0
H. Everett & Son, Colchester	7,000	0
S. F. Halliday, Stamford	6,967	10
H. W. Gladwell, Walton-on-Naze	6,875	7
Hammond & Son, Romford	6,813	0
H. Potter, Chelmsford	6,725	0
F. & E. Davey, Ltd., Southend	6,617	0
H. Smith, Clacton	6,565	0
E. West, Chelmsford	6,463	0
Ellis & Turner, Clacton	6,460	0
Myall & Upson, Clacton	6,400	0
J. McKay*	6,300	0

* Accepted.

Corsham (Wilts).—For the erection of new Wesleyan Church and heating chamber. Plans and quantities by Mr. W. H. Bromley, surveyor, Corsham:—

J. Smith	£1,911	0	0
J. Carter	1,865	0	0
Muritt & Son	1,805	0	0
Bigwood & Co.	1,605	0	0
E. Linzey	1,577	16	6
G. Moore,* Trowbridge	1,504	9	0
[Heating apparatus.]			
Haden & Sons, Trowbridge	38	15	0

* Accepted.

Hampton (Middlesex).—For the erection of isolation hospital, Uxbridge Road, Hampton Hill, for the Urban District Council. Mr. S. H. Chambers, senior, architect, Public Offices, Hampton:—

J. Casse	£4,124
Spiers & Sons	3,700
Barker & Co., Ltd.	3,389
E. Chamberlain,* Addlestone, Surrey	3,3 6

* Accepted.

London, S.W.—For electric lighting and bells for the new Chelsea Dispensary, Manor Street, S.W. Messrs. Sheppard & Burkinshaw, architects:—

Messrs. Wells	£53	10	0
Lewin & Co.	52	12	0
Mr. W. Seymour	49	17	6
Messrs. Taylor	46	10	11

* Accepted.

London, W.—For re-building 91, Great Titchfield Street, W., for Mr. H. J. Bale. Mr. William Pywell, A.R.I.B.A., architect, Cumberland House, Hanwell. Quantities by Mr. Max Clarke:—

R. D. Lown & Son	£3,773
E. Lawrance & Sons	3,486
J. Carmichael	3,400
W. G. Minter	3,357
T. H. Kingerlee & Sons	3,227
W. Whitehead	3,065
B. E. Nightingale	3,025
Walter Wallis*	2,999

* Accepted.

London, S E.—For the erection of public baths and washhouses, Old Kent Road, for the Borough of Camberwell. Mr. E. Harding Payne, A.R.I.B.A., architect, 11, John Street, Bedford Row, W.C. Quantities by Mr. R. C. Gleed:—

	Baths and Wash-houses.	Extra for Portland stone.
W. Lawrence & Son, Waltham Cross	£48,300	£2,800
Balaam Brothers, Camberwell	45,000	1,100
B. Nightingale, Lambeth	44,500	2,200
Shelbourne & Co., E.C.	42, 10	1,723

BUILDER'S CLERK wanted immediately in Midlands, well up in Estimating, Correspondence, Prime Costs, and general office routine.—Apply stating age, wages, and experience, and when disengaged, Box 2452, BUILDERS' JOURNAL Office, 9, East Harding Street, E.C.

CLERK OF WORKS REQUIRED upon Asylum Extensions at Bodmin. Must have had good experience in Asylum Work. Reply by post only, to SILVANUS TREVAIL, Architect, Palace Chambers, Westminster.

GENERAL FOREMAN WANTED at once, used to the construction of filter-beds and heavy concrete work, for contract near Woking.—Apply by letter only, giving experience, &c., to L. WHITEHEAD & Co., Ltd., Portland Place, Clapham Rd., London, S.W.

YOUTH WANTED in Architect and Surveyor's Office. One with some knowledge of tracing and squaring dimensions preferred.—Apply, 147-9, Palmerston House, Old Broad Street.

Miscellaneous.

ALL SEEKING APPOINTMENTS.—Poor Law, County Council, Educational, Municipal and other Public Bodies, should send for Classified List of Vacancies throughout the Kingdom.—"THE PRESS" AGENCY, 155, Duke Street, Liverpool.

ARCHITECTS' Working Drawings, Details, Perspectives, &c., skilfully prepared in Black and White or Colour from rough notes, sketches, &c., also tracings. Reasonable Terms.—DRAUGHTSMAN, 121, Rochester Avenue, Rochester.

COTTAGES, BUNGALOWS, VILLAS.—WORKING DRAWINGS in Sets of Six, for 10s. 6d. per set.—The Midland Counties' Designing and Drawing Office, 27, Ethel Street, Northampton. E. JONES, Manager.

MORTGAGE SECURITIES WANTED from £1,000 to £25,000 for large fund immediately available for advances.—Apply W. P. NEAL, Esq., Pinner's Hall, Great Winchester Street, London, E.C.

NOTICE TO BUILDERS, CONTRACTORS, AND OTHERS. We are open to supply Ladders, Barrows, Steps, Trestles, &c., of the best make (as supplied to many Councils), at Lowest Prices. Send for Illustrated List.—CAYLESS' LADDER WORKS, 306a and 342, Fulham Road, London.

QUANTITY SURVEYOR of wide and varied experience is prepared to arrange with Architects for the preparation of Bills of Quantities on mutual terms. Time and accuracy guaranteed.—Box 2340, BUILDERS' JOURNAL Office, 9, East Harding Street, Fetter Lane, E.C.

R.I.B.A., Society of Architects, and Civil Service Technical Examinations. Preparations by correspondence. Twenty-two first places.—G. A. T. MIDDLETON, 19, Craven Street, W.C.

R.I.B.A. EXAMS.—Personal and Correspondence tuition; courses of any duration. Apply for syllabus to Mr. A. G. BOND, B.A.Oxon., A.R.I.B.A., 115, Gower Street, London, W.C. (late Howgate and Bond).

TO ARCHITECTS, BUILDERS, AND OTHERS.—Plans prepared at lowest charges; Tracings from 5s. Specifications, &c., accurately typewritten, 1s. per 1,000 words.—D. R. MATHISON, 39A, Algernon Road, Hendon.

Miscellaneous Articles for Sale.

TO BUILDERS.—Write us for particulars of WOOD-BLOCK FLOORING. Builders' own Wood Blocks laid in our Special Composition. Repairs.—LUDLOW & BOURKE, No. 84, Shernhall Street, Walthamstow.

The Publisher of the "Architectural Review" offers for Sale the remaining **SETS** of

PICTURES

OF

OLD LONDON,

(reproduced by the Rembrandt Process)

DRAWN

By F. L. EMANUEL.

A great many of the places illustrated have already been demolished, and as the plates are destroyed, the Pictures are absolutely unique. NO FURTHER COPIES CAN BE PUBLISHED.

Single Copies at the following Prices :—

1. **The "Old Horse and Groom,"** Back of Holborn - above - Bar (since demolished).	6d. each.
2. **Holywell Street,** from St. Clement Dane's Church (since demolished).	2s. 6d. each.
3. **The "Old Bell,"** Holborn (since demolished).	1s. 6d. each.
4. **Leather Lane,** Holborn.	1s. 0d. each.
5. **Davies Street** (since demolished).	9d. each.
6. **Fetter Lane,** View from Holborn.	6d. each.
7. **King Street,** Westminster (since demolished).	1s. 6d. each.
8. **Staple Inn,** Holborn.	2s. 6d. each.
9. **Milford Lane,** Strand, and Booksellers' Row, looking West (since demolished).	6d. each.
10. **Lincoln's Inn Fields.**	1s. 6d. each.
11. **Archway,** Portugal Street, Lincoln's Inn Fields.	9d. each.
12. **Old Houses in Strand.**	6d. each.
13. **Exchange Court,** Strand.	6d. each.
14. **Foubert's Place,** Regent Street.	2s. 6d. each.
15. **Rupert Street, W.**	9d. each.
16. **Wych Street,** Strand (since demolished).	3s. 6d. each.
17. **Booksellers' Row,** looking East (since demolished).	2s. 6d. each.
18. **George Court,** Strand.	4d. each.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

May 27, 1903. Vol. 17, No. 433. 9, East Harding Street, E.C.

Some Opinions about Liverpool Cathedral. OUTSIDE opinions on architectural matters are often interesting, sometimes valuable. The following, expressing three totally different aspects of the Liverpool Cathedral question, will be read with considerable interest. "Truth" says:—Architects of position are not likely to trouble themselves further with the work of a Committee of dunderhead amateurs which proceeds in so eccentric and skimble-skamble a fashion. The building of Liverpool Cathedral is, *a priori*, a hideous waste of money, and the egregious Committee need not be so feverishly anxious to provide for a large congregation, considering the notorious fact that not a church in the city is ever more than half full, and most of them are nearly empty at all the services. "The Globe" says:—The result of the competition . . is, to say the least, extremely disappointing. . . Liverpool is, therefore, as far as ever from obtaining a cathedral which will do it credit; and if the purely utilitarian ideas of the Committee are to determine the character of the building which will ultimately be erected, there seems little hope of escaping an artistic disaster. "The Tablet" says:—This very suggestion that the pulpit is the most important feature of a cathedral reminds us that Liverpool retains its reputation as a city of stalwart Protestantism. When we go on to add that Mr. Giles Gilbert Scott is a Catholic, perhaps a further clue may be supplied as to the attitude of some of the people of Liverpool towards his design . . . When Mr. Coventry Patmore built the Church of Our Lady Star of the Sea at Hastings he employed a Protestant architect of great repute, Mr. Basil Champneys; and Liverpool may be further reminded of a local instance of Catholic tolerance—the entrusting of the erection of a Catholic church at Lancaster to a Protestant, Mr. Paley. One thing is obvious. If a Catholic is to be debarred from employment in the building of a Protestant cathedral, the invitation to competitors should notify this restriction. It should be frankly stated at the outset that no Catholics need apply.—Mr. W. E. Willink, the well-known Liverpool architect, says:—No one, I think, ventures to deny that this design (Mr. Scott's) is one which shows very exceptional skill and originality; above all, a dignity and largeness of purpose suited to such a monumental work as we desire to possess. But the chief point to remember is not the intrinsic merit of the design, but that in a competition open to the whole world one competitor has been placed by assessors, whose weight no one can be bold enough to deny, far above all the rest, and that this man is entitled in all fairness to reap the reward for which he was encouraged to work. The reason given for the rejection of the design appears, if I may say so with great respect, to be inadequate. In the first place, competitors were not instructed to provide a building in which 3,000 people could hear, but one in which they could see the preacher; and this is, without dispute, accomplished. In the second place, the range of a preacher's voice, if hearing be taken as the criterion, can only be ascertained in a completed building, and it might well happen that all who could see could also hear. . . .

Whitewashing. MR. ARTHUR SYMONS, we notice, suggests whitewashing the interior of "the only beautiful modern building in London"—Westminster Cathedral: of course, only till the marble lining is ready and the mosaics are spread over the walls above. Mr. Symons understands that nothing is likely to be done in the nave and transepts for a year or so: so why not, he says, whitewash them, not too glaring a white? "It must be remembered that this is not a Gothic building, in which darkness counts for so much in the scheme of the architecture, but a building after the Byzantine pattern, in which every inch of space is to be coloured, and in which the architect has worked in a kind of co-operation with light. To leave the bricks as they are at present left is to obscure the whole beauty of the interior for one knows not how many years, until the decoration is completely finished. A temporary coating of lime would not only cover an annoying imperfection, but would send the whole church upwards and outwards into an actual and spacious beauty of its own." There is certainly no practical reason why the suggestion should not be carried out: but the tint would need to be far more subdued than "not too glaring a white," else we should have just as much a surfeit of light as there may now be a lack of it caused by the rough yellow stocks—why call them "hideous yellow bricks"?—"which absorb the light as a sponge absorbs water." Latterly there has been a good deal of comment about whitewashing—though of another kind: but we can hardly suppose Mr. Symon's suggestion to be other than favourably received.

A Professional Matter. A POINT of considerable interest to architects has arisen in connection with the erection of a new asylum for the London County Council. Mr. G. T. Hine, the well-known architect who planned the Horton Asylum, agreed with the Asylums Committee to undertake the design of a replica which is estimated to cost £400,000. He stipulated a fee of £10,000, and £3,000 extra for the quantity surveyors. In view of the usual percentage on such buildings, that was a reasonable demand. The Council, however, thought otherwise, and suggested he should undertake the work at £7,000; or, in other words, that he should bear the cost of the quantities. We have already insisted that quantities are taken out for the benefit of the client, who is consequently the proper person to pay for them; so far as the architect himself is concerned, the building could be erected from the drawings and specifications; priced quantities are solely to secure close tendering, which is of course all in the interest of the client. We are therefore glad to see that Mr. Hine has refused the Council's proposal, and that the Royal Institute has supported him in the matter; more especially as he received only £6,500 for the Horton Asylum and thereby suffered a loss. Mr. Hine explains that he cannot regard the Council's action as due to feelings personal to himself, but that it was either intended as an attack on professional charges or that it arose from a misconception of the facts of the case. In the former event, he adds, "I feel it a duty to my profession to resist it, and this consideration has influenced me as much as other more personal ones in declining your Committee's offer." In face of this the Committee reiterate that they think £10,000 is a reasonable fee. They add: "It may not have been appreciated that on account of the variation of levels it will be necessary to re-model to some extent a number of the working drawings, and that the whole of them will have to be re-drawn in order to obtain the several sets required for the proper execution of the work. We think that for a repetition of the Horton Asylum Mr. Hine should be the architect. If he is not appointed it will be necessary to obtain fresh designs from some other architect, which would involve many months' delay and in all probability entail much additional cost. We are, therefore, constrained to ask the Council to reconsider its decision in reducing the proposed fee to Mr. Hine."

THE COMPETITION FOR LIVERPOOL CATHEDRAL.

We think the good people of Liverpool who organize architectural competitions must be sadly in need of some little instruction in the ethics of such matters. As mentioned in our last issue, the Executive Committee have decided to ignore their advisory architects' report, and to reject the whole of the five designs submitted for the Cathedral. Now this makes the third large competition in Liverpool where similar courses have been taken, and, in view of the forthcoming Liverpool Cotton Exchange competition, it seems advisable to explain to all whom it may concern why architects are sometimes willing to enter for a competition where the stakes are quite incommensurate with the value of the labour involved.

From the views expressed to us by several Liverpool persons of prominence in the commercial world, it seems to be erroneously thought that upon the payment of the promised premiums competing architects have nothing more to say or to complain about. But this is not so, as a very little reflection would make apparent. It must be obvious that it would not be worth the while of any leading architect to enter a competition for the price of the premiums, even were anyone of these assured to him; but he might, and does, enter in the hope of his design being carried out. The actual preparation of the drawings which serve to convey his thoughts and ideas to the minds of others frequently costs more than the amount of the premium, which is invariably out of all proportion less than the proper scaled charges for such work. As an example, in the Liverpool Cathedral competition the premium is £300 for each competitor, whilst the ordinary scale charge would amount to £12,500 for each competitor, even assuming that the cost of his design did not exceed £500,000.

Apparently it cannot be too often explained that an architect's work is not, like cotton or sugar, to be considered as so much merchandize, to be bought at the price of producing so many drawings; for it is the knowing what to do and how to do it, the ideas of the architect and his skill in carrying them out, for which payment should be made; and this is not met by a mere premium any more than would a doctor's or a lawyer's services be valued at the price of a few bottles of medicine or some manuscripts.

We would also point out to our Liverpool friends that when an architectural assessor is appointed to advise in regard to a competition, this is regarded by architects as a guarantee of the good faith of the building committee and that there will be a knowledgeable adjudication upon the designs submitted. But the Liverpool practice, in effect, induces architects who would otherwise not compete to enter a competition, and then leaves the building committee free to act as though no skilled assessor had been appointed. In the three cases at Liverpool, we would pertinently ask why the respective building committees held a competition if they already knew what they required and intended to have; and if they only knew what to do and how to do it after the competition designs had been received and examined, then, are they justified in throwing over all the competitors whose united designs had been so instructive to them, and in employing an outsider to carry out ideas of which they were not previously in possession, and without adequately paying for them, as in the case of the recent Liverpool Corporation Baths competition?

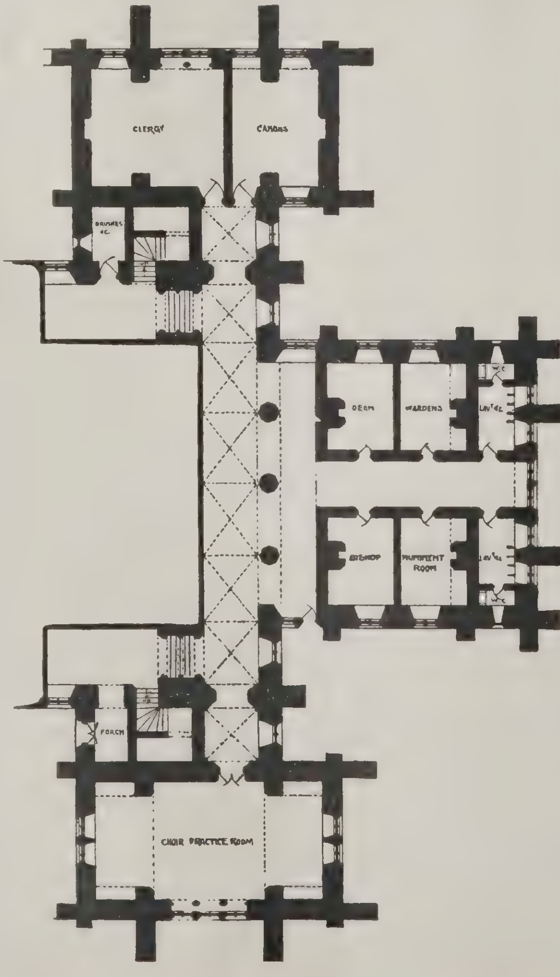
The Liverpool Cathedral competition has been, from its initiation, about as unsatisfactory as it possibly could be, but it may have served a useful purpose if it should offer a wholesome warning to architects and prove a check to the growth of practices in the conduct of architectural competitions which cannot be too strongly condemned.

To refer to the five designs submitted in the Liverpool Cathedral competition, these are, we believe, by the following authors:—

No. 1. Mr. G. Gilbert Scott.
„ 2. Messrs. Austin & Paley.
„ 3. Mr. W. J. Tapper.
„ 4. Mr. Malcolm Stark.
„ 5. Mr. C. A. Nicholson.

We publish large illustrations of Mr. Scott's design and small illustrations of the others, to give a general idea of them; these latter we shall republish on a large scale, with plans, section and detail, as soon as it is possible to do so: we need not therefore give a detailed description of them now, but some particulars of Mr. Scott's design will be found on the opposite page

The designs are practically the development of those submitted in the preliminary competition. At the time we expressed our disappointment with this earlier competition, and we are not able to modify our disappointment now that we have seen the fuller development of the five selected designs. In not one of them is there to be found a thorough grappling with the problem in hand, a modern cathedral, but in all are to be noted the trammels placed upon the effective working out of a really satisfactory scheme by the known predilections of the Committee for Gothic, and the absence of definite knowledge as to what the Committee required in respect of accommodation and disposition.



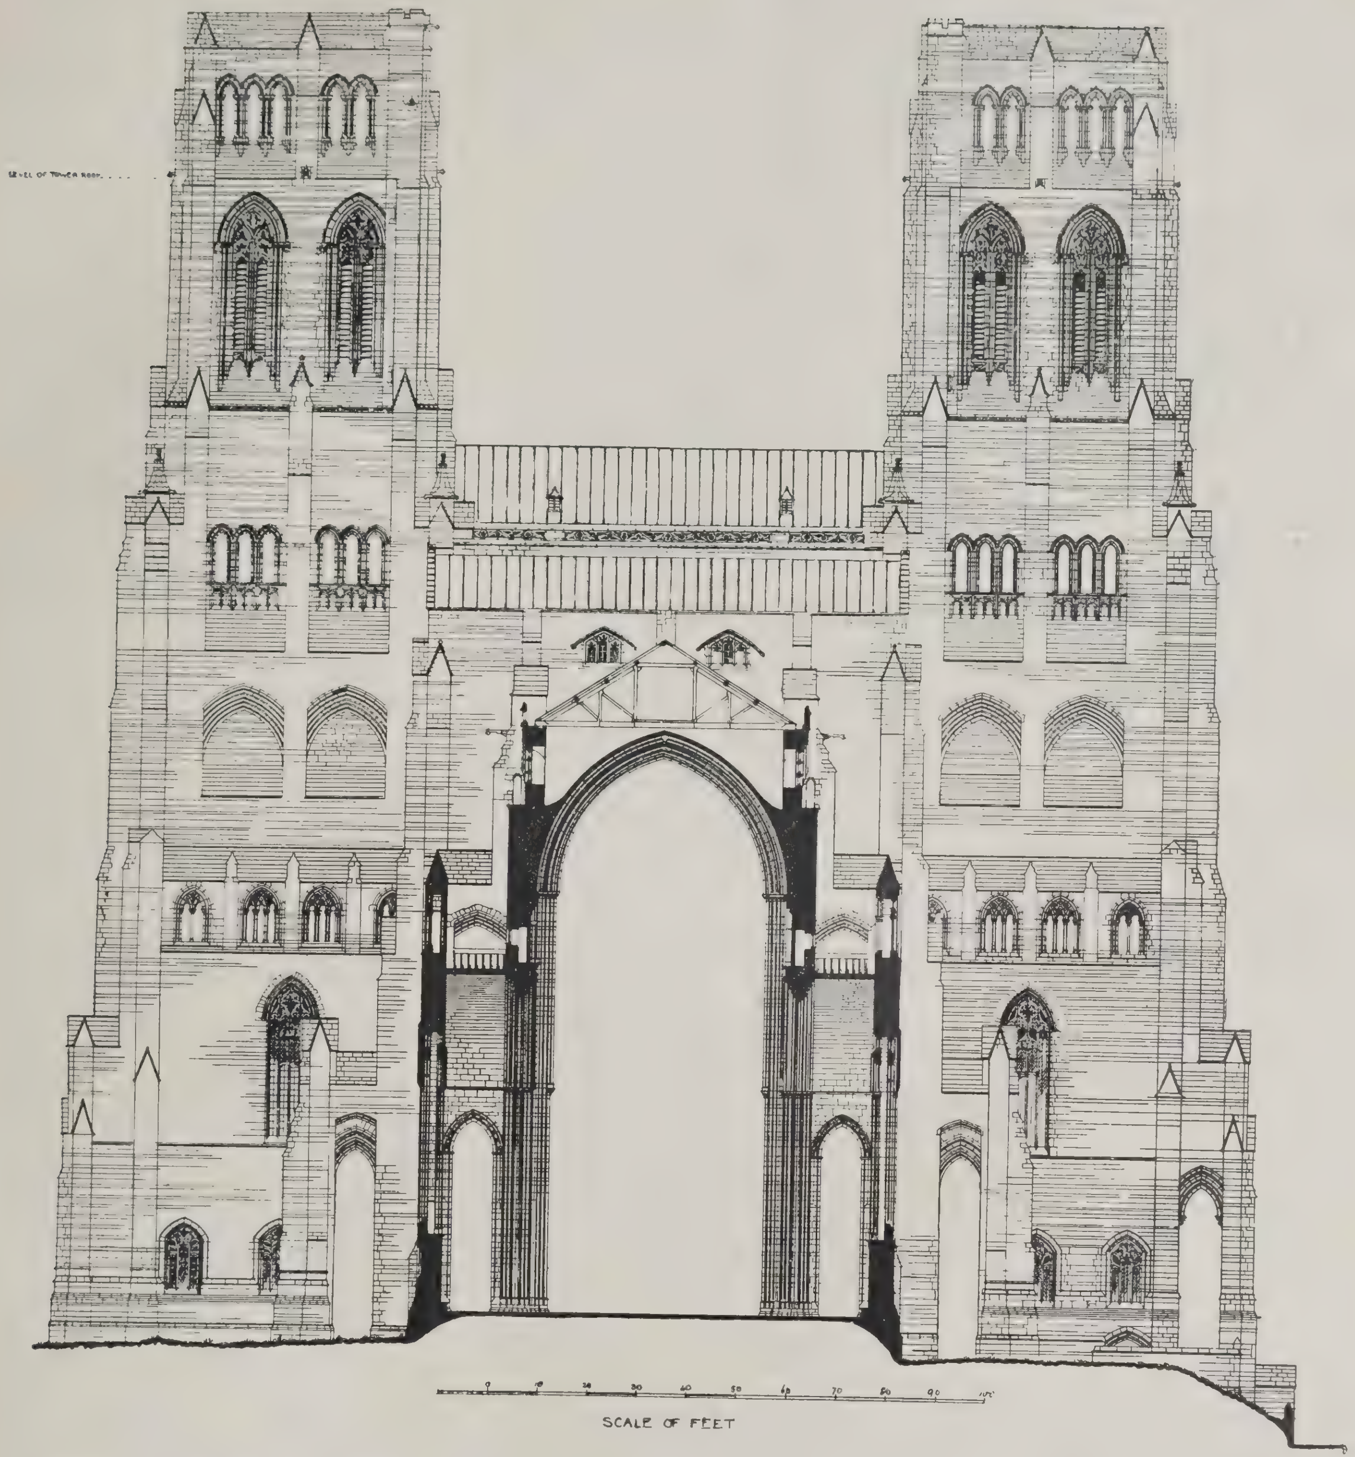
DESIGN FOR LIVERPOOL CATHEDRAL BY G. GILBERT SCOTT: PLAN OF CRYPT.

Of the five designs submitted we cordially endorse the advisory architects' selection of No. 1, as the one best worked out, showing greatest interest and originality, and suggesting the most scholarly yet restrained detail. But as we remarked when this design appeared in the earlier competition as No. 68, the transverse barrel-vaulting in the nave and chancel roofs "would, we think, undoubtedly mar the acoustics of the building without possessing any mitigating advantages." As traditional Gothic revivalist work this design has merit; but what we should like to see would be equal knowledge and skill applied, upon less orthodox lines, to the solution of the problem of a cathedral built in present times and entirely suited to modern needs.

Design No. 2.—The grouping of the two transept towers and of the central tower and dome does not strike us as happy and well-balanced. In the detail there is great monotony and a want of effective proportion, whilst the hidden-iron-girder construction in connection with Gothic forms seems to us to be singularly out of place as not conforming to the construction which prevailed in Gothic times, which would seem to be desirable in the case of a design based upon mediæval detail. In this design, more than in No. 1, we seem to see exemplified the unsatisfactory note of all the designs, an ill-digested magnifying of parish church work and the re-hashing-up of familiar mediæval forms. In particular we may notice the one-bay-multiplied-ad-lib style of treatment in the nave, and the juxtaposition of coarse detail in the lower stages of the central tower with the more attenuated detail adjacent, as though there had been, owing to the size of the building, an exhaustion of the records of precedent. After a study of this design for the Liverpool Cathedral, we recall the church at Stockport by the same authors with the greater pleasure.

Design No. 3.—This design is a further illustration of that which we should like to see the end of, the busy reproduction of mediæval forms. At the north (orthodox west) end two flanking towers, at the crossing a flèche, at the south (orthodox east) end a tower and a spire campanile, and interminable details of altar cloth, font, cloister fountain, and such like, suggest a commendable study of mediæval architecture by the author of this design, but not a grasp of the requirements of a modern cathedral as a result of those researches. This is the twentieth century and not the fourteenth; but were this design carried out, and mellowed by time, it might be difficult to say whether the fabric were a nineteenth-century "restoration" of some mediæval cathedral, or a full-sized model of old work. We should think the cathedral would cost much more than £500,000 if all that is suggested by these drawings were carried out.

Design No. 4.—The author of this design appears to have endeavoured to adapt to the purposes of a cathedral the plan of a wide nave and narrow aisles frequently seen in modern parish churches. The result is a large unimpeded area for the congregation, but in so large a building those at the end of the nave would not be well placed for hearing the preacher, if that is a *sine qua non* for a cathedral. A flat roof and the position of the bishop's throne behind the altar are unusual features. The interior is not happy in its fenestration, there being so little intervening wall-space as to give the appearance of tier upon tier of windows. Externally, there is not a proportionate disposition of the parts. Huge arches are rendered abnormally so in appearance by a multiplicity of small adjacent features;



DESIGN FOR LIVERPOOL CATHEDRAL: CROSS-SECTION THROUGH NAVE, LOOKING SOUTH. G. GILBERT SCOTT, ARCHITECT.

and the side and end elevations are not well balanced. The campanile is so far removed from the main fabric as almost to suggest its entire disconnection therewith. If the author of this design had been free to break from Gothic traditions, and to allow his versatility, which has produced no fewer than four different treatments of the cathedral subject, to evolve a fine conception of a modern building, we feel assured the result would have been more satisfactory. We blame the Committee and their notions, not the skill of the competing architects.

Design No. 5.—In this design an hexagonal crossing with a twelve sided lantern tower in two storeys superimposed, embracing the nave and aisles, and flanked by four semi-hexagonal blocks forming transepts, decidedly unusual; but these features are very bulky and throw the rest of the building out of due proportion. We should think that, subject to its being Gothic, it would be not easy to get a larger preaching-space than is secured by this design, yet it has shared the same fate as the other four, which seems to lend some colour to the persistent rumours which prevail to the effect that the ostensible reason put forth by the Committee for rejecting all the designs is not the real one. The detail of this design, traditional Gothic, by an author whose accomplished work is so much fresher and more interesting than in this design, makes us again express our regret that the conditions laid down and the predilections expressed by the Committee have brought about a lifeless result, instead of what should have been the most noteworthy architectural event of the year.

Mr. Scott sends us the following particulars of his design:—The general treatment is severe and relies for its effect upon the grouping and proportion of the various parts. In order to increase the effect of mass, transepts have been introduced throughout the length of the building; the interior of these transepts being well lighted, and the intervening barrel-vaults fairly dark, would give a curious effect of light and shade to the interior. The nave and choir are wide (50ft.), the aisles narrow, being intended solely as a means of access to the seats. The entrance at this quasi west end consists of three great arches which open upon the cloister court. The cloisters enable persons alighting from carriages to reach the building under cover should it be necessary. The large flanking towers—connected by a gable higher than the adjoining nave and choir roofs—form the culminating feature of the exterior. The stone proposed was red Runcorn with wide joints.

Views and Reviews.

The Ventilation and Heating of Churches, &c.

This little work provides a good deal of wholesome thought for architects and others on an exceedingly intricate and troublesome, though necessary, science. The author has brought many years' experience to bear upon his subject, not only in considering the theories advanced by ventilating experts, but in an examination of the results achieved by them in various buildings. It is almost needless to add that these results do not in many cases agree with the ideas and intentions of the designers. The nett result of the author's investigations seems to demonstrate that all "systems" of ventilation are more or less open to question; that every building must be considered solely on its own merits; and that any attempt to fit a building to a "system" instead of a system to a building is fore-doomed to end in failure. Many architects will doubtless be surprised to learn that such outside influences as the position of the building in the street, the width of the street, the position of the street with regard to prevalent winds and the points of the compass, the height of the surrounding houses, &c., all play important parts in deciding the best scheme for ventilation and its application. The author points out (p. 38) that "example after example can be given of buildings where natural ventilation, as it is sometimes called, has been adopted, and where calculations had been most carefully made of the exact outlet space necessary when so many Tobin shafts of such an area were furnished, but the position of the buildings in the town, the probable action of the prevailing winds, and the ground swirl or suction never received a thought. The consequence is that all these nice calculations are useless, and the system (?) of ventilation has its action reversed every time there is a strong breeze or wind blowing. The larger the apertures in the shaft inlets the more violent will be the wind effects."

Chapter V., which is entitled "Churches and Public buildings as they are," gives several examples of structures examined by the author disclosing defective ventilation, and is illustrated by numerous valuable diagrams showing the air-currents found to exist in these buildings. No good purpose would be served by a long review of this book, which is full of experience notes. It is a book every architect and student should possess, and possessing, should read, mark, learn and inwardly digest. There is no subject that is so little understood by architects as ventilation.

"The Ventilation, Heating and Management of Churches and Public Buildings." By J. W. Thomas, F.I.C., F.C.S. Price 2s. 6d. London: Longmans, Green & Co., 39, Paternoster Row.

NEW MIDLAND HOTEL, MANCHESTER.

We regret that a mistake occurred in our reference to the work done at this hotel by Messrs. Peace & Norquoy, of Ancoats, Manchester. They did not supply any of the well-known folding partitions of which they are the patentees and makers (the latest particulars of which can be gathered from the advertisement on p. xi of this issue), but obtained the order for the internal fittings (not furnishing) to the service-rooms, cloakroom, counters, fixtures and a large quantity of cupboards and shelving for storerooms, and over 300 mahogany and oak tables. The patent folding partitions made by Messrs. Peace & Norquoy are admirably simple and compact, and have been fitted in schools, colleges, churches, lecture halls, &c., all over the kingdom. They consist of a series of hinged leaves carried by pulley-wheels at the top, being guided at the bottom by a groove across the floor. The leaves are made in panelled framing from 2in. thick, with wood or glass panels, and fold back one on another against the wall when it is required to have the room clear. The partitions occupy very little space and possess that rigidity so essential in a schoolroom; they run with the greatest ease and have no tendency to stick. A list of the buildings for which they have been supplied shows the remarkable popularity which these partitions enjoy. The only preparation needed for them is a wood beam at the top, not less than 7in. wide on soffit, to which the gearing can be attached; thus there is no cutting away of joists and the forming of deep channels in the floor; and being firmly secured at the top, there is no risk of accident from the sections falling over. For all purposes where it is desired to divide up any room these partitions will be found to give the utmost satisfaction.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Problem in Land Surveying.

LONDON, S.E.—A SUBSCRIBER writes: "Kindly give the solution to the following question, recently set at an examination on land surveying:—'Construct a triangle A, B C, having its sides A B = 3in., B C = $2\frac{1}{2}$in. and A C = $1\frac{1}{2}$in. Suppose the points A, B and C to be trigonometrical stations of a survey, and that from a point D of a traverse, A bears 120 degs., B 150 degs. and C 165 degs., find the point D by construction.'"

In cases of this kind it is sometimes supposed that the observed angles can be plotted as reverse bearings from the known points A B C to intersect on point D, but this will only happen if the bearing of one of the sides of the triangle A B C is given. Failing this, the method to be adopted will be that used in hydrographical surveying for observations from a boat. Plot the triangle A B C in any position with the letters clockwise, then note that the bearing of A being 120 and B 150, the angle between the two directions is 30 degs. Upon each extremity of the base A B set up an angle of 90 − 30 = 60 degs., and from the apex of the triangle so formed describe a circle passing through points A and B. Then note that the bearing of B being 150, and C 165, the angle between the two directions is 15 degs. Upon each extremity of the base B C and upon the side facing A set up an angle of 90 − 15 = 75 degs., and from the apex of the triangle so formed describe a circle passing through points B and C. The intersection of the two circles will give point D, and the north point being placed so as to make D A bear 120 degs. eastwards, the other points will be found to have the observed bearing. HENRY ADAMS.

Walls, Floors and Ceilings of Infectious Diseases Hospital.

CARDIFF—PERFECT writes: "How are the walls and ceilings of an infectious diseases hospital best finished, and of what material should the floors be composed?"

Walls: Render and float $\frac{5}{8}$in. thick in equal parts of Portland cement and clean washed sand, and set with neat Keene's cement $\frac{3}{16}$in. thick, finished with a smooth face for painting. *Ceilings:* Lath, render $\frac{1}{2}$in. thick with haired mortar gauged with Portland cement, float with equal parts of Portland cement and clean washed sand $\frac{1}{4}$in. thick, and set with Keene's cement, finished with a smooth face for painting. All internal and external angles of plastered walls and ceilings to be rounded. *Concrete under Floors:* The concrete under the ward floors to be 6in. thick, composed of 1 part Portland cement and 5 parts of clean broken brick, slag or other approved material, broken to pass a $\frac{3}{4}$in. gauge, well rammed, levelled and floated to a fair and even surface to receive a layer of bitumen. The concrete to be laid on a bed of approved dry broken brick or stone filling 6in. thick, thoroughly well rammed and levelled. *Ward Floors:* To be of $1\frac{1}{2}$in. teak in $3\frac{1}{2}$in. widths, wrought, grooved, tongued and rebated for secret nailing, with grooved and tongued heading joints. The floor boards to be tightly wedged up, secret nailed with $2\frac{1}{2}$in. nails weighing 20lbs. per 1,000, and laid solid on 3in. by $2\frac{1}{2}$in. creosoted fir joists splayed on one edge, spaced 14in. apart and embedded in the concrete. Before the floor boards are laid the concrete is to be covered with a layer of bituminous composition $\frac{3}{8}$in. thick, composed of pitch and tar mixed in the proportion of 1 cwt. of pitch to $7\frac{1}{2}$ gals. of tar, boiled together for at least one hour, so that whe cold it is elastic and tough. The fir joists t be creosoted in vacuum until the moisture i extracted, afterwards subjecting the creosot to a pressure of not less than 100lbs. pe sq. in. until 8lbs. of creosote per ft. cube hav been injected into the timber. The floors t be finished with 3in. by 3in. solid teal hollowed skirting, grooved for floor board and chamfered for plastering, with soli circular teak blocks to all quadrant corners rounded angles, &c. The skirting to b fixed to the floor-joists with 3in. screws, th heads of the screws being let in and covere with white-lead putty tinted to match th colour of the wood. After the floors are lai the surface is to be rendered non-absorben by treatment with paraffin in the followin manner—Paraffin in the solid state to b melted and poured over the wood floo and then forced into the pores of the woo with hot irons. The surface to be the thoroughly well polished by rubbing with brush. The wood skirtings to be also treate in the same manner. Another form of floo construction which is largely used for infectious hospitals consists of concrete floo finished with pitch-pine or other wood bloc paving, whilst in some instances marbl mosaic paving has been adopted. Th latter description, whilst excellent in som respects, has, however, the disadvantage o being very cold to the feet of patients i they stand or walk upon it. T. E. C.

Sale of Practice.

DEVON writes: "What would be a fa price to ask for a county architect's practic bringing in a nett income of, say, £500 year?—in addition to which there are tw public appointments bringing in an averag of £100 a year: total £600?"

The value of a practice is an exceedingl difficult thing to determine, varying fro one to three years' purchase according t circumstances. To ensure a high value, th average income must have been fairly stead for a considerable number of years as substantiated by well-kept and properly audite books, and the seller must be able to giv such an introduction as would lead in a probability to the maintenance of at lea an equal average by a competent successo In the present instance succession to th appointments would be problematical—o at any rate speculative; and the loss o either might very possibly entail loss o *clientèle* also by introduction of a riv practitioner. In fact, the practice is wort just so much as it is worth a purchase while to give for it. This could only b ascertained by sealed offers after sever gentlemen had been allowed to inspect th books and been told the circumstances ful —or by arbitration if only one probab purchaser be in view. DESIGN FOR LIVERPOOL CATHEDRAL: LONGITUDI

SECTION. G. GILBERT SCOTT ARCHITECT.

THE NEW KEW BRIDGE.
SIR JOHN WOLFE BARRY, K.C.B., AND C. A. BRERETON, M.I.C.E., ENGINEERS.

Keystones.

The new Kew Bridge was opened by his Majesty the King on Wednesday last. In our next issue we hope to publish the engineers' drawings.

Sutton Coldfield Competition.—The Town Council of Sutton Coldfield, near Birmingham, has accepted the design for its proposed town hall by Messrs. Mayston & Eddison, of Bedford Row, London, and Wharncliffe Chambers, Sheffield. About forty firms of architects competed. A leading feature of the structure is that it consists of one storey only. The town hall is intended to hold 650 persons. It is probable that a gallery will be added, to afford accommodation for 150 more. The length to the stage will be 78ft. and the width 42ft.

The Preservation of Historical Buildings.—In the House of Commons last week Mr. Yoxall asked the First Lord of the Treasury whether he would consider the appointment of a Select Committee of the House to enquire into the desirability of establishing in the United Kingdom a system of national protection and conservation of buildings of historical or biographical interest, such as exists in France under the Loi du 30 Mars, 1887, whereby a Government grant of 1,427,000 francs is available for the purpose this year. Mr. Balfour said he should be very sorry to express any opinion on the question, or even go the length of saying that it was ripe for discussion before a committee of the House. He had looked at the French law and found that it entirely turned on the discretion of a Minister who was competent, or understood to be competent, to deal with questions of this kind. He was not sure that he would like to add to the labours of the central Government in this country such responsibility as the copying of the French law would entail.

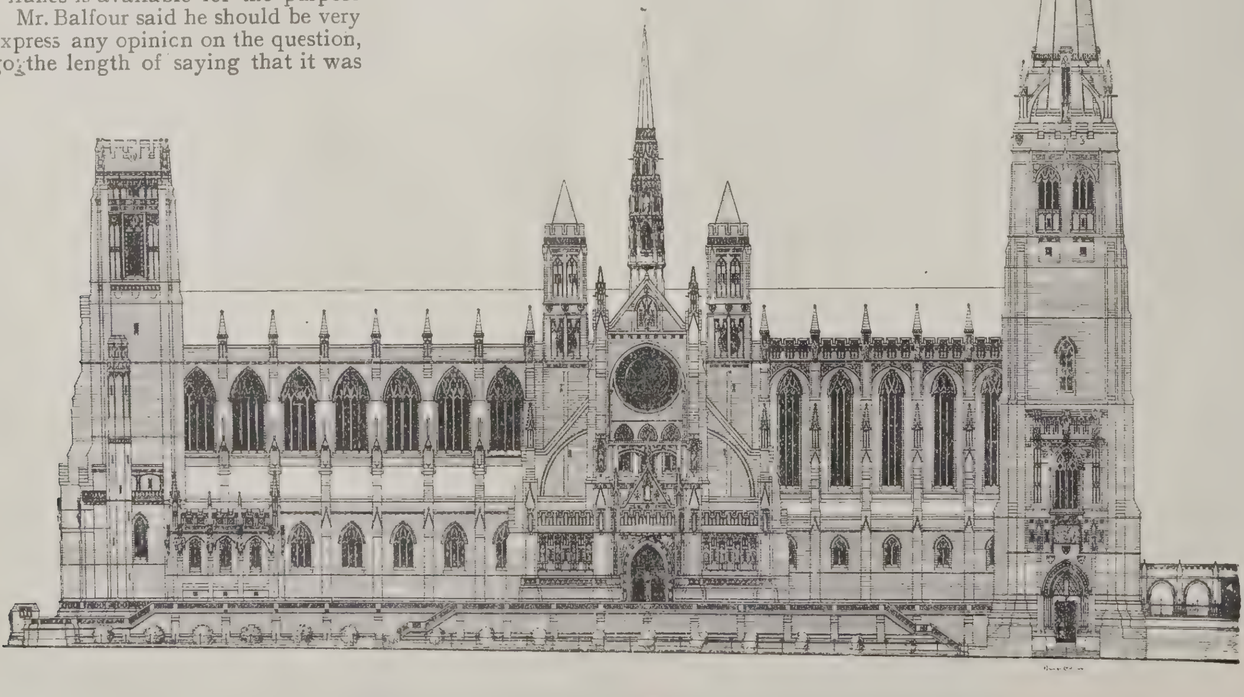
The Stratford-on-Avon Cottages.—At a council meeting of the British Archæological Association held last week the following resolution was passed: "That, having heard Mr. Allen S. Walker's account of the proposed alteration to the house of Shakespeare's cousin (known as Birch's shop), it is the opinion of this council that it is desirable that its condition should be interfered with as little as possible, and that the removal of the brick front should not be carried out." A second resolution was to the effect that the removal of the brick fronts from the cottages adjacent to the birthplace should not be carried out.

Vauxhall Bridge: Plaster Pylons to be Erected.—At last week's meeting of the London County Council the revised design for the new Vauxhall Bridge (published in our last issue) came up for discussion. Mr. Straus moved an amendment that the question of the pylons should be deferred until the Bridges Committee had further reported. Mr. Norman Shaw, one of the most eminent architects of the day, had expressed himself in favour of having pylons at the entrance to the bridge on the north side. Mr. Emden thought the pylons should only be carried up far enough to form bases for statuary. All that was necessary to make a handsome bridge had been brought into the design submitted, which met with the general approval of a large body of the most eminent artists and architects. Mr. Burns thought that the pylons should only be carried up to the level of the parapet. Upon that foundation they could cheaply erect plaster pylons to the height suggested in order that their effect might be considered before permanent structures were placed there. The amendment was carried and Mr. Burns's suggestion adopted.

Edinburgh Surveyors' Students. — The Ordained Surveyors' Students' Society of Edinburgh met on April 27th and agreed to form a Society for the Advancement in Knowledge of the Profession of Quantity Surveying by increasing the facilities for study and intercourse. The following office-bearers were elected:—Hon. president, A. K. Smith; president, W. Y. Carrick; vice-presidents, J. F. Knot and J. Webster; secretary, W. Scott; and treasurer, J. Storie.

Obituary.

Mr. James Greig, architect, of Aberdeen died last week at the age of thirty-six years. After being educated at the Grammar School, Mr. James Greig served his apprenticeship with Messrs. Ellis & Wilson, architects, Aberdeen, but afterwards went into the employment of Messrs. Jenkins & Marr, architects and civil engineers. Ill-health, however, compelled him to seek a warmer climate, and he went to Australia, where he remained for two or two years. On his return home he again went into the employment of Messrs. Jenkins & Marr, to whom he became head draughtsman.



DESIGN FOR LIVERPOOL CATHEDRAL BY MALCOLM STARK.

Builders' Notes.

The New Board Schools, Canterbury, have been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their patent Manchester grates.

The Sunderland Building Trade Dispute between the builders and bricklayers has been amicably settled, both sides having withdrawn their demands.

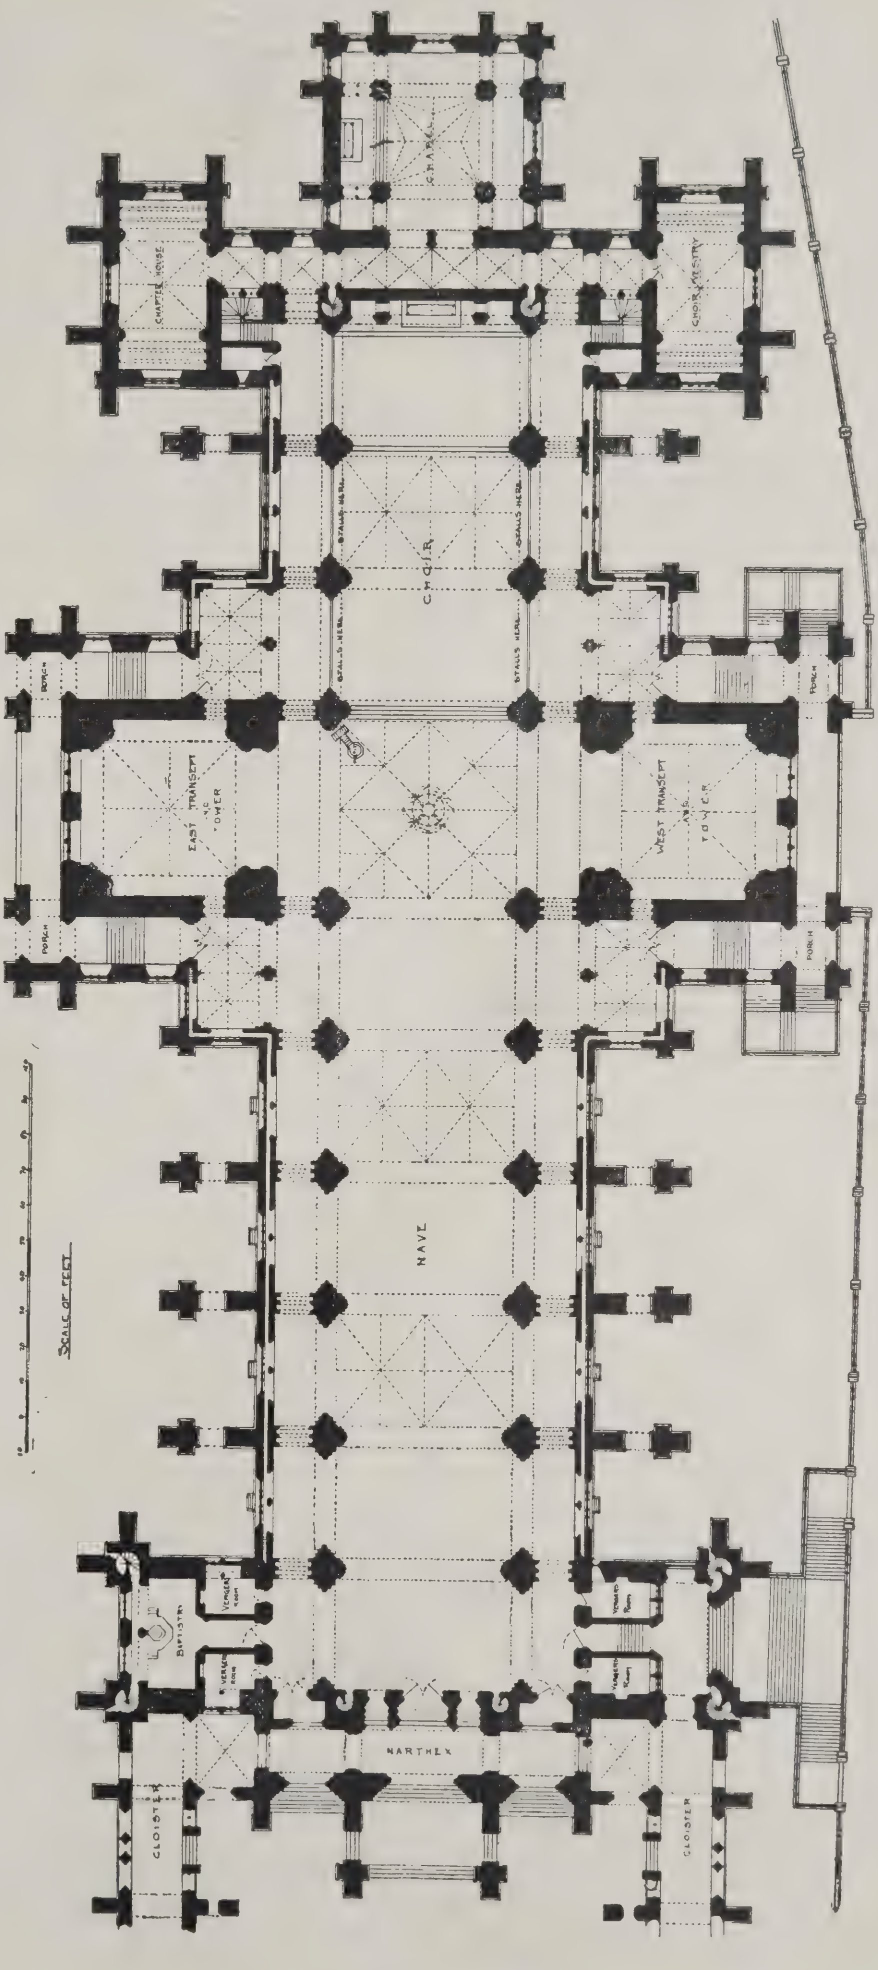
The new Police Station, Amlwch, has recently been fitted with the latest improved improved "small tube" hot-water heating apparatus by Messrs. John King, Ltd., engineers, Liverpool, who have employed their economical coil heater.

A New Varnish.—Messrs. John Mathews & Co., of Hatton Garden Works, Liverpool, have introduced a new oak varnish, made of the best materials, and lacking only the paleness of the higher-priced article. But though dark in appearance, it is not dark in use, and, save, of course, for employment on white or enamel surfaces, is claimed to fill every purpose as well as the costlier varnishes. The new varnish is made up in decorated tins, and is sold at 6s. 6d. per gallon, delivered free.

The recent Ottawa Fire was not so extensive as the Ottawa-Hull conflagration of April 26th, 1900. The district which has been practically devastated is one of those which were burnt out three years ago, and, apart from the lumber-yards, was covered principally by working-class houses. The municipality had forbidden the re-erection of frame-houses (timber), and most of the houses which have now been burnt were "brick encased"—namely, timber with an outside covering of bricks—roofed with shingles. As there were large lumber-yards to the north, south and west, the dangers of a fire in the district were very serious.

Fireproof Floors.—The Edinburgh Fever Hospital, which was opened by the King and Queen, is the largest and probably the most up-to-date fever hospital in Great Britain. It is said to have cost nearly half a million, and has been over five years in erection. An important detail in construction are the fireproof floors and ceilings, which cover over four acres and are of steel and concrete, and sound-proof. From various systems submitted, that of Messrs. Potter & Co., Ltd., of 66, Victoria Street, London, was selected. The floors, &c., occupied four years in construction, and on completion the architect wrote: "I have pleasure in stating that the work itself and your method in dealing therewith have been to my entire satisfaction." Mr. Potter was for many years clerk of works to the late Lord Ashburton.

The St. Helen's Building Dispute has been referred to the arbitration of Judge Shand, of the Liverpool and St. Helen's County Courts. The Bricklayers' Society claimed that they were entitled to walking time if the job at which they were employed was more than half a mile from their employer's yard or place of business. Judge Shand said he understood his duty was to construe the rules as they stood, and his award is as follows:—(1) The word "country" in rule 6 of the working rules means the district lying outside and beyond the boundaries of the borough of St. Helen's. (2) The operatives are not entitled to walking time within the borough of St. Helen's from St. Helen's employers assessed by the Corporation of St. Helen's. (3) A workman is not entitled to walking time if he voluntarily applies for work on a job. The award altogether upsets the practice for years past observed in regard to walking time, and the Bricklayers' Society will doubtless give immediate notice for a revision or reconstruction of the whole of the rules under which they work.



DESIGN FOR LIVERPOOL CATHEDRAL PLACED FIRST BY THE ASSESSORS; GROUND PLAN. G. GILBERT SCOTT, ARCHITECT.

S.K. EXAMINATIONS, 1903.

BUILDING CONSTRUCTION: Advanced Stage.

[The questions and answers in the Elementary Stage were published in our last issue. Questions marked with an asterisk have accompanying diagrams. The examination in this subject lasts for four hours. You may not answer more than six questions.]

21. What is quicklime, and how is it produced? Use such terms as you think would be intelligible to a workman familiar with the handling of lime and plaster-of-Paris, and describe (*a*) what happens when water is applied in quicklime, (*b*) what happens when plaster-of-Paris is mixed with water—to be used for casts: giving the best rational explanation you can of the actions. (24)

Quicklime is burnt limestone. The limestone is broken to a suitable gauge (when the limestone used is chalk it is burnt in fairly large lumps); it is placed in a kiln with fuel; the fuel is lighted by burning fuel in the "eyes" at the bottom of the kiln, and the heat is kept up till the limestone is sufficiently burnt. Limestone is sufficiently burnt when the resulting quicklime will slake to a paste when water is added to it (or, if the student knows some chemistry, quicklime is an oxide of calcium, CaO, together with small quantities of other substances. Limestone, which is mainly $CaCO_3$, is heated in a kiln sufficiently to drive off CO_2, when $CaCO_3$ becomes CaO). (*a*) The quicklime becomes hot and slakes, that is, it falls to dust, or if sufficient water is used it becomes a milk or paste [or the oxide becomes a hydrated oxide, $Ca(OH)_2$]. The applied water combines chemically, forming a new compound disturbing and breaking up the structure of the pieces of quicklime. (*b*) The plaster mixes with the water to form a paste, but it soon sets solid, readily taking the shape of the mould in which it is placed. Plaster-of-Paris results when water of crystallization is driven off from gypsum by heat. It sets by taking water to itself again, which enables it to recrystallize.

22. You have a special kind of timber from which to take flooring joists. The formula

$$\Delta = k\frac{wL^4}{bd^3}$$

expresses a law, where Δ stands for the drop or deflection at the centre, *w* the load per unit of length, *L* the length between the supports or bearings, *b* the breadth or thickness, *d* the depth. Describe an experiment (using a piece of the timber and making use of bricks for loads, &c.) by which you can determine *k*. (24)

See note to question 24.

Take a piece of the timber (fairly uniform and straight grained), say 6in. wide and 1in. thick, long enough to rest upon two bricks 6ft. apart. Load the span with bricks, on edge and not touching one another, placed symmetrically. Measure the deflection at the centre caused by the load; weigh the bricks per unit of length. We now have Δ and *w*; we know *L*, *b* and *d*; and substituting these values in the equation, we find the value of *k*.

23. Assuming that you have made the experiment of the previous question, and that you have found *k* to be ·000000084 (the units being foot and hundredweight), what is the stress per unit of cross-sectional area on the outer fibres at the cross-section of greatest bending moment:
$L = 20$ft., $b = \frac{1}{6}$ft., $\Delta = \cdot05$ft., $w = 1\cdot25$ cwt.? (36)

See note to question 24.

From question 22,

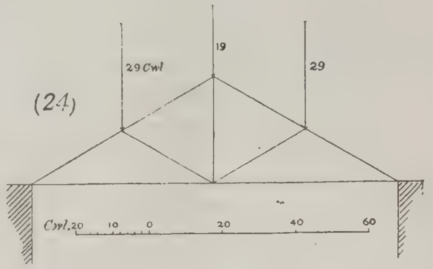
$$d^3 = \frac{b\Delta}{kwL^4} = \cdot496.$$

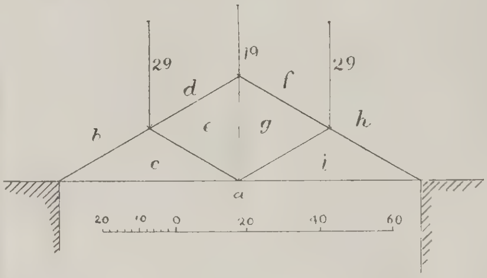
Take the cube root of ·496 (by the tables): it is ·792, $d = \cdot792$. The bending moment at the middle of the beam = 62·5, and this is resisted by $\frac{bd^2}{6}p$, where *p* is the stress per unit of area on the outer fibres (see BUILDERS' JOURNAL, November 13th, 1901, p. 237). $p = \frac{36 \times 62\cdot5}{\cdot792^2} = 351\cdot5$.

*24. Draw the stress diagram for the roof-truss loaded as shown. (29)

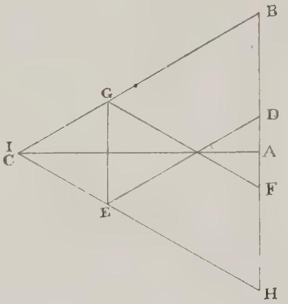
(NOTE.—A candidate can obtain marks for not more than two of the three questions, Nos. 22, 23 and 24.)

See illustration below.





(24)



25. Answer only one of the following, (*a*) or (*b*):—

(*a*) Bricks (9in. by 4½in. by 3in.) cost 35s. a thousand; Portland cement costs 3s. 6d. a bushel; sand costs 2½d. a bushel (all as delivered on the works). What is the cost for these materials for a cub. yd. of two-brick wall (mortar, 1 of cement to 3 of sand, joints to show ½in. thick) (twenty-one bushels in 1 cub. yd.)? (33)

(*b*) Bricklayers' wages are 1s. an hour, attendants' wages 6d. an hour; for plain walling, 16ft. to 30ft. over ground, give a reasonable proportion between cost for bricklaying and cost for attendance. Including both items, what is a fair cost per cub. yd. for workmanship? What other items of expenditure should be charged to the brickwork? Give reasons for your proportion and estimate. (33)

(*a*) Assume the bricks to have no frog: size of each brick plus the mortar is 9¼in. by 4¾in. by 3½in. = 131·8 cub. in.; size of a brick = 114·75 cub. in. Mortar for each brick = 17·05 cub. in. Cubic inches in 1 cub. yd. = 46656. Number of bricks in a cub. yd. (at 131·8) = 354 nearly. 354 by 17 = 6018 cub. in. = mortar in a cub. yd. In 8 cub. in. mortar there are 9 cub. in. of sand. In a cub. yd. of brickwork there are—

	s.	d.
3 bushels of sand at 2½d. -	0	7½
1 bushel of cement - -	3	6
354 bricks, say - - -	12	5
	16	6½

(*b*) *One* bricklayer and *two* labourers five hours to build 1 cub. yd.: cost 10s. a cub. yd. Scaffolding, use of tools, shovels, hods, mortar boards, besides supervision, timekeeper, pay clerk, &c.—proportions of the cost.

26. In towns where ashlar masonry is common the lintels to window and door-openings, though of excellent stone, are seen to be in very many cases broken across; explain the cause of this. How might this fracture of lintels be prevented? (24)

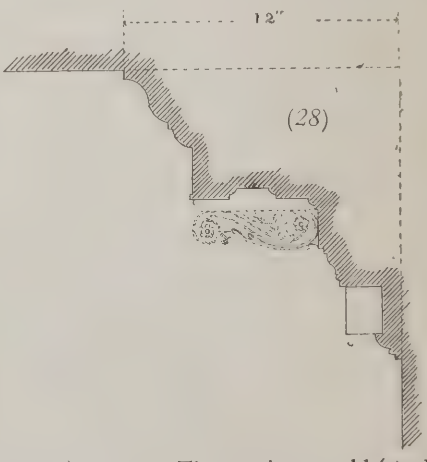
It will be seen on examination that a lintel is held at each end tightly gripped between the head of the reveal and the wall over, so that on the slightest settlement of the building the lintel must break. Either set the lintels with splays on skewbacks, or provide for their being kept loose in the wall till all settlement has taken place.

27. Draw (*a*) the elevation, (*b*) a vertical cross-section at the centre, and (*c*) a half horizontal cross-section (just over the grate) of a good register grate fireplace to the scale of ⅛. How is the fireblock back to be renewed? How is the chimney to be swept and the soot cleared away? (33)

See illustration. A register grate should stand simply on the hearth, but in such a way that it will bear at the edge (sides and top) to make a close joint. It should be easily lifted forward to have the chimney swept or to remove any soot that may fall down and lie between the grate and the back of the recess, or to have the fireblock renewed.

*28. A cornice of the cross-section shown is to be formed round the ceiling of a room: describe the complete operations (omit the making of modillions and their attachment, also the finishing of the soffit): describe the materials used: describe moulds, screeds, rules and tools used, and modes of using them. How are the dentils made and attached? Describe the working of a mitre. (36)

The foreman plasterer instructs the carpenter or joiner to put up brackets to give space for laths and cornice stuff. When walls and ceiling are first coated the lathing or the brackets is also first coated with gauged coarse stuff. Walls and ceiling being floated and fairly dry, *screeds* are adjusted on ceiling and walls on which the running mould shall run true. Running *rules* are fixed to the walls; stuck with gauged putty; nailed; supported with bobs of gauged putty. The running mould (stock, slipper, stay) is fitted with a muffle plate on the stock; the cornice is roughed out in gauged coarse stuff to the lines of the muffle plate. The muffle plate is removed and the true



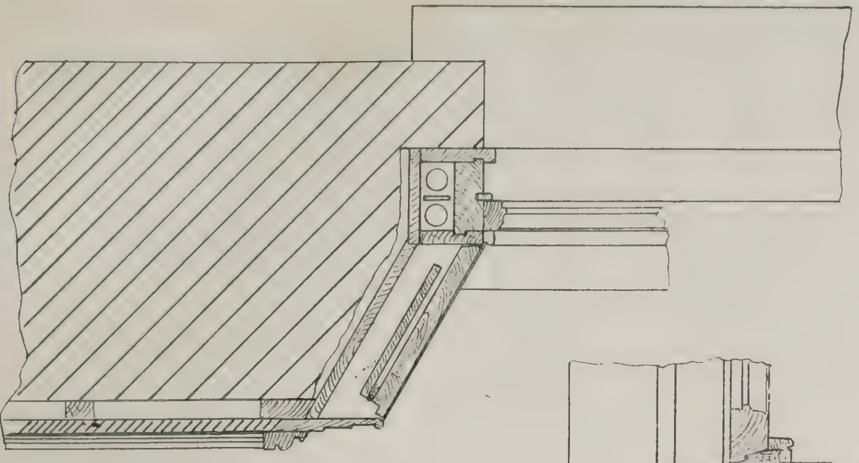


plate put on in place of it (plate of sheet-zinc cut truly to profile of cornice). Plaster-of-Paris is placed on the clean mortar-board; it is wet and mixed with lime-putty; for this rather heavy cornice two men may be at the running mould and two men laying on; there will be a plasterer at the board and a labourer attending with fresh putty, &c.

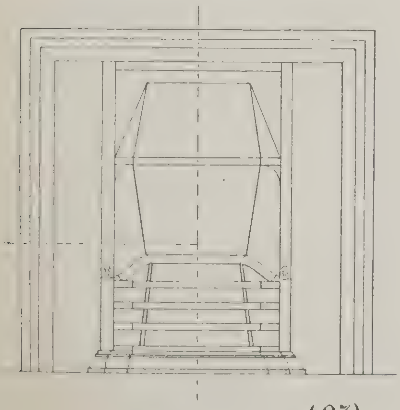
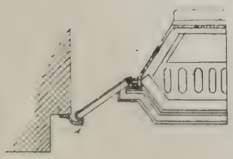
Dentils are rectangular blocks; they are conveniently made between square plates of zinc set in saw-cuts in two pieces of cleaned battens; the cells so formed are filled with gauged putty; this sets, the boards are removed, and the dentils are found separated by the pieces of zinc (the zinc and boards should be oiled); dentils are attached in the groove made for them by sticking them on with thin gauged putty; a mitre is made by working the surface formed by the running mould into the angle with a thin straight-edge of steel about 3in. wide, pointed at one end. Various small steel tools with thin flexible points are used to work the small details at the mitres (called mitring tools).

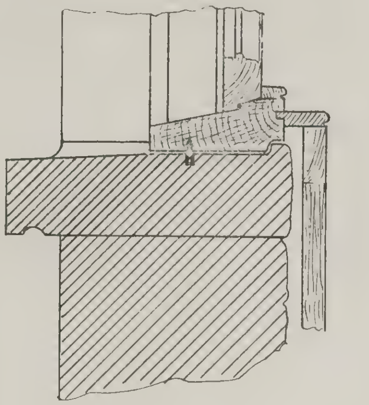
29. A right circular cone roof, over a lantern, is 8ft. in diameter at the eave; it is 3ft. high (from base at eave to vertex); it is to be covered with copper plates in the manner of slating: they are trimmed and bent to fit on. The margin is 6in., the lap is 3in.; the apex is finished with a conical cap of sheet-copper 8in. diameter at the base; the sheet-copper weighs 3lbs. per super. ft.; omitting nails, what is the total weight of copper on the roof? (33)

The area of the cone is 20π; for two thicknesses of copper it will be $40\pi = 125·664$. But there will be nine rings, each 3in. wide, of three thicknesses (the laps); the average ring is 1·571; the area of nine rings is 14·139.



(27)





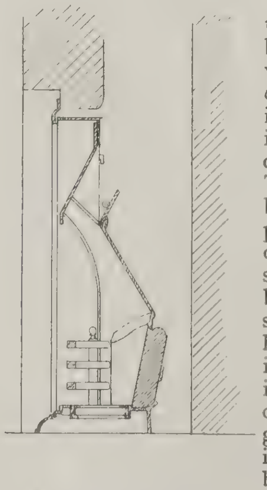
The area of the cap is 62·83 sq. in. = ·436 sq. ft.

Two thicknesses of copper -	125·664
Extra for rings - - -	14·139
" " cap - - - -	·436
Square feet - - -	140·239
	3
Weight of copper - -	420·72 lbs.

This takes no account of the extra area, owing to the thickness of copper plates being added to the sheeted cone.

30. Draw carefully to the scale of $\frac{1}{8}$ the horizontal cross-section of a fully-trimmed window through one jamb and reveal. The wall is of stone, ashlar face; reveal 6in. deep; wall 2ft. thick, battened (or stoothed). Show jamb-lining, three-faced architrave, folding shutters (windows about 4ft. wide), ground, lathing and plaster. Sketch to the scale of $\frac{1}{6}$ cross-section through sash bottom rail, oak sill and stone sill. If you adopt a water-bar, explain how you prevent water passing inwards at the ends of the oak sill. (28)

See illustration above.



It is of great importance that the job shall be weather-tight at the window sills. I have drawn the oak sill showing a water-bar, though it is unnecessary in the circumstances shown. There appears to me to be too general economy practised in this matter of stone window-sills as shown by drawings in books. I prefer window sills dressed as shown, having the oak sill set into them well-bedded in white lead. I can only account for the general apparent scamping of this work by the books being compiled by men living in districts where stones for thorough sills are not easily to be had. I do not depend on a water-bar, and therefore I need to take no precautions at the ends.

31. Answer only one of the following, (*a*) or (*b*):—

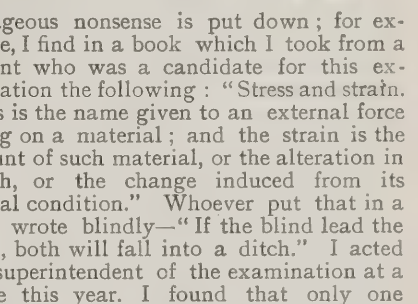
(*a*) Sheet-lead which is repeatedly treated to sudden dashes of warm (or hot) water wrinkles permanently in a remarkable manner (seen when a scullery or pantry sink is, as is occasionally done, lined with sheet lead); explain this. (24)

(*b*) Sketch neatly and cleanly a longitudinal section of a good screw-down bib-cock. (24)

(*a*) Lead has comparatively poor conductivity and its elasticity of shape is also poor; it has also a comparatively large coefficient of expansion. When sheet-lead is subjected to a dash of hot water the surface washed by the water expands before the heat reaches the under-surface, with the result that the metal of the top-surface is strained beyond the elastic limits of the material—it flows; again, when hot water is poured on a particular part this part expands and takes a pot or dome shape. Repeated treatment of this kind results in the wrinkling observed.

See illustration. This sketch is not given as showing the *best* form of screw-down bib-cock: it is a common kind. A screw, not shown in the section, prevents the joint at A from unscrewing when the cock is opened (the spindle may be tight in the stuffing-box). Lord Kelvin's form of screw-down cock is familiar. Students should not be content to know the action of an appliance of this kind; they should know why screw-down cocks are used in preference to plug-cocks, which are simpler, quicker in use and quite satisfactory in regard to water-tightness. Useful information of this kind is not usually given in text-books for teaching building construction. I find in many cases the most outrageous nonsense is put down; for example, I find in a book which I took from a student who was a candidate for this examination the following: "Stress and strain. Stress is the name given to an external force acting on a material; and the strain is the amount of such material, or the alteration in length, or the change induced from its normal condition." Whoever put that in a book wrote blindly—"If the blind lead the blind, both will fall into a ditch." I acted as a superintendent of the examination at a centre this year. I found that only one candidate had brought Indian ink and drawing instruments, and these had to be handed round for the tracing questions. Some of the candidates were men attending a university college. I said to them, "Did you not see in the syllabus that you were expected to do tracings in ink?" The only syllabus which they had seen was one in an old edition of Rivington's "Notes." Such carelessness and ignorance on all hands must have unfortunate results. It is quite time to say in these matters, "Wake up, John Bull!"

(31)



*32. Trace neatly in ink the drawing shown (see next page), also the writing and figures. (The Indian ink should be sufficiently thick to give opaque lines suitable for photographic printing; the lines should be well defined, uniform in breadth, having firm unbroken edges; they should neither stop short of nor go beyond the proper points.) (28)

The question sufficiently explains what is required to be done.

[The names "Elementary" and "Advanced" will disappear after this year. In future the stages will be I., II., III. and Honours.]

Law Cases.

St. Anne's Cathedral, Leeds: Right-of-Light Arbitration.—An arbitration enquiry between Mr. Thomas Ambler and the trustees of St. Anne's Cathedral, Leeds, arising out of the alleged damage to light by the erection of a new cathedral in Cookridge Street, necessitated by the intended demolition of the old cathedral for street improvements, was held at Westminster on May 18th, the evidence having been given in Leeds on the previous Monday. The umpire was Mr. Thomas Blashill, the arbitrators being Mr. John Hepper, of Leeds, for the claimant, and Mr. E. Flint, London, for the defendants. The witnesses who were called at the hearing in Leeds for the claimant were Mr. Thomas Winn, surveyor, Leeds; Mr. Charles Gott, architect and civil engineer, Bradford; and Mr. R. Horsfall, architect, Halifax—whose valuations were about £2,700, the amount of the claim; while those who gave evidence on behalf of the defendants were Mr. Charles Fenwick, surveyor; Mr. J. B. Fraser, architect; and Mr. Albert Smith, woollen merchant; all of Leeds—whose figures worked out at about £326. The umpire reserved his award.

"Single" Buildings under the L.B.A.—The case of *Goodchild* v. *Matthews* recently came before the King's Bench Division of the High Court of Justice. It was a case stated by the magistrate of the Marylebone Police Court as to the proper construction of section 77 (1) of the London Building Act, 1894. The appellant was the district surveyor for North Islington and East St. Pancras, and the respondent, a builder, proposed to erect six blocks of flats in a street called West Hill, in St. Pancras, and gave appellant due notice thereof under section 150 of the Act. The appellant served a notice of objection on the ground that the buildings would be in contravention of section 77 (1), which enacts that "buildings shall not be united except where they are wholly in one occupation or are constructed or adapted to be so." The magistrate found that each of the blocks contained its own staircase leading from the basement to the top and had a separate entrance from outside, and that there was a passage under the roofs leading from one end of the blocks to the other. The plans showed that the walls dividing the blocks were not carried up through the roof, but were of sufficient thickness to satisfy the requirements of the Act in relation to the thickness of party walls. The appellant contended that each of these blocks was a separate building, and that the respondent was proposing to unite them by means of the corridor in contravention of section 77 (1). The respondent contended that the whole was a single building containing several sets of flats which, though separate dwellings, were not separate buildings. The magistrate came to the conclusion that what the respondent proposed to erect was one separate building, and not a union of separate buildings under one roof, and that section 77 (1) only applied to the union of buildings which had in the first instance been completely erected as separate structures, and that it did not apply to the union of separate buildings in course of erection for the purpose of transforming them into a single separate structure. From this the present appellant appealed.—The Lord Chief Justice, in giving judgment, said that the surveyor had great powers, which ought to be exercised only when there was a clear breach of the Act. There was not the least doubt as to the proper construction of the section. The findings of the magistrate were justified by the evidence, and he should have come to the same conclusions of fact and law himself. With regard to the arguments of the appellant, he must not be taken to hold that putting a covered way connecting two structures would be a "uniting" within the section, but that the "uniting" was that contemplated in section 77, subsections (2) and (3). The existence of external walls and windows did not necessarily constitute a building. Speaking for himself, and reserving the right to change his opinion when the point again arose, he was of opinion that section 77 (1) referred to the union of two buildings existing at the time of union, and not to an addition to an existing structure. The appeal must be dismissed.—Mr. Justice Wills and Mr. Justice Channell concurred. Leave to appeal was granted.

Elevation of a Window.

THE FIRE CONGRESS.

Papers to be Read.

THE following are among the papers accepted for consideration and discussion at the International Fire Prevention Congress, convened by the British Fire Prevention Committee, which is to be opened by the Lord Mayor on July 7th:—By G. Edward Atkinson, president of the Boston Manufacturers' Mutual Insurance Co., U.S.A., "The Prevention of Loss by Fire in the United States of America"; by Privy Councillor J. Stubben, late president of the Amalgamated Societies of German Architects and Engineers, late city surveyor of Cologne, "Urban Fire-Protection as influenced by Street Planning and Building Regulations"; by Chief Officer Westphalen, Hamburg City Fire Brigade, "The Latest Experience in Warehouse Construction at Hamburg and Bremen"; by Professor Woolson, Columbia University, New York, "Fire-retarding Wood"; by Chief Officer Meier, City Fire Brigade, Amsterdam, "The Necessary Development of Fire-Alarm Systems"; by Professor Medem, University of Greifswald, "Spontaneous Combustion"; by A. Dittman, Chief Officer, Bremen Fire Brigade, "The Influence of the Fire Service on Fire Prevention"; by A Goldoni, Chief Officer, Fire Brigade, Milan, "Fire Survey and Fire Watches in Theatres"; by Gorham Dana, Inspector, Underwriters' Bureau, New England, Boston, U.S.A., "The Care of Private Fire Appliances"; by Charles Hexamer, president of the National Fire-Protection Association, U.S.A., "The Principles of Fire Insurance in America"; by W. H. Stratton, chairman of Executive of the National Fire-Protection Association, U.S.A., "Fire Hazards in America from an Insurance Point of View"; by W. H. Merrill, junr., The Underwriters' Laboratories, Chicago, "The Testing Principles adopted at the National Fire-Prevention Laboratory of Chicago"; by Crown Surveyor Jaffé, Berlin, "The Testing Principles adopted at the Royal Technical Research Laboratory, Charlottenburg, and at other Fire Tests in Germany"; by Chief Officer Welsch, City Fire Brigade, Ghent, "The Necessity of Systematising Testing Operations as based on Belgian Experience." All application regarding the programme of the Congress and the arrangements made for visitors to the Metropolis should be made to the hon. general secretary, Mr. Ellis Marsland, 1, Waterloo Place, S.W.

In the Royal Hospital for Incurables at Putney a tablet has just been placed to the memory of Dr. Thomas James Woodhouse. It is the work of Mr. Harry Hems, of Exeter.

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, 9, *East Harding Street, E.C.*

Aylesbury.—For additions to Literary Institute. Mr. Fred Taylor, A.R.I.B.A., architect, Aylesbury:—

Hunt & Son, High Wycombe	£1,373	0	0
G. Darlington, Amersham	1,327	0	0
Townsend & Co., London	1,304	17	10
H. Fincher, Tring	1,290	0	0
Webster & Cannon, Aylesbury	1,280	0	0
Mayne & Son, Aylesbury	1,260	0	0
J. Hodges, Edgware	1,232	0	0
G. & T. Cannon, Aylesbury	1,197	0	0

Bristol.—For the erection of new warehouse and offices in Castle Green, for Messrs. Habgood Brothers, metal merchants. Mr. Thomas Scammell, architect, 1, St. Stephen Street, Bristol:—

W. Church	£2,219	J. Perkins & Son	£2,122
J. James	2,200	F. Chown	2,000
Eastabrook & Sons	2,190	G Humphries	1,980
Jones & Hill	2,152	Wilkins & Gosling*	1,880

* Accepted. [All of Bristol.]

Eastbourne.—For the erection of a fire station, Gover Road, for the Corporation. Mr. P. A. Robson, architect, 9, Bridge Street, Westminster, S.W.:—

M. Hookham	£5,059	0
Martin, Wells & Co	4,937	15
Cornwell & Son	4,684	5
F. G. Minter	4,657	0
J. Martin	4,495	0
J. Longley	4,489	0
W. & E. Noakes	4,150	0

Holywell (Flints).—For the construction of a reservoir, supplying and laying of cast-iron pipes, supplying and fixing of pillar fountains, hydrants, valves, &c., for the Holywell Rural District Council. Mr. C. A. Atkinson, engineer, 11 Tithebarn Street, Liverpool:—

J. Jones, Flints	£4,600	0	0
T. Rowlands No thwich	3,776	11	0
W. Jowett, Prescot, Lancs.	3,450	6	4
H. Hughes, Holywell	3,327	12	10
Bennie & Thompson, Warrington	3,133	0	11
R. A. Crowe, Deansgate, Manchester	3,111	14	6
Hughes & Rowlands, Colwyn Bay	2,884	16	0
H. Shardlow, Nottingham	2,860	0	0
W. D. Simmons & Son,* Glan Lyn, Gwersylt, Wrexham	2,671	0	3

* Accepted.

London.—For works at Dunt's Hill School, for the London School Board. Mr. T. J. Bailey, architect to the Board:—

R. A. Jewell	£1,691	E. Triggs	£1,535
J. Marsland & Sons	1,620	J. Garrett & Son	1,46[illegible]
General Builders, Ltd.	1,597	Lathey Brothers	1,407
Whitehead & Co., Ltd.	1,545	W. Hammond*	1,383

* Recommended for acceptance.

London.—For the erection of a special school (mentally defective) at Sussex Road, for the London School Board. Mr. T. J. Bailey, architect to the Board:—

F. & H. F. Higgs	£3,335	0	0
W. Downs	3,195	0	0
T. D. Leng	3,163	0	0
E. Triggs	3,127	0	0
Johnson & Co.	3,122	0	0
R. A. Jewell	3,038	16	1
J. Smith & Sons, Ltd.	3,022	0	0
Martin, Wells & Co., Ltd.	3,012	0	0
E. P. Bulled & Co.	2,997	0	0
J. Garrett & Son	2,951	0	0
Rice & Son	2,951	0	0
Lathey Brothers	2,895	0	0
Stimpson & Co.	2,867	0	0
J. Marsland & Sons	2,840	0	0
J. & C. Bowyer	2,839	0	0
W. J. Mitchell & Son*	2,799	0	0

* Recommended for acceptance.

London.—For the enlargement of Swaffield Road School, for the London School Board Mr. T. J. Bailey, architect to the Board:—

F. & H. F. Higgs	3,210	0	0
W Downs	3,117	0	0
F. G. Minter	3,090	0	0
Martin, Wells & Co., Ltd.	3,043	0	0
R. A. Jewell	3,027	18	5
Marchant & Hirst	2,850	0	0
E. Triggs	2,781	0	0
Lathey Brothers	2,775	0	0
J. & C. Bowyer	2,727	0	0
Rice & Son	2,694	0	0
J. Appleby & Sons	2 666	0	0
Treasure & Son	2,557	0	0
J. & M. Patrick	2,465	0	0
J. Garrett & Son*	2,457	0	0

* Recommended for accceptance.

London.—For relaying the old soil drains and part surface water, and forming the necessary access with several connections to the existing trough latrines; also providing additional lavatory accommodation for girls, at Haselrigge Road School, for the London School Board. Mr. T. J. Bailey, architect to the Board:—

Sanitary Lead-lining and Pipe-bending Co., Ltd.	£1,776	6	0
Rice & Son	1,657	0	0
W. Hammond	1,627	0	0
E. Triggs	1,626	0	0
Lathey Brothers	1,619	0	0
R. P. Beattie	1,587	7	6
Maxwell Brothers, Ltd.	1,580	0	0
J. & M. Patrick	1,577	0	0
J. & C. Bowyer	1,497	0	0
J. Peattie	1,491	0	0
J. W. Falkner & Sons	1,488	0	0
A. Porter	£1,485	0	0
H. Leney & Son*	1,467	0	0

* Recommended for acceptance.

London.—For the enlargement and improvements at Pope Street School, for the London School Board. Mr. T. J. Bailey, architect to the Board:—

Macey & Sons, Ltd.	£13,517	J. Garrett & Son	£11,881
A. Porter	13,251	Martin, Wells & Co., Ltd.	11,697
F. & H. F. Higgs	13,123	Thomas & Edge	11,492
J. Longley & Co.	12,953	J. Marsland & Sons	11,419
E. Lawrence & Sons	12.896	J. Appleby & Sons	11,200
J. Smith & Sons, Ltd.	12,667	T. D. Leng	11.067
General Builders, Ltd.	12,573	G. E. Wallis & Sons	10.943
		J. & C. Bowyer*	10,787

* Recommended for acceptance.

London.—For works at Deansfield Road School, for the London School Board. Mr. T. J. Bailey, architect to the Board:—

Rice & Son	£5,846	T. L. Green	£4,889
Thomas & Edge	5,106	J. Smith & Sons, Ltd.	4,731
Marchant & Hirst	5,075	E. Proctor & Son	4,420
H. Groves	5,030	E. P. Bulled & Co.	4,300
T. D. Leng	4,962	J. & C. Bowyer*	4,160

* Recommended for acceptance.

London, S.E.—For the erection of public baths and washhouses, Old Kent Road, for the Borough of Camberwell. Mr. E. Harding Payne, architect, 11, John Street, Bedford Row, W.C. Quantities by Mr. R. C. Gleed:—

		A.
W Lawrence & Son	£48,300	£2,800
Balaam Brothers	45,000	1,100
B. Nightingale	44.500	2,200
Shelbourne & Co.	42, 10	1,723
Godson & Sons	42 354	736
W. J. Maddison	42,329	1,256
Shillitoe & Son	42,270	970
E. Lawrence & Son	41,975	998
Battley, Sons & Holness	41,757	1,119
C. Ansell	41,500	999
Jones & Son	41,035	—
H. L. Holloway	41,000	955
Holliday & Greenwood	40,644	1,032
Pattinson & Sons	40,133	1,068
Greenwood, Ltd.	40,086	1,000
W. Wallis	39,999	1,500
King & Son	39.792	1,266
Galbraith Brothers	39,675	1,426
Kilby & Gayford	39 633	1,220
A. N. Coles,* Plymouth	37.433	1,630

[A. Extra for Portland stone.] * Accepted provisionally.

London, S.E.—For underground convenience to be constructed in front of the new baths and washhouses in the Old Kent Road, for the Camberwell Borough Council:—

W. Lawrence & Son, N.	£4,400
Battley, Sons & Holness, S.E.	3,997
E. Lawrence & Son, N.	3,993
H. L. Holloway, Deptford, S.E.	3,900
G. Jennings, Ltd., London, S.E.	3 871
G. Godson & Sons, Kilburn Lane, N.W.	3,863
J. Shelbourne & Co., E.C.	3,812
J. Shillitoe & Son, Bury St. Edmunds	3,791
J. Greenwood, Ltd., E.C.	3,781
W. J. Maddison, N.	3,729
A. N. Coles,* High Street, Plymouth	3 600
B. Finch & Co., Lambeth, S.E.	3 3 8

* Recommended for acceptance.

Middlewich, Cheshire.—For the erection of banking premises, Middlewich, Cheshire, for the Birmingham District & Counties Banking Co., Ltd. Mr. Ernest E. Shepherd, architect, Bond Gate, Nuneaton:—

S. Manley	£2,598	0	0
Micklewright & Sons	2,519	0	0
Thomas Smith & Son	2,297	15	8
Birchall Brothers*	2,070	0	0

* Accepted.

London, S.E.—For the erection of higher elementary school, Blackheath Road, Greenwich, for the London School Board. Mr. T. J. Bailey, architect to the Board:—

Thomas & Edge	£12,900	J. Marsland & Sons	11,715
G. Munday & Sons	12,603	Martin, Wells & Co., Ltd.	11.617
W. Gregor & Son	12,521	Johnson & Co.	11,578

W. Downs	11,923		
J. Smith & Sons, Ltd.	11,809		

* Recommended for acceptance.

London, S.W.—For the erection of warehouse in Vera Street, Clapham, S.W., for Mr. E. W. Bonehamper. Mr. Harry J Capell, architect, 20, Lynett Avenue, Clapham Common, S.W.:—

G. Garner	£3,181	12
H. T. Bishop	2,872	0
Turtle & Appleton	2,320	0
Garrett & Son	2,293	0
Somerford & Son,* Clapham	1,988	0

* Accepted.

London, W.—For the erection of the central schools, for the Acton School Board. Messrs. Edward Monson & Sons, architects, Acton Vale, W., and 22, Buckingham Street, Adelphi, W.C. Quantities by Mr. F. T. W. Miller, Dartmouth Street, Queen Anne's Gate, S.W.:—

Barker & Co., Kensington, W.	£31,500
B. E. Nightingale, S.E.	29,300
Hunt & Son, High Wycombe	28,967
Godson & Sons, W.	28,846
Wall & Co, Kentish Town, N.W.	28,647
Kellett & Sons, Willesden Junction, N.W.	28,100
Patman & Fotheringham, W.C.	23,000
Lole & Lightfoot, Chelsea, S.W.	27,957
Dorey & Co., Brentford, W.	27,300
Braid, Pater & Co, Cheapside, E.C.	27,000
W. Wallis, Balham, S.W.	26,999
Dearing & Son, W.	26,973
H. Lovatt, West Kensington, W.	26,750
Gough & Co., Hendon, N.W.	£26,734
W. Blackburn, Chiswick, W.	26,650
W. J. Renshaw, Putney, S.W.	26,296
Galbraith Brothers, Camberwell Green, S.E.	26,295
Hadley & Sons, Old Hill, Staffs	26,000
Willcock & Co.* Wolverhampton	25,685

[Architects' estimate, £27.150.]

* Accepted subject to the approval of the Board of Education.

Londonderry.—For building extension to the electric light station, for the Corporation. Mr. Daniel Conroy, architect, 21, Shipquay Street, Londonderry:—

Smyth Brothers, Waterside	£6 374
Shannon & Routledge, Fountain Street	7,532
M. Sweeney, Strand Road	5,970
R. Colhoun,* Strand Road	5,500

* Accepted.

Norwich.—For erection, completion and maintenance for six months of two blocks of workmen's dwellings in Angel Road, one of such blocks to comprise twelve dwellings arranged in flats, the other block to comprise four self-contained dwellings, for the Corporation. Mr. Arthur E. Collins, M.I.C.E., city engineer, architect and surveyor:—

T. H. Gill	£2,167	0	0
F. R. Hipperson	1,981	4	10
J. Youngs & Son	1.950	0	0
J. S. Smith	1,875	0	0
Burton & Son	1,838	12	4
W. J. Hannant	1,831	0	0
A. C. Taylor	1,830	0	0
Lincoln & Bush	1,822	0	0
S. Chapman & Son	1,799	0	0
Southgate Brothers	1,770	0	0
H. C. Greengrass	1,740	0	0
A. D. Boddy & Son*	1,730	0	3

* Accepted. [All of Norwich.]

Scarborough.—For the construction of the approach road to the Marine Drive, including concrete viaduct, harbour walls, slipway, drainage, &c., for the Scarborough Town Council. Messrs. E. T. Beard, A.M.I.C.E., F.S.I., and Harry W. Smith, A.M.I.C.E., engineers, Town Hall, Scarborough:—

Dixon & Co., Bradford	£15,990	0	0
H. Arnold & Son, Doncaster	14,750	0	0
Parker & Sharp, York	12,451	3	10
R. C. Brebner & Co., Edinburgh	11,623	7	8
J. Brunton, Hull	11,617	16	9
A. Graham & Son, Huddersfield	11,170	0	0
A. Brunton & Son, Hull	11,083	11	4
G. Bell, Manchester	10,143	12	2
J. Jaram & Son, Scarborough	10,005	0	0
G. K. Waghorn, Gilberdike, Yorks.	9,670	0	0
B. Cooke & Co.,* 16, Victoria Street, Westminster, S.W.	8,500	0	0

* Accepted.

Shoeburyness.—For the erection of an infants' school (to accommodate 200 children), together with the necessary offices, &c., at Richmond Avenue, Shoeburyness, for the South Shoebury School Board. Messrs. Burles & Harris, architects, Clarence Chambers, Southend-on-Sea:—

G. Ventris, Shoeburyness	£4,630	0
J. Dowsett, Southend-on-Sea	3 998	15
Dowsing & Davis, Romford	3,930	0
A. J. Golding, Southend-on-Sea	3,875	0
Whur & Campkin, Southend-on-Sea	3 850	0
Dupont & Co., Southend-on-Sea	3,785	0
F. & E. Davey, Ltd., Southend-on-Sea.	3,779	0
S. E. Moss, Southend-on-Sea	3,655	10
Davis & Leaney, Southend-on-Sea	3,649	0
A. R. Whur, Southend-on-Sea	3,590	0
J. Alp, Shoeburyness	3,496	0
E. West, Chelmsford	3,479	0
W. E. Davey, Southend-on-Sea	3,244	0
Harrris & Rowe,* Ltd., Shoeburyness.	3,198	0

* Accepted.

Sidmouth (Devon).—For alterations and additions to the Knowle Hotel, Sidmouth, Devonshire. Mr. R. S. Balfour, A.R.I.B.B.A., architect:—

Kilby & Gayford, London	£14,126
Holloway Brothers, London	13,716
Cowlin & Sons, Bristol.	13,300
J. Marsland & Sons, London	13,295
Stephens, Bastow & Co., Ltd., Bristol	12,886

EYRE & SPOTTISWOODE'S

ELECTRUM BEAM COMPASSES,

With Tangent Screw Adjustment and Needle Points, in Neat Cloth Case, 12/- per set.

HAND-MADE WHATMAN'S DRAWING PAPER.

IMPERIAL, 5d. per sheet; 9/6 per quire.
DOUBLE ELEPHANT, 1/- per sheet;
21/- per quire.

DRAWING INSTRUMENTS, SCALES, OF EVERY DESCRIPTION.

"RECORD"
TRACING CLOTH,
Supplied in Rolls of 24 Yards.
30 in., 16/-; 36 in., 19/-; 40 in., 23/-; 42 in., 26/- per Roll.

ENGINEERS' DRAWING BOARDS,
One Edge inlaid with Ebony. Best finish.
Sizes, 23″ × 16″, 7/-; 28″ × 19″, 9/6; 32″ × 23″, 12/6; 42″ × 29″, 16/-; 54″ × 32″, 28/- each.

Complete Catalogue supplied free on application to EYRE & SPOTTISWOODE, GREAT NEW STREET, LONDON, E.C.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

June 3, 1903. Vol. 17, No. 434. 9, East Harding Street, E.C.

The Strand "Island." SINCE we referred, three weeks ago, to Mr. Hamo Thornycroft's suggestion for cutting off the eastern corner of the Strand "island," or crescent, several other modified schemes have been put forward, but, in the main, Mr. Thornycroft's idea has been preserved. Mr. Emden has insisted that the crescent frontage should be regarded in its entirety, and that by cutting off a portion of one end its symmetry would be destroyed. Mr. Thornycroft, however, points out that one does not regard the scheme from a balloon, and that when actually on the ground the two ends of the crescent could not be regarded at the same time; and he reverts to his original contention that, as laid out, the church of St. Clement Danes will not be properly seen from the west and that the line of the Law Courts will be lost until one arrives "at the turmoil at the corner of Aldwych." Mr. Belcher offers a modification of Mr. Thornycroft's plan, and Mr. Mark H. Judge suggests an island pavement between the two churches; but it all seems to no purpose, for at last week's meeting of the London County Council the proposal was not favourably received and the valuer presented an ingenious but misleading estimate that the ground was worth an annual rental of £12,000, representing a capital sum of £360,000. It has been observed that amateur alterations made at the last moment after the lines of an improvement have been maturely considered can only have a mischievous effect, of which there is a conspicuous example in the alteration made by a Committee of the House of Commons in the plan of Northumberland Avenue, which was very detrimental to the gradients as arranged by the engineer to the Metropolitan Board of Works; but Mr. Thornycroft has shown very clearly that his idea is an admirable one. We notice that the Council has allowed itself to be persuaded by Mr. Emden to reject the major part of its Committee's recommendation about the letting of plots on the "island" and the erection of buildings thereon. It was recommended that the elevations of the buildings fronting the Strand, Aldwych and Kingsway should be carried out in Portland stone, marble or granite, and should be "of such design as the Corporate Property Committee of the Council shall approve as worthy of the position." Then came the following important provisoes, which Mr. Emden managed to get rejected by 51 votes to 42, as well as securing the addition of brick to the materials of construction: "Provided that if the design for the elevation submitted by the lessee shall not be approved by the Committee, the lessee shall submit a new or amended design, and for that purpose shall be at liberty to retain, either alone or in association with any other architect, any one of the following architects, namely, Mr. H. T. Hare, Mr. William Flockhart, Mr. Mervyn Macartney, Mr. Leonard Stokes. And if the Committee does not approve of such new or amended design and cannot agree with the lessee upon any satisfactory amendment thereof, the designs submitted by the lessee shall be referred to the Senior Architectural Royal Academician for the time being willing to act, who shall determine whether the designs or either of them submitted by the lessee are or is worthy of the position, and the costs of the reference shall be in the discretion of the referee; and in case the referee shall determine that the designs are not worthy of the position the lessee shall submit new designs for approval of the Committee, and in case of difference thereon they shall be submitted in like manner to the aforesaid referee." In view of the fact that the Council's competition was a fiasco, we think it very regrettable that these provisions should have been rejected. Mr. Emden can congratulate himself for having secured this result: we are sorry we cannot congratulate him on the architectural design which he has displayed as the first building on Aldwych.

* * *

The Liverpool Cathedral Decision. WITH all due respect to Mr. Bodley, we can hardly suppose that the last decision of the Liverpool Cathedral Executive Committee has met with approval among architects. Once more the Committee have changed front in face of hostile public opinion. We must be thankful that they have at least accepted Mr. Scott's design, so preserving the worth of the competition, but there is no reason why they should have appointed Mr. Bodley as collaborator. Mr. Scott may be a young man, but he has proved his ability in the design selected. Mr. Bodley is well on in years and has long since been settled in his treatment of architecture. There is a great difference between the Gothic of the two men; each claims its own individuality; and we should not consider it fair to Mr. Scott if his design were to be altered by the hand of another.

The Registration Problem. MR. SILVANUS TREVAIL'S propaganda has brought forth another outburst about the registration of architects; the same question that has been periodically revived for the last twenty-five years, and one about which opinion is as diverse and as prejudiced as ever. This is not surprising when the difficulties of the problem are realized. If there were nothing but construction to consider the matter might have been settled from the first, but it is the art issues which hedge the scheme with difficulties. The pros and cons have been discussed over and over again, but generally from either one extreme or the other. Let the most recent expressions of opinion be considered. Prof. Beresford Pite says that the registration of architects would not effect any public benefit. Mr. T. G. Jackson holds that those artistic qualifications which differentiate the architect from the builder cannot be tested by examination; that a diploma of architecture would have no value; that it would separate architecture still more from the sister arts; and that "no legislation can protect the public from bad design, nor could legislation help to prevent bad construction unless builders and all others who erect buildings were required to pass the test of examination as well as architects, inasmuch as architects are not employed in the majority of cases." Mr. Reginald Blomfield says the leading architects of the day are opposed to the scheme, as making confusion worse confounded. Of course, on the other hand, Mr. Trevail, Mr. Seth-Smith, Mr. Emden and others contend that registration would not fetter the architect in his art, that it would protect the public, and that, moreover, it is already established in other countries. We have not the space nor the desire to again enter into the by-paths of this matter. Let each architect think for himself. Let what can be settled be settled as a thesis: for instance, that it is impossible to examine a man in his "art," though you may test his knowledge of art history: and then arises the question as to whether too much stress is laid on the historical side. There are "F.R.I.B.As." who have undertaken their studies, but whose designs are atrocious, just as there are good designers who have very little knowledge of art history. Taste is largely governed by good training: with the opportunities for such training so scarce as they are in this country it seems that we are hardly yet ready for a Registration Bill.

EGYPTIAN ARCHITECTURE.*

THE BEGINNINGS OF THE STYLE.

By Prof. Sir MARTIN CONWAY.

THE Egyptian style appears to have arisen about the time of the Fourth Dynasty, and to have rapidly developed during the Fifth. Its elements existed earlier, but not till the Fourth Dynasty were they definitely compounded into an architectural style applicable to buildings in stone. Until recently it was commonly believed that the early dynastic Egyptians employed wood for small and costly edifices. In fact, however, no such Egyptian wooden architecture ever existed. Pictures and models which survive do look like representations of wooden structures—indeed, some of the slender columns depicted have more the appearance of metal than wood. It must be remembered that unpractised architectural draughtsmen, though for their day able artists, invariably represented columns with exaggerated slenderness. Numerous examples exist in the wall-paintings of Roman Italy; as a special illustration may be mentioned Giotto's painting of the façade of the Temple of Minerva at Assisi.

The columns that represent tent-poles and the octagonal, or sixteen-sided, columns of the hieroglyphs were originally of wood. The rest were of reed-bundles plastered over with mud. Both kinds had been copied into stone at the date of the pictures referred to, and those pictures may actually depict stone buildings, little though they suggest that material.

The earlier Egyptian stone buildings had no architectural features whatever. It was mere building, not architecture. The chapel excavated by Professor Petrie was the simplest kind of stone building conceivable. The neighbouring mastabas were similarly destitute of architectural quality; their false doors were inscribed with beautiful hieroglyphs, but there was no attempt to arrange them architecturally.

Down to the middle of the Fourth Dynasty, then, the craft of building in stone had been carried to a high degree of perfection, but it had developed no architectural art. Buildings whose forms and features were determined by the desire to give pleasure to the eye were only carried out in the old materials of mud and reeds, with which the Egyptians had been familiar from the earliest prehistoric days.

Sir Martin described the characteristic features of a stone building in the developed Egyptian style. The walls have an external batter, are surrounded or edged by the torus moulding, and are crowned by the Egyptian gorge. The supports are either piers—square, octagonal, or sixteen or more sided—or clustered columns made in imitation of bundles of papyrus-stems or reeds, with a flat circular stone for base, and a capital made in imitation of a group of flowers, buds or palm-fronds. There are porticos and halls of columns, and there are dark chambers and passages. Only the piers, the porticos and the halls of columns can have descended in direct sequence from the early stone buildings, and it is not to be supposed that such elements were lacking in contemporary or even prehistoric mud buildings. It may therefore be safely declared that all the features and principles of Egyptian architecture were invented by the mud-builders and were afterwards directly translated into stone. The outward batter of the walls of stone buildings had no meaning in stone; it was borrowed from mud-brick. The Egyptian gorge copied the old fringe of palm-frond tips with which mud walls once habitually terminated. The torus moulding was a translation of the bundle of reeds that protected the tender angle of termination of a mud wall.

Discussing the question as to when this translation took place, and in what kind of building, Sir Martin said that the well-known sarcophagus of Khufu-ankh at Cairo throws a welcome light upon the problem. It represents a palace apparently built of crude brick with wooden fittings. The vertical grooving along the top of the lower part was doubtless intended to represent the gorge. If at that time the gorge had actually begun to be imitated in stone as a cornice to stone buildings, the mason who carved this sarcophagus would have known better than to represent it by flat grooving. The fact that he flattened it seems to prove that, though at the time the gorge was in common use as top member of a crude brick building, it had not yet taken its place in stone building. The sarcophagus of Menkaura, as compared with that of Khufu-ankh, shows a development. Like the latter, it imitates a building usually said to be of wood, but really of mud and reeds, or mud-brick, perhaps, with wood fittings. This building is surmounted by a fully-developed gorge cornice, whilst each façade is surrounded by a torus moulding. Here, then, is the Egyptian style completely formed. It must have sprung into existence between the days of Khufu and Menkaura.

The Fifth Dynasty has left us several actual examples of stone architecture containing decorative features, such as a mastaba at Sakkara, where the architrave of a portico is decorated with a stone gorge rather tentatively employed. The Fifth Dynasty tomb of Ptah-Shepses at Abusir, excavated in 1893, when fragments of lotiform capitals and columns were brought to light, yielded results of the highest importance for the present enquiry.*

The tomb was approached by a great court, which was surrounded by a colonnade of twenty square piers. At the end of the great court was a porch of two columns, of which only fragments remain. In a lateral chamber, which contained the statues of the deceased, were fragments of the two columns that had supported the roof. The base and lower portion of the shaft of one were in place, and enough fragments of a capital were found to enable a complete restoration to be made. Column and capital in each case were hewn out of a single block of limestone. The circular base is simply bevelled off at a slope of about 45 degs. Its diameter is large in proportion to that of the shaft. Such large bases were required when they were used instead of a foundation to spread the pressure of a shaft over an area of ground large enough to support it. This column and capital are, beyond question, the finest that have come down to us from ancient Egypt, as far as workmanship and carving are concerned. The proportions of the capital are excellent. The abacus is a thin rectangular tablet. In the Middle Empire it was made thicker. It is only by comparing these Abusir fragments with later examples of the Lotiform order, such as the Middle Empire rose granite column in the British Museum, that its surpassing merit becomes obvious. The conclusion may be justified that the Memphite architecture of the Fifth Dynasty was highly meritorious, and may have been the finest ever produced in ancient Egypt, or even in the world before the great days of Greece. The date of the Abusir column is about 3600 B.C.

The pyramid field of Abusir is being systematically explored by the German Oriental Society. They have already laid almost entirely bare the Pyramid Temple of the Fifth Dynasty king, Ra-en-user, which is earlier in date than Ptah-Shepses' tomb. In Ra-en-user's temple the gorge cornice and the colonnade of clustered columns were fully developed. The courts were floored with basalt. In the great court was a red sandstone cistern to catch the rainwater. A drain led this out to another red sandstone cistern. The base of the walls was also of basalt (in places of granite) which explains the black-painted dado so frequently found in tomb chambers of the Old Empire. The walls, above the basalt foot, were all covered with fine plaques of white limestone, delicately carved and painted, of which only fragments remain. The side posts of the magazine doors were of red sandstone. The only fragment of sculpture found was a noble head of a colossal granite lion. There were also remains of an alabaster altar embellished with reliefs of the various nomes.

Throughout the period when true stone architecture was arising in Egypt pyramid-building steadily lost its charm for the kings. Khafra's pyramid was smaller than Khufu's, Menkaura's than Khafra's; their successors were yet smaller. The reason evidently was because, as time advanced, less of the mass of human energy under the command of the king was devoted to pyramid building, and more to building of some other sort.

Sir Martin Conway next considered the character of the divine temples of the Old Empire. Fragmentary remains prove that Khufu and Khafra built temples of granite. The shrine was the chief feature, and its fossilized likeness is preserved as the Holy of Holies of almost every later temple. All of them possess one marked characteristic. Entering through the great pylon, and proceeding inwards from court to court and from chamber to chamber, there is a steady diminution in height the further you advance. The reason for this is plain. The normal temple plan resulted from a series of accretions. An Ancient Empire shrine received additions, mostly in front, in the Middle Empire, and successive further additions in the New Empire. Often the old parts were ruinous, and had to be rebuilt, but, according to the general Egyptian way of doing things, the habit was to reconstruct the old parts on the old scale, and as far as possible in the old style, and to add the new parts in the new style. The Middle Empire built on a larger scale than the Ancient Empire, the Eighteenth Dynasty on a larger scale than the Middle Empire, and the Nineteenth larger than the Eighteenth. Thus a big temple, resulting from the accretions of various building periods, naturally grew in scale from shrine to pylon, and this feature was adopted into the style of temple design, so that even a wholly new temple was built in that fashion. From these considerations we may safely conclude that the Ancient Empire temples were small in scale. The best of them, the important royal temples, were probably built of the hard and precious rocks, such as granite, diorite, porphyry and alabaster. We have every reason to conclude that all the later types of column and capital were fixed at this time. The lotiform, palmiform and campaniform or papyrus orders are all represented in the painted reliefs of the Ancient Empire.

Describing the Fifth Dynasty divine temple revealed by the recent German excavation, Sir Martin said that it was built near the Abusir pyramid field by the King Ra-en-user in honour of the sun-god Ra. Instead of a shrine its chief feature was an obelisk raised on a massive base covered with great blocks of granite at the foot and with fine white limestone above. The outer walls were built of big blocks of hard yellow limestone. The inner walls were badly built, but covered with plaques of finest limestone carved with delicate reliefs above a dado painted black. At important points the base of the decorated walls was of granite. The ceilings were painted with yellow stars on a blue ground. The relief carvings were admirable, in the style of the best reliefs in the almost contemporary tomb of Ptah-hotep.

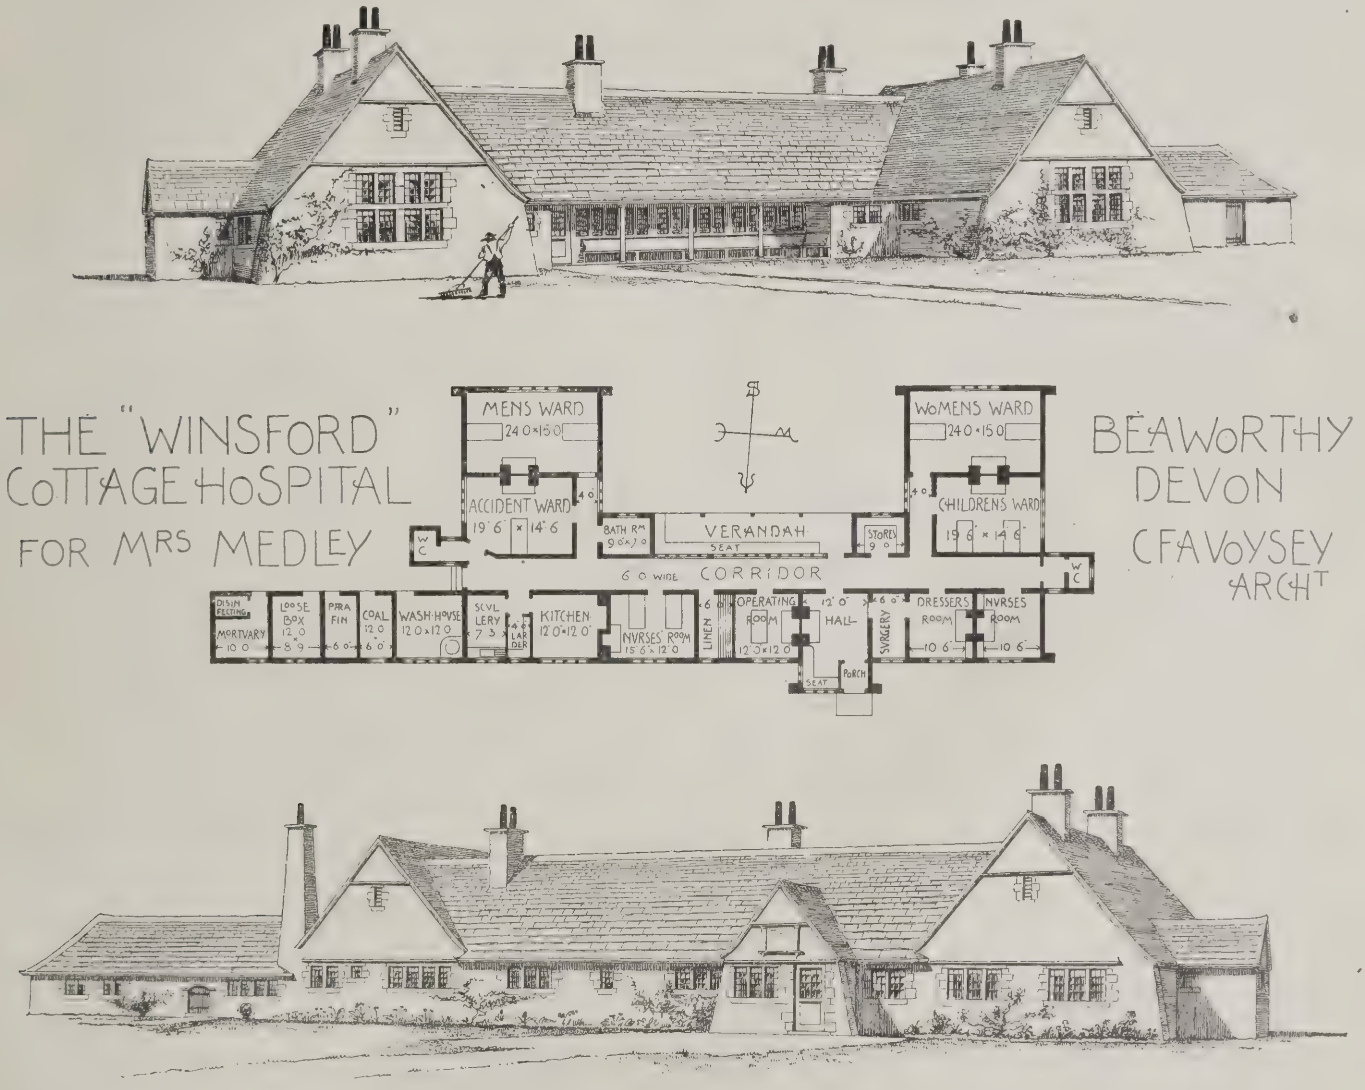
---

* Abstract of a paper read before the R.I.B.A. on May 18th, 1903.

* Sir Martin Conway eulogised Mons. G. Foucart for his labours in connection with this important find, and passed high encomiums upon his "Histoire de l'Ordre Lotiforme."

Sir Martin Conway referred to the evolution brought about in temple-building by changes in religious ceremonial, and by the gradual ousting of the laity from the temple services, and the rise of the priestly caste. Finally he considered the character of the sculptured decoration applied to Old Empire temples, and the system of its distribution. No Egyptian sculpture in the round ever surpassed that of the Fifth Dynasty. The mural decorative sculpture of the Old Empire was correspondingly excellent as far as it went, but it suffered from a great defect that sculpture in the round escaped. It was governed by faulty Egyptian perspective. A figure in the round could be absolutely copied from Nature, but a figure in low relief could only be truthfully represented by the aid of conventions not yet invented. Quality of surface is the great test of bas-relief. The best Fifth Dynasty work in this kind is sometimes good, though seldom to any high degree. The best result is attained when the artist treats vegetable forms, especially thick growths of lotus and other luxuriously growing plants. It is evident that he relied strongly upon colour for decorative effect. Where the colours have survived an excellent effect is obtained. The Egyptians attained to perhaps the most perfect apprehension of how to design and carry out a decorative scheme in one logical style ever attained by any people. Every form they employed, whether in their architecture or their sculpture, their paintings, their writing, their decoration of every object large or small, employed for whatever purpose, was the consistent outcome of a single artistic ideal. All parts, therefore, harmonized together.

Egypt has impressed the prestige of its mighty name as a country of great buildings and noble art upon the imagination of succeeding generations. We are only now beginning to realize that the reputation of Egypt as an ancient artistic nation, so far from being exaggerated, does not attain the level it deserves.



A COTTAGE HOSPITAL.

THE cottage hospital at Beaworthy, in Devonshire, illustrated on this page, is built of brick cement rough-cast, with Delabole slate roof, local grey stone window dressings and iron casements. The passages and verandah are paved with yellow vitrified Dutch tiles, and the floors of the wards are boarded on solid beds of concrete, so that there is no cold damp air or any harbour for rats below. The site is elevated and very much exposed to all weathers, and has a view to the south only. Cross-ventilation is provided in each ward by means of separate air-flues. The windows in the two main wards are placed towards the view and the sun. The children's ward looks over the railway, which is the only entertainment near the site. "I mention these points," says Mr. Voysey, "as the hospital faddists are apt to forget them."

Law Cases.

Unnecessary Notice asked for by Sanitary Authorities.—At the Worship Street Police Court on May 20th the case of *Cook* v. *Fulford* was heard. This was a summons by the borough council of Stepney against a builder for penalties for fixing a new w.c. basin and trap without previously giving notice to the clerk to the borough council. Mr. Alfred Cook, one of the sanitary inspectors, cross-examined by Mr. Brewster, solicitor for Mr. Fulford, said the borough council had had the drainage at Lamb Street under their notice since March, but he was not aware that the sewer into which the house drained was choked. He admitted serving the notice, dated April 29th last, requiring a choked and defective w.c. to be put right. He contended that though Mr. Fulford had put in the new w.c. it was necessary for him to give notice to the clerk to the borough council before carrying out the work. The basin and trap were properly fixed. At this point Mr. Brewster submitted that the by-law did not apply to a matter of this kind, and that it only provided for notice being given when an owner intended to do work on his own initiative. In the present case the owner was served with an order to put in a new w.c. The by-law was obviously intended to prevent work being done without the knowledge of the sanitary authorities, and in the present case the sanitary authorities must, if they did their duty, inspect, and after inspection they had admitted everything was properly done.—The magistrate dismissed the summons.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Stopping for Terra-Cotta.

SWINDON.—W. B. writes: "Is there any special kind of stopping for joints of terra-cotta work?"

Coloured Portland cement is generally used, and is probably the best material.

Rainwater for Domestic Purposes.

LONDON, S.W.—PAL writes: "(1) Could you tell me of any building in or around London where the rainwater is used as a domestic supply—I mean for supplying lavatories and w.c.'s? (2) Kindly name a book dealing with this subject."

(1) We are unable to mention any building of importance in or near London that utilizes its rainwater in the manner mentioned, as it is generally much more convenient to obtain the whole of the water supply—both for drinking and sanitary purposes—direct from a public company. Possibly Mr. Roberts, Haslemere, Surrey, who is the manufacturer of a rainwater separator, may be able to furnish you with such an address. (2) See Colyer's "Modern Sanitary Appliances," price 5s., published by Messrs. E. & F. N. Spon, Ltd., 125, Strand, London, and "Specification, No. 6," price 5s., published at these offices. T. E. C.

Radius of Gyration.

MANCHESTER.—Bosco writes: "Taking stock section from Messrs. Dorman Long's catalogue, say 20in. by 7½in. by 89lbs., the least moment of inertia being given as 70·63 and sectional area as 26·2 sq. in., there is for the radius of gyration

$$\sqrt{\frac{I}{n}} = \sqrt{\frac{70\cdot63}{26\cdot2}} = 1\cdot64.$$

Assuming this stanchion to be of unlimited length and supporting ends of beams at various intervals, how do these beams affect the radius of gyration? Is there any simple rule that may be worked to, without the laborious calculations that would be necessary to obtain accurate results?"

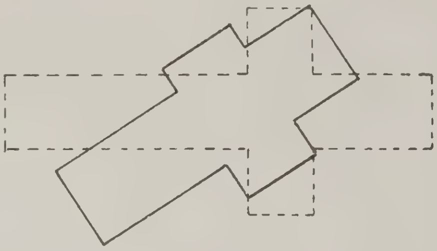
The radius of gyration remains the same so long as the bending of the stanchion takes place in the same direction. When a stanchion supports a girder at one side it is a non-axial load, and there is no very simple means of calculating the effect. The procedure is as follows: Let w = non-axial load in tons; d = distance of centre of pressure from centre of gravity of section in inches; A = area of cross-section in sq. in.; S = maximum stress in tons per sq. in.; D = distance of point of maximum stress from neutral axis in inches (generally half diameter); I = moment of inertia of section. Then

$$S = \frac{w}{A}\left(1 + d\frac{DA}{I}\right).$$

This, added to the mean stress produced by a central or axial load (if any), must not exceed the greatest safe stress permissible upon the stanchion according to Gordon's or Fidler's formulæ. When a stanchion supports two or four girders on opposite sides at the same level, the loading is symmetrical and the primary formula (Gordon's or Fidler's) alone is needed. When two girders are supported at the same level, but on adjacent sides of the stanchion, as at the angle of a building, the effect of each should be calculated separately by the above formula and the results added together. Much information on these points may be gathered from "Designing Ironwork," 2nd Series, Part II. (Spon, 2s. 6d.). HENRY ADAMS.

Old St. Paul's.

LONDON, S.E.—S. D. T. writes: "In Gwilt's 'Encyclopedia' there is a block plan of St. Paul's showing also the position of the old cathedral. The latter evidently lay east to west, but the former, I think, does not. Why was the present building not erected parallel to the old?"



Referring to the accompanying sketch, the dotted line represents the plan of Old St. Paul's, the black line that of the present building. Wren is said to have altered the orientation because of the fracture of the soil. He thought some parts of the original site were rather shaky.

CANON BENHAM.

Preservative for Zinc Flat.

OXFORD.—C. W. L. writes: "Is there any preparation that can be applied to a zinc flat, to stop the effect of weather, &c.?"

The only thing we can suggest is tar or paint.

Photographing Abroad.

MALDON.—W. J. P. writes: "I am going on a tour up the Rhine, and I intend to take a hand camera with me. Do the authorities in Holland, Germany or Belgium object to cameras?"

No, not when used for such purposes as yours.

External Fire-Escape.

WEST EALING.—J. G. writes: "I want to know the proper size of H-rolled steel joist to use as a column in a staircase outside a building, which would be used in case of fire by a good number of people. I send sketch (not reproduced)."

If the joints and details are properly attended to and the usual bases put to the stanchions, the dimensions shown on sketch will give sufficient strength. You must be satisfied with this information. You cannot expect to be taken step by step through the method of designing and calculating such work, as experts have to do this for a living.

HENRY ADAMS.

Scratches on Glass Windows.

SWINDON.—W. M. writes: "Is there any way of treating scratches on plate-glass windows? The windows in question have been badly scratched by painters while cleaning off the old paint."

The only thing we can suggest is to get a glass polisher to rub the scratches down. They may be rendered less noticeable by brushing over them with hydrofluoric acid, or even by varnishing.

Payment for Plans Prepared but not carried Out.

GLAISDALE.—SUBSCRIBER writes: "(1) What could I claim as payment for preparing plans and specification of villas for which tenders were advertised, the lowest being £1,650? I traced five copies of the plans and wrote five copies of the specification. (2) Also, what could I claim for preparing another set of plans, for which the lowest price was £1,400? My client is not proceeding with either of the plans, and, in that case, whose property are the drawings and specifications?"

(1) £60. (2) Three per cent. on estimate, viz., £42. In the case of *Ebdy* v. *McGowan* (reported in the "Times" for November 17th, 1870) it was decided that where the works were not proceeded with the employer could claim the plans upon payment of the architect's fees. We have several times given our reasons for not believing that this would be upheld in a higher court, as it is contrary to the principles of equity. The point needs deciding, but until it is a clause should always be placed in the specification and on each plan to the effect that they are the property of the architect, and the client should be given to understand so from the start.

Books to Study for Position of Builder's Foreman.

READING.—H. J. D. writes: "Having served some time in a builder's yard as a joiner, I wish to improve myself. I am thinking of going as a builder's foreman on a building. Please recommend the proper books to study."

"Specification, No. 6"; "Building Superintendence" by T. M. Clark; Rivington's "Notes on Building Construction;" (For prices see our No. 1 Book List.)

Timbers.

BRADFORD.—J. B. writes: "Please recommend a good cheap book on timber, giving the various varieties and the ports from which they are exported."

W. Richardson's "Practical Timber Merchant" and G. S. Boulger's "Wood" (see our No. 1 Book List.)

Books on Stresses and Stains and Greek Mouldings.

HIPPERHOLME.—PROBATIONER writes: "Please name a book on stresses and strains suitable for the R.I.B.A. intermediate examination; also one on Roman and Greek mouldings and their enrichments."

G. A. T. Middleton's "Stresses and Thrusts" (to be obtained from the Publisher, Technical Journals, 6, Great New Street, E.C., price 5s. post free), and Spiers's book on the Orders (see No. 2 Book List, p. xi).

Ancient Lights.

READING.—H. J. D. writes: "How long must a window be in existence to become an ancient light?"

For nineteen years and a day.

Sanitary Surveyorships.

SOUTHAMPTON.—W. R. writes: "I desire to qualify for the position of surveyor and sanitary inspector. What books should I study?"

"Sanitary Inspector's Guide," by H. Lemmoin-Cannon (price 3s. 6d.); "Municipal and Sanitary Engineer's Handbook," by H. Percy Boulnois (price 15s.); "Sanitary Engineering," by Colonel E. C. S. Moore (price 32s.); "Sanitary Engineering," by Frank Wood (price 8s. 6d.): "Construction of Roads and Streets," by H. Law and D. K. Clark (price 6s.); and "Specification," Nos. 5 and 6 (price 5s. each; 6s. in cloth, postage extra). All these books can be obtained post free, except where otherwise stated, from the Publisher, Technical Journals, 6, Great New Street, E.C.

Buildings to Measure in London.

LONDON.—G. M. T. writes: "Kindly name some buildings in London suitable to measure for the R.I.B.A. What is the best way to take undercut mouldings? Where can I find a description of the cymagraph?"

The following London buildings are suggested by the R.I.B.A. in the particulars of prizes and studentships for 1904:—St. George's, Hanover Square; The Confessor's Shrine and the Tomb of Edward III., Westminster Abbey; All Hallows, Barking; The West Portico of St. Paul's Cathedral; The Wellington Monument, St. Paul's Cathedral; and St. Mary-le-Strand. We could also recommend All Hallows, Lombard Street, which may be pulled down shortly, and of

Gibbs and Flockton, Architects.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

which measured drawings would then be valuable. A description of the cymagraph is given in Spiers's book on Drawing (see our No. 2 Book List on p. xi).

London, S.E.—H. H. writes: "Please suggest one or two buildings of easy access in London (south preferred) suitable to measure for the R.I.B.A final examination. Suppose that I took St. Mary-le-Strand, how could I best measure the side elevations, as the traffic on both sides would make it difficult to work with a ladder, which would have to stand on the very narrow pavement?"

See the foregoing answer. We see no reason why you could not use a ladder at the church of St. Mary-le-Strand early on a Sunday morning. If there is no other way, you might use a theodolite. See an answer to an enquiry on measuring buildings on p. 189 of our issue for April 10th, 1901; articles on pp. 14 and 31 of our issues for August 20th and 27th, 1902; and Spiers's book on Drawing.

Ancient Lights.

In Doubt writes: "A was the owner of a building in which were three windows receiving light over property belonging to B for forty years without interruption. Ten years ago A pulled down his building and at once erected new property. The front wall was advanced about 3ft. The new building has ten windows, three of which occupy practically the space of the old windows, but in an advanced position, as was the case in *Scott* v. *Page*, heard February 9th, 1886. Six years ago B approached A in regard to an agreement as to the ten windows; this, unfortunately, A agreed to. A was to be allowed to enjoy the light passing to the windows, subject to a rent of £2 per annum as an acknowledgment that the lights were enjoyed by permission of B and not from any right actual or acquired. The agreement can be terminated by either party on giving six months' notice. B has now given notice to A and threatens that unless a very much increased rent is paid he will obstruct the windows in question. Can this agreement, under the above conditions, be made void and A be able to retain his right of light to his three ancient windows, as was the case in *The Plasterers' Co.* v. *The Parish Clerks' Co.*, 20 L.J. Exch. 362, heard in 1851, when it was held that payment of rent was not an interruption under the statute, but that there must be an actual discontinuance of the enjoyment by reason of an obstruction submitted to for a year?"

In this case there is not only a payment of rent but a definite written agreement containing a definite written admission on A's part that the lights were at the date of the agreement enjoyed by permission only and not by right. This is an admission that the new windows stand upon a different footing to that of the old ones, and is a distinct abandonment of any claim based upon the old ones. The new windows have not existed long enough to have acquired any rights. In my opinion, therefore, A is completely in B's power, but it is my own opinion only, and may not be the opinion which the Courts would hold if the matter went to trial.

G. A. T. M

Clerks of Works Examination.

Bournemouth.—Clerk of Works writes: "What steps are necessary to obtain permission to sit at the above examination?"

The examinations are held by the Carpenters' Company, and particulars may be had on application to the Clerk to the Company, Carpenters' Hall, London Wall, E.C.

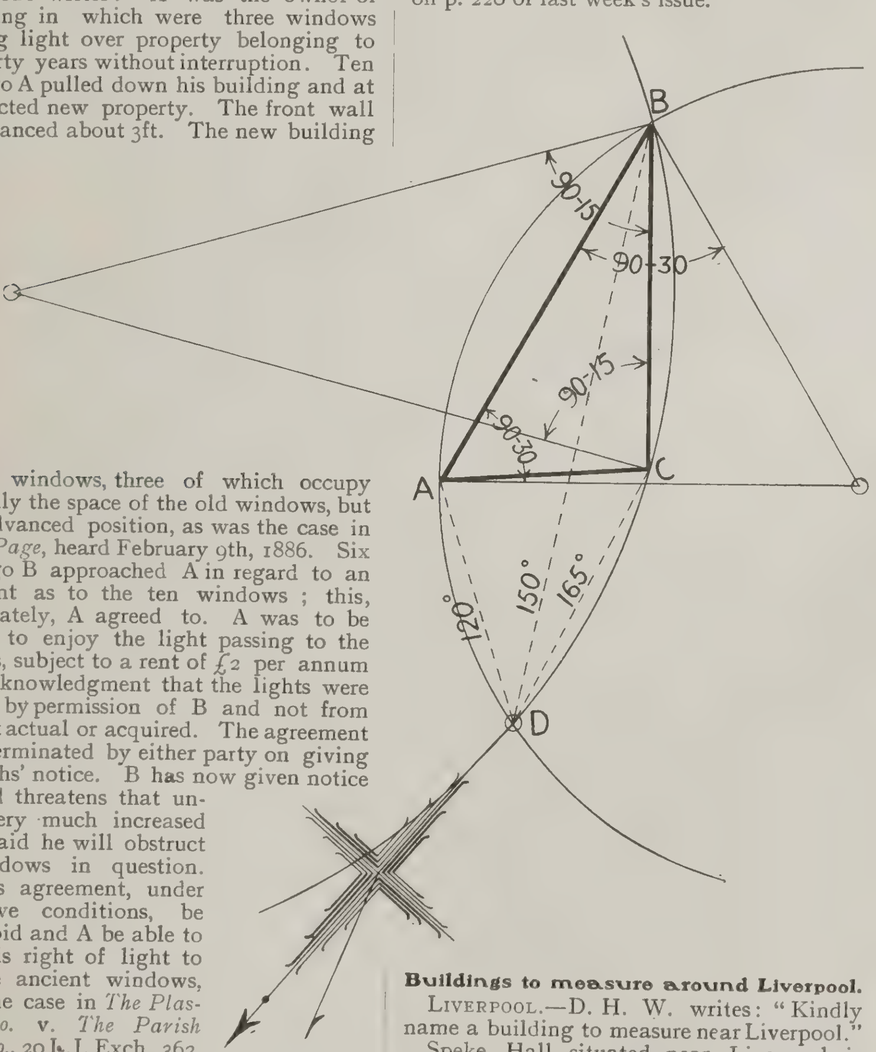
Entasis on Column.

Iron Bridge.—Bee writes: "What is the rule for finding the proper entasis on a column?"

See an answer to an enquiry on p. 393 of our issue for January 24th, 1900, and Mr. R. Phenè Spiers's book on "The Orders" (see our No. 2 Book List on p. xi).

Problem in Land Surveying.

The diagram below illustrates the enquiry on p. 220 of last week's issue.



Buildings to measure around Liverpool.

Liverpool.—D. H. W. writes: "Kindly name a building to measure near Liverpool."

Speke Hall, situated near Liverpool, is perhaps the most complete and least altered half-timbered house in the district. Built at the close of the sixteenth century, it was formerly surrounded by a moat. The arrangement of the house is that of a hollow square, a corridor running round the inside. The great hall is a fine apartment with flat ceiling and curious Renaissance wainscotting. Rufford Old Hall, situated near Ormskirk, retains but a very small portion of the ancient house, but it contains without question the finest great hall in the county. The roof is of considerable beauty, with great richness of detail; beneath the arch at the east end is a massive oak screen, richly carved and of early date. The carving of the door-heads, bosses and panels deserves particular notice on account of its freedom and variety.

M.

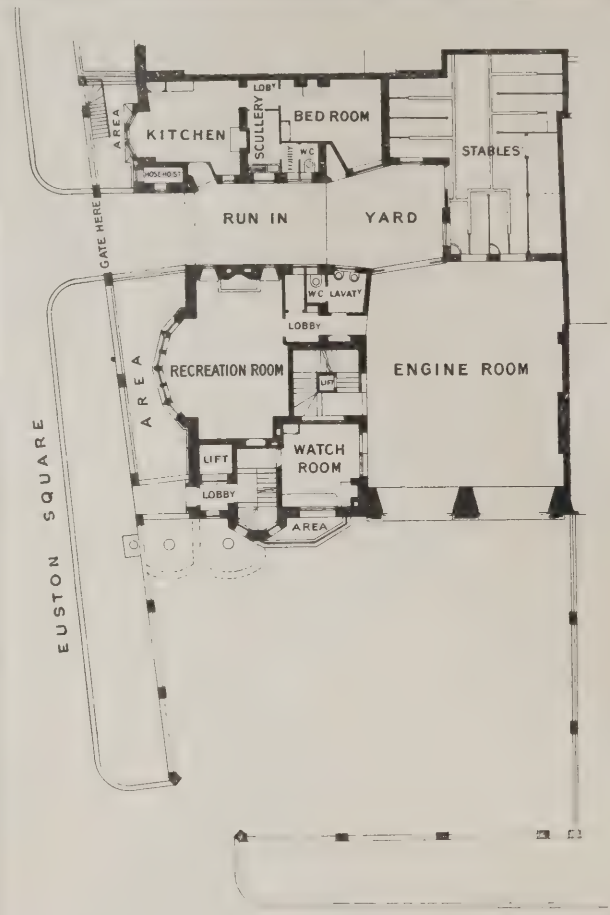
Bricks and Mortar.

Aphorism for the Week.

Michael Angelo and Raphael are for all beholders: Dante and Ariosto only for the readers of Italian.—S. T. Coleridge.

Our Plates. The site of the new University College buildings in Western Bank, Sheffield, is about three-quarters of a mile from the centre of the city, on the ancient and broad highway leading to the West End. The land is on the ridge of the hill, 420ft. above sea-level, and it adjoins the Weston Park on two sides; the area is 11,821yds., or nearly 2½ acres. The western boundary between the site and the park is to be of light iron railings, so that the building will appear as if within the park, and will be an improvement to it. The building is to be in what may be called Tudor style. The walls are to be of brick with stone dressings. The general plan is of buildings surrounding a quadrangle 154ft. by 110ft., with an annexe for the library. The buildings on the three sides of the quadrangle are to be erected immediately; the fourth side is to be erected at some future date when required, and the library as and when funds are available, and of such a design as shall then be determined. The building on the south side of the quadrangle and facing Western Bank is for general and administrative purposes, and comprises the entrance hall, common rooms, refectory, offices, council-room and the great hall. The hall, which is 100ft. by 40ft., is to have windows upon all sides, with dressed stone walls, oak dado, and oak open-timbered roof. The hall is also the principal feature of the Western Bank front. The building on the west side of the quadrangle, and with a front to the park, is for the arts and science departments, comprising arts, physics, biology and chemistry. The building on the north side of the quadrangle, and also with a front to the park, is for the medical department, comprising anatomy, physiology, pathology, bacteriology, public health, and also medical library and lecture-rooms. The internal finish of the building is dependent upon the amount of subscriptions, but it is intended that, in addition to finishing the entrance, the great hall and the council-room in dressed stone and oak, the corridors and laboratories shall have salt-glazed brick dados and the corridor have buff-coloured facing bricks above the dados. The estimated cost of the buildings, exclusive of the library, is £67,500, and the library, if erected as designed, will cost £7,500. Messrs. Gibbs & Flockton are the architects. The perspective we illustrate is exhibited in this year's Academy. We are indebted to the "Sheffield Independent" for the loan of the blocks.—The site of the L.C.C. Fire-Brigade Station has a frontage to Euston Road of about 58ft. and to Euston Square of about 57ft. The station is built with Portland stone facings to the height of the ground floor, and above that in red brickwork, with projecting oriel windows in stone, and stone dressings to those windows immediately beneath the oriels. The accommodation provided on the ground floor is:—Engine room, 39ft. by 33ft., lined with glazed bricks and paved with grooved stable bricks, gives standing room for horsed escape, steamer and hose cart, ready for immediate use. The run-out will be across the courtyard in front of the station of the same depth as the adjoining gardens, through a gateway at the junction of Euston Road and Euston Square (Seymour Street); the run-in is on the Euston Square front through an archway into a small yard, from which the back engine-room doors open. There are stables for six horses in the rear of the engine-room, top-lighted. Provision is made for a fodder room with loft over adjoining the stalls. The watch-room is on the Euston Road front adjoining the engine-room doorway, and has a floor area of about 150ft. The recreation-room has a large bay window looking on to Euston Square, and has a total floor area of about 400ft. Adjoining is lavatory accommodation with spray bath. The third officer's private entrance is at the angle of the building, and is approached from Euston Square. It communicates directly with a lift and staircase to the third, fourth and fifth floors, where are situated the third officer's quarters. One suite of quarters for a married coachman is also on the ground floor, and adjoins the run-in. The basement extends under all the ground floor with the exception of the engine, room and stables and consists of:—Laundry fitted with six troughs, three coppers, heating chamber and six drying horses; battery room under stairs; workshop; separate storage accommodation for coal, coke, wood and oil; twelve coal stores for station officer and men; three cellars for third officer's quarters. The architect is Mr. W. E. Riley, superintending architect to the London County Council, and the work has been carried out by Messrs. Stimpson & Co., of 78, Brompton Road, the contract sum being £14,377.

Birmingham's Art Master. THE Museum and School of Art Committee of the Birmingham Corporation last week held a special meeting in order to appoint a successor to Mr. Edward R. Taylor, who will retire on June 30th from the Head Mastership of the Municipal School of Art under the terms of the Corporation Superannuation Scheme. Alderman the Right Hon William Kenrick presided. The Committee unanimously appointed Mr. R. Catterson-Smith, who has since 1901 been Head Master of the Vittoria Street School for Jewellers and Silversmiths. Mr. Catterson-Smith was born in Dublin. His father was President of the Royal Hibernian Academy. Originally a successful student and assistant teacher at the Dublin School of Art, Mr. Catterson-Smith, at the age of twenty, entered the studio of Henry Foley, R.A., and remained with him until his death. Then he became well-known as an exhibitor, especially of landscape, but also of portraiture, at the Royal Academy, and as a draughtsman in black and white. His work illustrated his fondness for Nature. In 1893 he entered the service of William Morris, who perhaps did more than anyone else towards the recent revival in England of the industrial arts. It was to assist Morris and Sir Edward Burne-Jones in the production of drawings for the Kelmscott Press that Mr. Catterson-Smith first joined them; he executed most of the "Chaucer" drawings, and designed and executed three of the borders for the "Early Paradise." Of Mr. Catterson-Smith's work in this direction Morris spoke in terms of unstinted praise. His set of "Chaucer" drawings was, in 1901, sold in London for £800. In 1892 Mr. Catterson-Smith began to work in metal. He is a member of the Art Workers' Guild and of the Arts and Crafts Exhibition Society. Visitors to the Arts and Crafts Exhibitions held at the New Gallery will recall especially his beautiful silver repoussé executed from the designs of Burne-Jones. He has also done much metal-work from his own designs. In addition, Mr. Catterson-Smith was for some time associated as a teacher with Mr. George J. Frampton, R.A., and Mr. W. R. Lethaby, then co-directors of the London County Council Central School of Arts and Crafts, and worked with Dr. William Garnett, the secretary of the Technical Education Board of the London County Council. Whilst in London Mr. Catterson-Smith also served under the London County Council as an Inspector of Art Schools and Art Classes held at Secondary Schools—about forty in all. Recently he has acted as examiner of the works submitted to the London County Council for their annual competition for art scholarships.



PLAN OF SITE AND GROUND-FLOOR PLAN.

Leeds City Square. A deputation from the Leeds and Yorkshire Architectural Society, consisting of Mr. Butler Wilson (president), Mr. Richard Wood (vice-president) and Mr. H. S. Chorley (hon. secretary) recently waited on the Improvements Committee of the Leeds Corporation for the purpose of submitting a proposal which in the opinion of the Society would materially improve City Square. The unsightly property at the corner of Quebec Street and Wellington Street—opposite the Midland Railway Station—having just been pulled down, the City authorities are about to fix the new improvement line, and in the ordinary course of things the site will be offered for sale. Before this is done, however, the architects of Leeds represented by the Association think that it would be in the interest of the city if the Corporation would adopt their suggestion that as far as possible the corner of the square at Quebec Street and Wellington Street should be a repeat of the corner of Park Row and Infirmary Street, that there should be erected on the new site a building similar to the Standard premises on the other, alike in regard to contour, sky-line and material. The space at the disposal of the Corporation, it is urged, makes the suggestion quite practicable. Its promoters claim that the symmetrical and harmonious effect on the Square will be such as could be obtained by no other means, and that it would emphasize the central position of the Post Office and the statue of the Black Prince. The city engineer (Mr. T. Hewson) wished to know i the views of the deputation would be met i the improvement line were thrown back a little further than proposed by the deputation, and Mr. Wilson said they would. The Committee instructed the city engineer to stake out the different improvement lines in question, when they will make their decision

KEW BRIDGE.

THE first bridge at Kew was erected in 1759. It was principally the work of one John Barnard, a carpenter, who is styled "architect" in the elevation and sections in the Kew Gardens museum. The bridge had eleven arches, seven of which were of wood, the span of the centre arch being 50ft. and the roadway 30ft. wide. The second bridge, recently pulled down to make way for the new structure opened by his Majesty the King on May 20th, was begun in 1783 and finished four years later. The span of the centre arch was 66ft., the next on each side 55ft., the next on each side of these 45ft. 10in., and the shore arches 38ft. 4in., a total waterway of 344ft. 4in. The new bridge is of Scotch granite. There are only three arches proper—the central arch, with a span of 133ft. and a rise of 24ft. 6in., and side arches of 116ft. 6in. span and 21ft. 6in. rise. At each end are small land arches of 18ft. span and 15ft. headway. The arches, it is said, are flatter than those of any elliptical stone bridge of any importance, and the ratio of rise to span is only 1 to 5·42—a curious contrast to the bridge just removed. The joints are rusticated, and over the piers are four granite shields with the arms of Middlesex and Surrey. The total cost, including compensation and purchase of land, was nearly a quarter of a million sterling. The bridge was built with timber cofferdams, the foundations going down about 30ft. below the cupwaters. Sir John Wolfe Barry, K.C.B., and Mr. C. A Brereton, M.I.C.E., were the engineers. On the contract drawings the width is shown as 45ft., but this was afterwards increased to 55ft.; London Bridge will be 65ft. when widened, Blackfriars Bridge is 75ft. wide and Westminster Bridge 85ft. wide. Altogether the new Kew Bridge has taken about four years to build, including pulling down the old bridge and putting up a temporary one. The trowel and mallet used by the King in setting the coping stone of the new bridge were presented to his Majesty by the engineers: they were made by Messrs. Mappin Brothers from the designs of Mr. Brereton, the mallet and the handle of the trowel being fashioned from one of the oak piles of the first bridge at Kew—the wood was remarkably sound after having been in the water for nearly 150 years. After setting the stone, its accuracy was tested by a spirit-level made in the form of an exact model in silver of the new bridge to a scale of 50ft. to one inch, and having a small crimson spirit-level fixed in the roadway over the centre arch.

TECHNICAL BOOKS.

READERS will doubtless be interested in the lists of books on architecture, building and kindred subjects which we are now publishing. There are to be three of these lists, the first of which was given in our last issue, while the second will be found on p. xi of this issue. The lists have been compiled in response to numerous requests for the names of suitable books on the several subjects, and for the special benefit of our readers we have made arrangements to supply them at their published prices, *post free*. The utility of these lists, showing at a glance all the best books that have been published, is apparent; and we are glad to say that readers are already availing themselves of the opportunities offered, thus proving their appreciation of the trouble we have taken on their behalf. As will be seen, the books are grouped together under different headings, so that the works on any particular subject can be referred to with the greatest ease.

Correspondence.

African Oak.

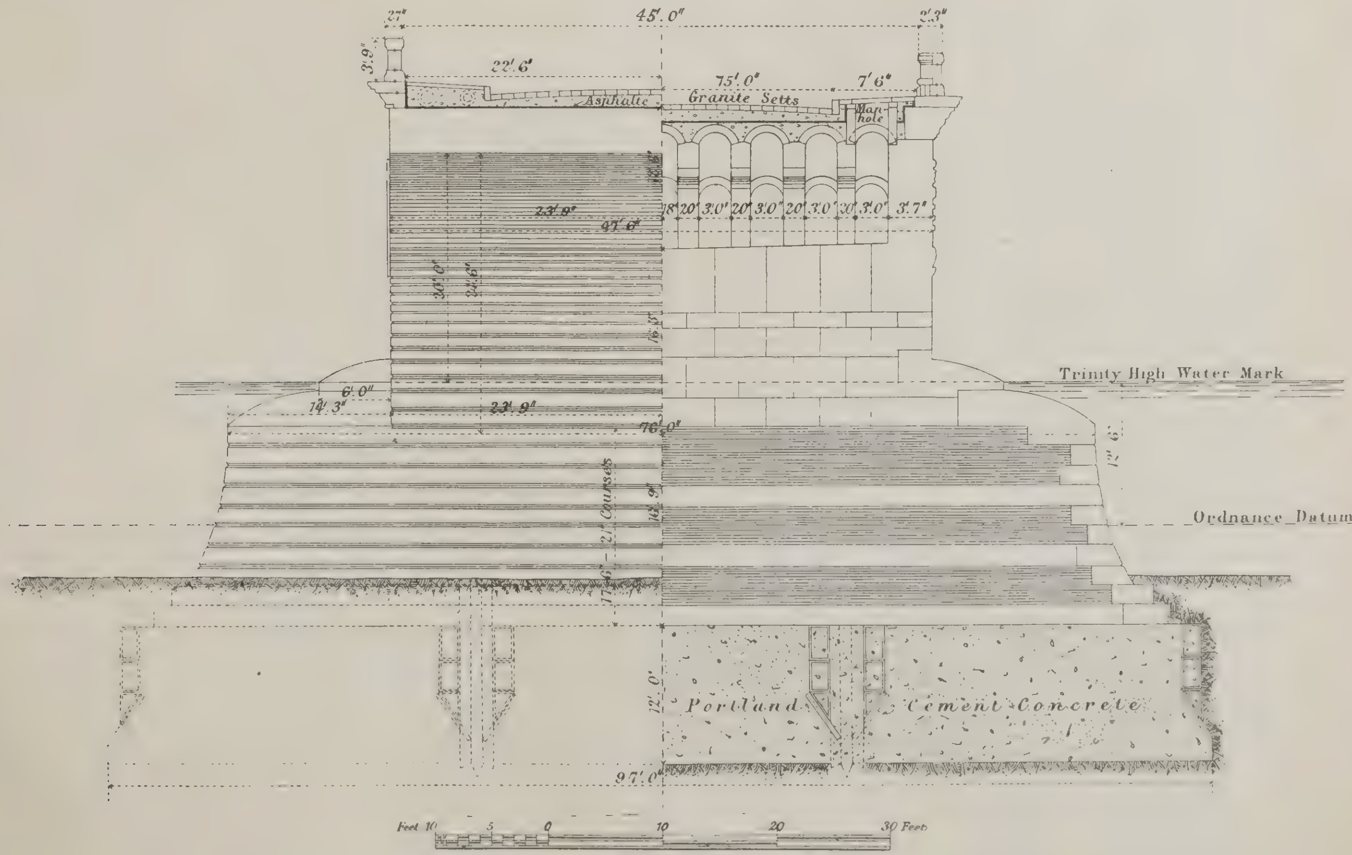
To the Editor of THE BUILDERS' JOURNAL.

EXETER.

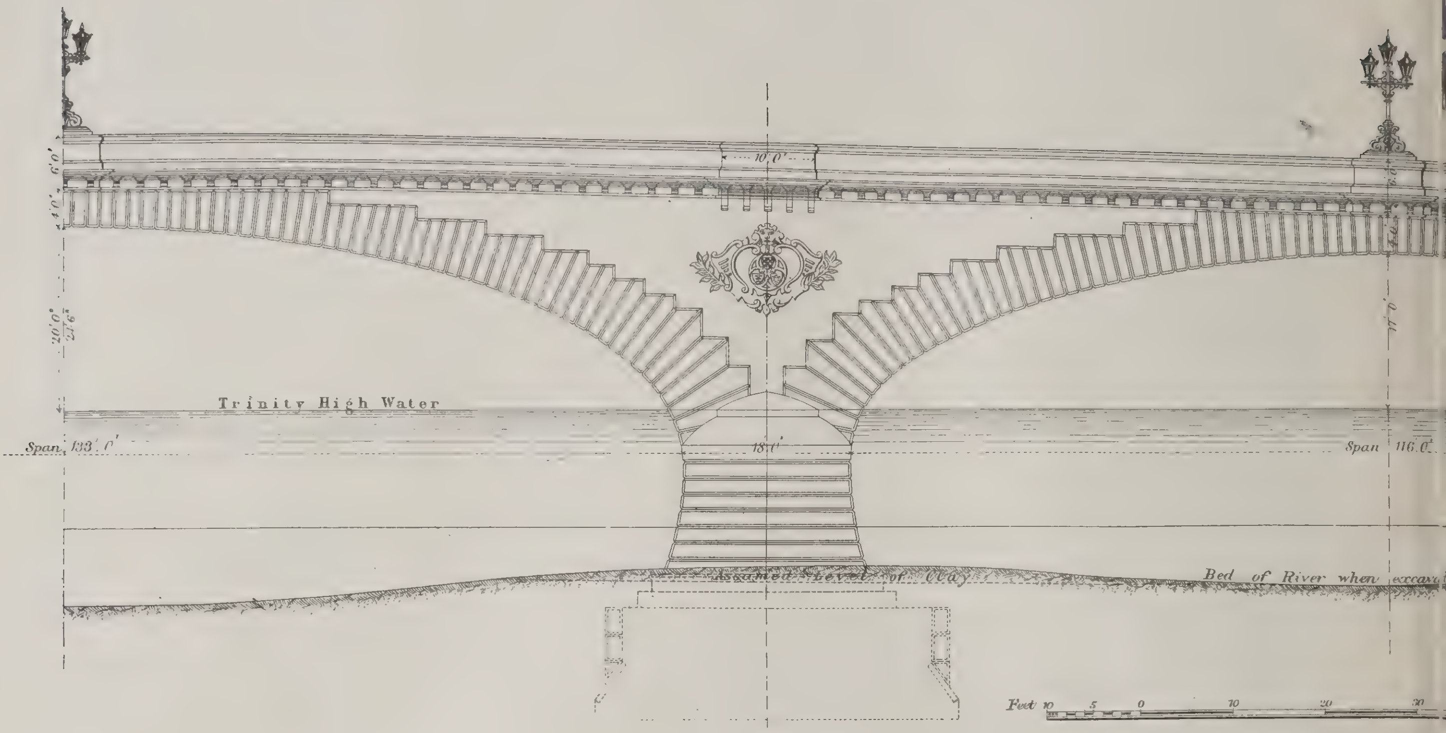
SIR,—No doubt your numerous readers will wonder what a correspondent means by recommending African oak as the best kind for exterior work. And this with reason, as very few people know what African oak may be. Certainly, no such oak has a market in this country nor is used in England. I happen to have in my grounds a fine specimen of that particular kind, but it is a distinct rarity. This species of oak is an evergreen, known in the botanical world as "Q. Libani *Oliv.*," but it is a tree that is not sufficiently large in the butt to be of any practical value to the timber trade. Neither does it grow to any great extent upon the Dark Continent.

Undoubtedly, there is no oak for exterior work to come up to our British oak (*Ròbur*). At the same time—especially when used in great thicknesses—it is bound to "open," however well it may have been seasoned.—Yours truly, HARRY HEMS.

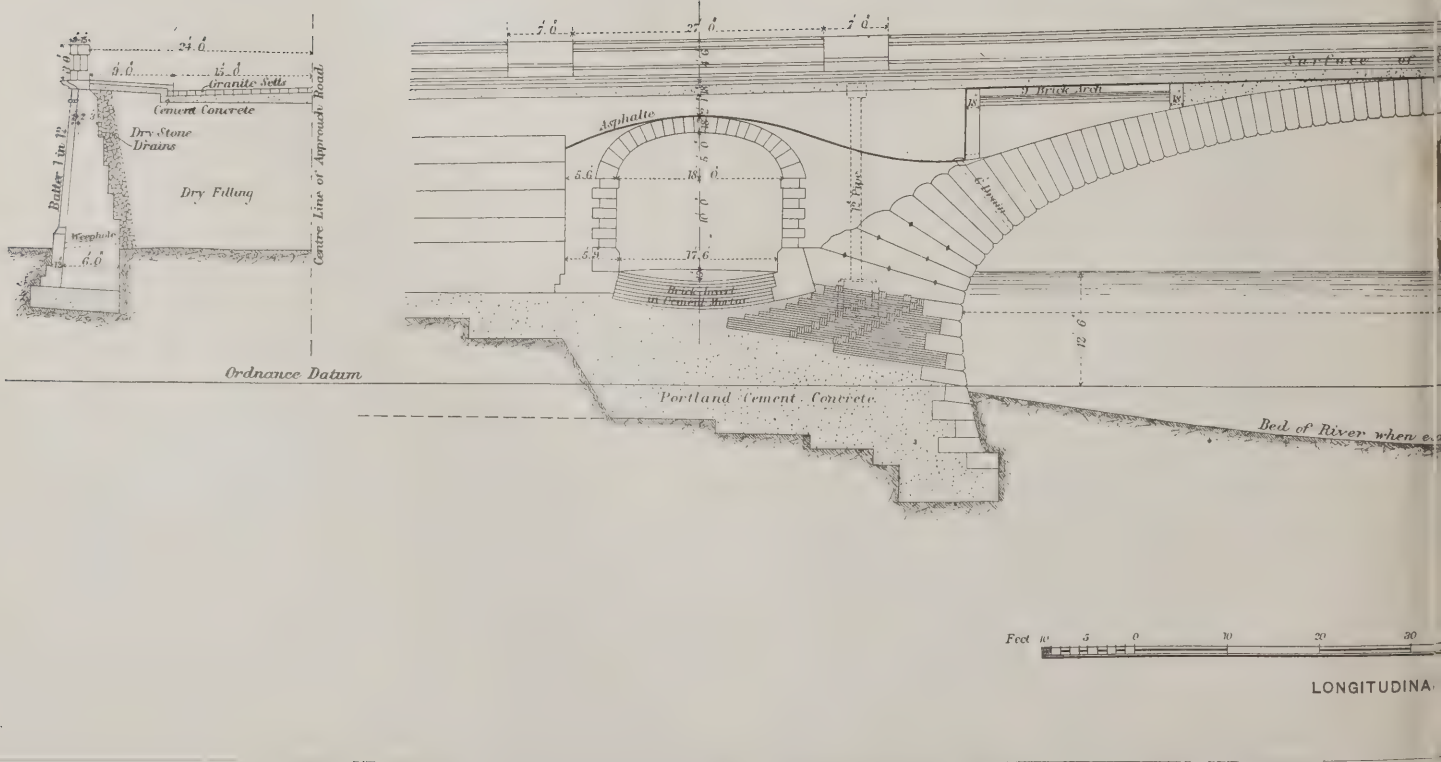
The wood we referred to was that known commercially as African oak or teak (the former being the most common name), the botanical name of which is Oldfieldia Africana. This wood comes from Sierra Leone, and there is only a small supply in the market. It is to be had in quite large enough sizes for gate posts or fencing, for which we recommended it, seeing that the trees grow to a height of over 30ft. or 40ft. with a girth of 7ft. or 8ft. It is a dark red wood, very hard, strong, rigid, non-corrosive of metals, fine, close and straight in grain, free from shakes, shrinks and warps very little, and is very durable. It is difficult to work, however.



THE NEW BRIDGE ACROSS THE THAMES AT KEW: TRANSVERSE SECTION.
SIR JOHN WOLFE BARRY, K.C.B., AND C. A. BRERETON, M.I.C.E., ENGINEERS.

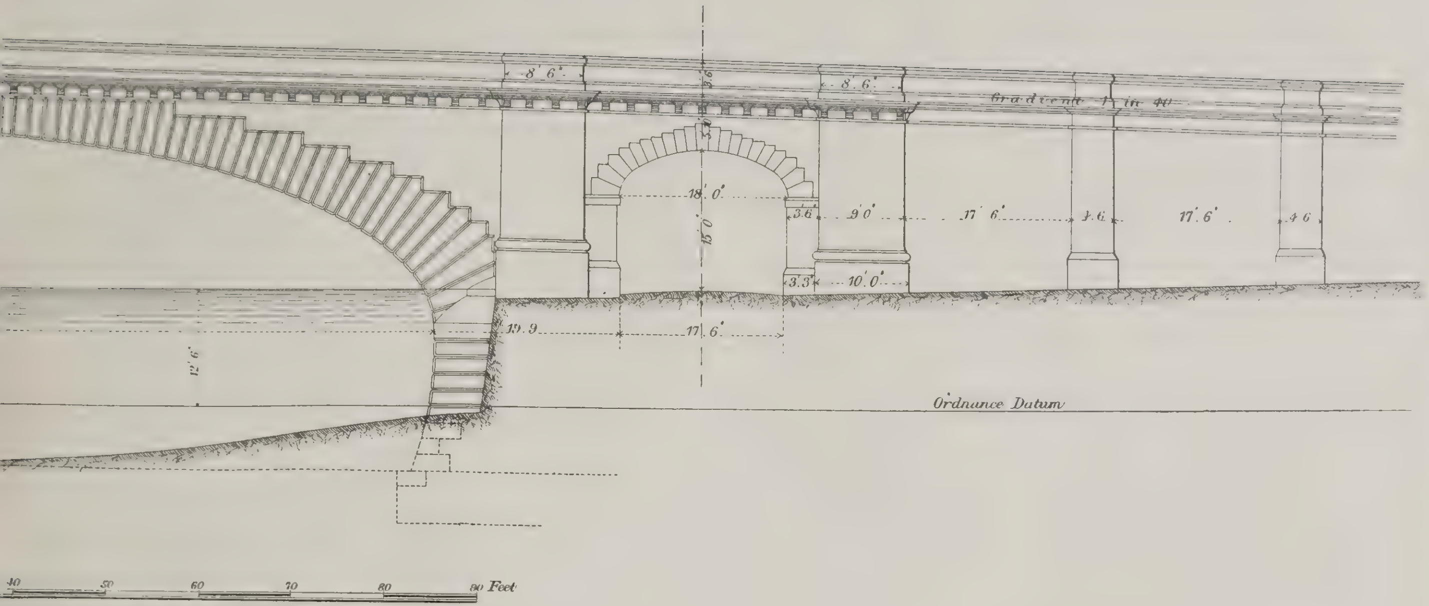


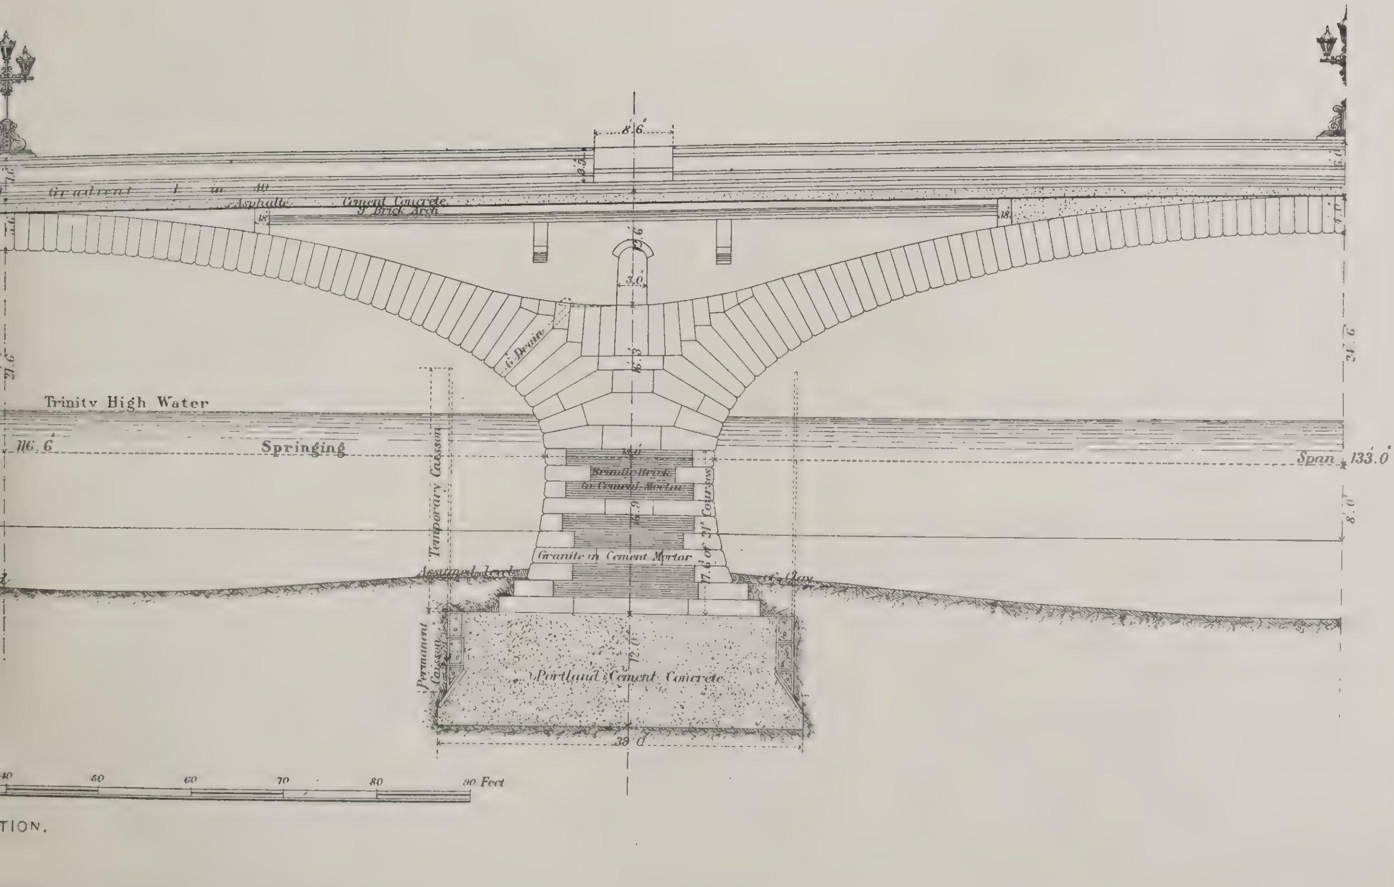
ELEVA



LONGITUDINA

THE NEW BRIDGE ACROSS THE THAMES AT KEW. SIR JOHN W





TION.

BARRY K.C.B. AND C. A. BRERETON, M.I.C.E., ARCHITECTS.

Keystones.

A Stained-glass Window has been placed in the east end of All Saints' Church, Chertsey.

A new Hotel on the East Coast, named the Alexandra, has been opened at Dovercourt. The owner, Mr. T. I. Moran, was the builder, and Mr. G. Sherrin was the architect.

Malmesbury and District County Technical and Secondary Schools were opened recently. Mr. Robert E. Brinkworth, F.S.I., of 16, Old Bond Street, Bath, and of Chippenham, was the architect, and Messrs. Smith & Light were the contractors. The cost, inclusive of fittings but exclusive of the cost of site, was between £4,100 and £4,200.

New Municipal Buildings at Woolwich are being erected. The site has cost £15,000, and has an area of 9,000 sq yds. The buildings have been designed by Mr. A. Brumwell Thomas, of Westminster. The contract price was £50,000, the builders being Messrs. J. E. Johnson & Son, of Leicester. The buildings will consist of a basement and three floors, with a dome and a clock tower rising to a height of 140ft.

The King's Sanatorium is to be erected on a site at Lord's Common, Eastbourne, six miles south of Haslemere, and about three from Midhurst, 150 acres in extent. Mr. H. Percy Adams, F.R.I.B.A., the architect appointed by the Advisory Committee, who has recently by their direction made a very careful study of sanatoria both in Germany and Switzerland, is now preparing his plans.

Architect as Blackmailer.—According to the "Winnipeg Free Press," a well-known architect of Winnipeg, Mr. S. A. Barber, who designed the City Hall, the Leland Hotel, MacIntyre Block, St. John's College, and other buildings in that city, has been remanded on a charge of attempting to blackmail Mr. D. C. Camille Brousseau, a wealthy wholesale grocer at Montreal, and endeavouring to extort a sum of 13,000 dollars.

Clapham Parish Church, on Clapham Common, S.W., has had a new chancel and a chapel added to it from designs by Prof. Beresford Pite, F.R.I.B.A. This church is of the Queen Anne style of architecture, and the new parts have been built to correspond with the rest of the sacred edifice. The old east window of stained glass has been placed in the south wall of the chapel, and two square pillars of Verona marble with white marble bases and alabaster capitals are on either side of the chancel. The electric light has been installed, and altogether the work has cost upwards of £7,000.

The Liverpool Cathedral Petition Committee states that the cathedral movement seems to have for the moment become a somewhat parochial effort to provide a large church for the more special benefit of one district of Liverpool, and that not a particulary central or populous one. As regards Mr. Scott's design, the Committee say that if the religious needs of the present century can be perfectly met by a mediæval form of building, and the æsthetic demands of the twentieth century can be satisfied by lifeless copies of thirteenth-century craftsmanship, then there seems likelihood that the combined efforts of two such faithful disciples of the Gothic Revivalists of the past century as Mr. Scott and Mr. Bodley will be capable of producing that result. They further express themselves satisfied that in due time it will be fully realized by all that there are nobler and more complete ideals possible than these, and they are encouraged by the work and the designs of men like Prof. Beresford Pite, Mr. Leonard Stokes and others to believe that there are living architects capable of fulfilling them.

The Piccadilly Colonnade, with the widening of the thoroughfare between Arlington Street and the Green Park to 85ft., was sanctioned at last week's meeting of the London County Council. The Westminster City Council will contribute £4,000 towards the improvement.

St. Anthony's Elementary Catholic Schools, Newsham Street, Liverpool, are about to be largely extended from designs by Mr. C. Walker, architect, 26, Eldon Square, Newcastle-on-Tyne. Accommodation will be provided for about 2,000 children.

Mr. Samuel Rawlinson, builder, &c., of Swinton, by the will of the late Lady Rawlinson, of West Kensington, London, has just come into a fortune of about £10,000. The late Sir Robert Rawlinson, who predeceased his wife, formerly resided in the Manchester district, and for many years was foreman mason in the Bridgewater Trustees' yard at Worsley.

Discoveries at Caerwent.—The exploration at Caerwent, which has been continued during the winter, has resulted in further important discoveries. A small building with an apsidal end, which it is thought may have been a Christian church, has been unearthed at the north gate. Near the gate, in an adjacent field, have been disclosed the remains of an amphitheatre about 150ft. in diameter. The consent of the parish council was obtained to excavate on the village green, and here, it appears, was the centre of the Roman town.

The Manchester Society of Architects on Saturday, May 23rd, under the leadership of Mr. G. W. Lord, made a sketching visit to Mobberley Church, Cheshire. The rector, Rev. H. L. Mallory, explained various points of interest. By the kindness of Mr. Ernest Leycester, Mobberley Old Hall was also visited, and several sketches made of it. The party numbered about fifteen. On Tuesday evening, May 26th, about sixty members visited the new Midland Hotel, Manchester, by kind permission of the architect, Mr. Trubshaw. The visitors were shown around by Mr. Elwell and Mr. Lund, who explained the general design of the building and the elaborate warming and ventilating arrangements.

Bridges on Tram Lines.—Mr. G. A. T. Middleton, A.R.I B.A., writes in reference to the new L.C.C. electric trams in South London: "I have seen two gentlemen narrowly escape death, one at Balham and the other at Clapham Road railway bridge. The new cars have been so constructed that a moderately tall man getting on just before either of these bridges, or rising to get down directly after, would almost certainly hit his head against the girders. May I suggest a simple remedy—that the present cars be replaced by others a few inches lower, and be themselves transferred to other lines now being constructed by the London County Council on which no such low bridges occur, so soon as these lines are opened."

Society of Architects.—At the meeting of this Society held on May 21st the following were elected as Members:—Messrs. F. G. Fraser (Liverpool), S. H. Healing (Gloucester), A. G. Howard (Cape Town), E. P. Laycock (London, N.), John Love (Fleet), C. R. Mitchell (London, W.C.), A. W. Nye (Brighton), Frederick Quy (Cape Town), P. B. Tubbs (London, E.C.) and W. F. Wills (Derby). As a Student: Mr. R. J. Smith (Weston-super-Mare). After the transaction of the formal business, the president, Mr. Silvanus Trevail, gave an account of his impressions of architectural rambles on the Continent, illustrating his remarks by a large number of lantern slides. On May 21st the Society held a field day at Rochester, the party numbering about seventy. They visited Eastgate House, the Cathedral, Restoration House, the Castle and Cobham.

The new Church of St. Thomas, East Kirkby, Notts, was consecrated recently. The cost will be nearly £6,000.

Bolton Hall.—A start has been made with the rebuilding of Lord Bolton's Wensleydale seat, which was burnt down on October 15th last year. The contract for the work has been let to Messrs. Joseph Howe & Sons, of West Hartlepool. The old Georgian style of architecture is to be rigidly adhered to in the new building.

The Edinburgh Architectural Association recently visited Stirling Church and Castle. Mr. Morris, town clerk, and the Rev. Mr. Smith received the members at the church, and Bailie James Ronald, Stirling, acted as leader, and conducted the party over the east and west portions, and gave descriptions of the building, the date of erection, division into two churches, and the various alterations and restorations. The members were afterwards enabled to thoroughly inspect the Castle. Mr. J. T. Baillie, architect, Edinburgh, acted as leader, and read an account of the buildings. At the close cordial votes of thanks were accorded to the provost and magistrates, the ministers, Bailie Ronald, Colonel Hunt and Mr. Baillie.

The Church Crafts League held its half-yearly general meeting on May 25th last in the hall of Clifford's Inn. The Dean of Westminster presided. A lecture on "Altars—their Arrangement and Ornaments" was delivered by Mr. F. C. Eccles, who traced the gradual development of the Christian altar of primitive times into the altar of the mediæval type found in the illuminated manuscripts which have come down to us. By means of a series of lantern slides he showed that the modern artist would find plenty of scope for his inventive genius, even if restricted to the traditional treatment of the holy table imposed upon us by the "Ornaments Rubric." He strongly deprecated the prevailing tendency of making the altar insignificant by drawing the eye of the observer from the table itself to an erection of candlesticks and pots of flowers behind it.

Obituary.

Mr. Joseph Bathurst, builder, of Rochester, died recently at the age of seventy-six years.

Mr. John Wheeler, a retired builder, who has passed away at Wantage at the age of eighty, enjoyed the distinction of having restored no fewer than sixty churches in Berks and the adjoining counties during his business career. A good deal of his work was done for the Ecclesiastical Commissioners.

Mr. Jacob Parkinson, of South Beach, Blackpool, joiner and contractor, died recently at the age of sixty-six years. He went to Blackpool about thirty years ago from Lytham. He was with Mr. R. Braithwaite, joiner, Temple Street, for some time, and afterwards commenced business on his own account.

Mr. William Davidson, quarryowner and builder, of New Pitsligo, died recently at the age of sixty years. Amongst the large contracts deceased was engaged in building were the West Parish Church, Fraserburgh; Pitsligo Parish Church; Free Church, New Deer; Town and County Bank buildings at New Deer and Strichen; Troup House, Pennan, &c.

Mr. David Buchan, a prominent Perthshire builder and contractor, died at his residence, Tomaknock, Crieff, last week at the age of fifty-eight years. He succeeded his father as a builder in Crieff. In the course of his business career he built a large number of important blocks of buildings, the largest, as well as the most recent, of which are the Police Buildings in King Street, Crieff. He was also lessee of the Laggon quarry on the Ochtertyre estate.

Builders' Notes.

The new Trallwn Schools at Pontypridd are being fitted with Messrs. F. A. Baker & Co's. patent exhaust ventilators and inlets.

The New Infectious Diseases Hospital, Scarborough, has been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their exhaust roof ventilators and special inlet and outlet ventilators.

Caen Wood Towers, the historic mansion at Highgate now the property of Mr. C. F. Cory Wright, J.P., has been entirely re-decorated, the floors covered with Mainzer's improved parquet and the conservatory paved with Arrolithic mosaic of special design. The alterations have been carried out under the supervision of Mr. G. E. Nield, A.R.I.B.A., of the Outer Temple, 222, Strand, W.C.

Southwark Bridge proposed to be lowered.—The Bridge House Estates Committee has prepared a scheme for the reconstruction of Southwark Bridge, which is at present almost unused owing to the severity of the gradient on the approaches from the City side. Under the new scheme, the crown of the present structure will be lowered 7ft. with the result that the gradient will be reduced to 1in. in 50in. The estimated cost of the scheme is over half a million, which will be paid out of the Bridge House Estates Funds.

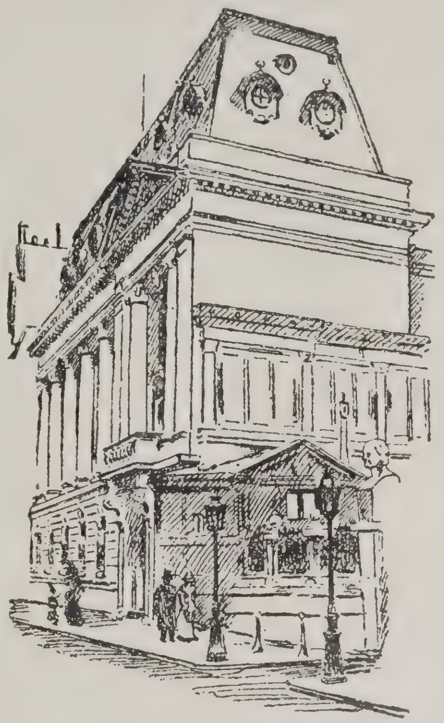
Fireproof Floors.—The Columbian Fireproofing Co., Ltd., 37, King William Street, E.C., have secured the contract for the whole of the steel construction and erection and fireproof floors for the new premises for Messrs. Laurie & McConnel, Ltd., general providers, of Fitzroy Street, Cambridge, whose premises were destroyed by fire some time ago. This will be the first absolutely steel frame building of the warehouse class erected in England. The architect is Mr. R Frank Atkinson, 8, Sackville Street, Piccadilly, who has designed the new buildings in Oxford Street for Messrs. Waring, Ltd.

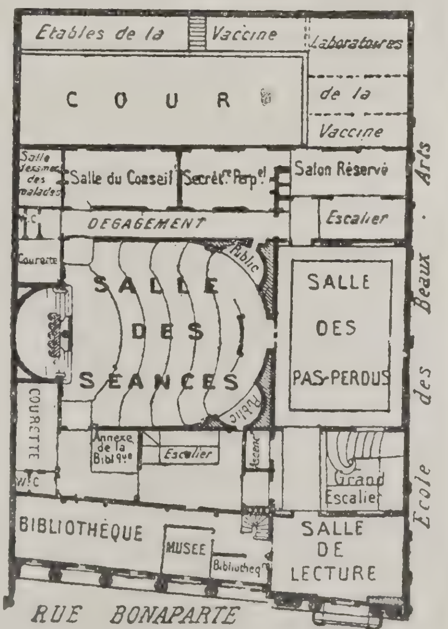
Garden Requisites. — Messrs. Barnard, Bishop & Barnards, Ltd., of Norfolk Iron Works, Norwich, have just issued a small catalogue of garden requisites. It is fully illustrated, and contains prices and particulars of the following among many others :—Garden seats, tables, water barrows, tanks, hose reels, garden rollers, lawn mowers, espalier fittings, wire lattice, garden frames, flour and corn bins. It is these things out of the general run which an architect usually finds difficulty in obtaining prices for or particulars of ; thus this catalogue gives the stock sizes which are often desired in planning so as to allow room for them in corners, &c.

Work in South Africa.—Advertisements have recently been published inviting applications from house carpenters and joiners to proceed to Port Elizabeth, South Africa, as, owing to the scarcity of good workmen, the Master-Builders' Association of that town have instructed the agents in this country to engage suitable hands. The South African steamers making Capetown their first port of call, workmen are very frequently tempted by the higher rate of wages offered up country to engage themselves, when, as a fact, the rate of living in Port Elizabeth, the second port of call, is so much cheaper than in Johannesburg that the standard rate of wages there, 1s. 10d. per hour, goes much further than even the higher rates paid in such a place as Johannesburg. Besides this, workmen inland are often stopped for want of material getting up from the coast, which is not the case at Port Elizabeth, where the material is landed. At Port Elizabeth a very large number of buildings are being erected, and everything tends to strengthen the opinion that work will become more plentiful as the country settles down and assumes its normal condition.

ACADEMY OF MEDICINE, PARIS.

THE new building for the Academy of Medicine at Paris which replaces the confined and inconvenient temporary quarters in the Rue des Saint-Pères in which that institution has been lodged for the last fifty-three years was formally opened by the President of the French Republic a month or so ago. The new Academy of Medicine is situate in the Rue Bonaparte, adjoining the courtyard of the Ecole des Beaux-Arts, on the site of a former branch office of the Mont-de-Piété, or municipal pawnbroking establishment. It was commenced in the month of May, 1899, M. Rochet of the Paris Poor Law Board (l'Assistance Publique), being the architect. The vestibule to the council-chamber is adorned with the celebrated picture by Muller representing Pinel removing the fetters from the patients at the Bicêtre, and two other pictures, one being a copy of Rembrandt's Lesson in Anatomy and the other Harvey demonstrating the circulation of blood before Charles I. The vestibule is also decorated with busts of academicians and portraits of professors. The council-chamber contains 110 seats, each seat being furnished with a desk of oak coverd with red leather. There is a balcony round the hall for the public, a portion of which is reserved for the Press, approached by a separate staircase. In the retiring-room attached to the council-chamber is a portrait of Andreas Vesalius (1514–64), the founder of the study of anatomy, attributed to Titian. The library and reading-room, which are of considerable extent, occupy the whole of the frontage on the Rue Bonaparte. The total cost of the building, including the value of the site, was £65,080, the cost of site having been £20,540, making the nett cost of the building £44,540.





L.C.C.

Works Department and Contractors.

AT last week's meeting of the London County Council the Works Committee presented a long report in reference to the superstructure of the new asylum at Horton Manor, Epsom. The work was executed by the Works Department, and it has cost about £39,000 more than the amount of the architect's final estimate. The Committee attributed this excess to the following causes :—(1) Error of judgment on the part of the late manager of works in undertaking the work and insufficiency of accepted estimate ; (2) refusal of local authority to allow temporary railway for carriage of material ; (3) rise in prices of materials and in wages ; and (4) scarcity of labour. The estimate for the work was £291,110, and the actual cost £330,500.

Sir John McDougall said the lowest tender was £12,000 above the architect's estimate, and as the Department had saved £7,000 under certain heads, here was roughly £20,000 to set off against the £39,000 excess. Besides, a contractor would have claimed extras, but the Department got none. It was also calculated that the Department had lost £11,000 owing to being refused permission by the local authority to construct a temporary railway for cartage.

Mr. White said he knew as a fact that the contractors who tendered for this work had agreed among themselves to put an extra 5 per cent. on their charges because of the onerous conditions of the Council.

Mr. Burns said the so-called onerous conditions were simply good work and the wages prevailing in the trade with equality of treatment for unionist and non-unionist. He reminded Mr. White that the Asylums Board some time ago gave out the work of building Brook Hospital to a contractor at £194,000. It cost in the end £264,000, and although Mr. White was a member of the Asylums Board he said nothing about this excess at the time. Since the Works Department was established the Council had remitted to it work estimated at £1,486,000, the actual cost of which had reached £1,548,000, or £62,000 above the estimate. This only represented an excess of 4 per cent. on this great mass of work, and he maintained that the Council had got 14 per cent. better quality in the work. If they counted in the profits made by the Department on jobbing works, and allowed for the sums paid off in interest and capital, the excess would be found to be no more than £16,000, or 1 per cent. The Department was overloaded with establishment charges such as no private concern would stand. These had been made necessary by the irritating restrictions imposed by the Moderates. Over £178,000 had been spent on establishment charges alone. These were monstrous charges, such as no contractor could bear. For his part he was prouder of nothing more than of the work he had done in association with the Progressive Party in setting up the Works Department and freeing London from the toils of contractors.—The Council approved the report.

MODERN LONDON BUILDINGS.

(Continued from p. 195, No. 431.)

A list of public and semi-public buildings in the E.C. district was published in our issue for March 25th, of domestic and religious buildings, colleges and schools in the same district in the issue for April 1st, of business premises in the same district in the issues for April 15th, April 29th and May 13th, and of hotels, restaurants, &c., in the same district in the issue for May 13th.

E. DISTRICT: PUBLIC AND SEMI-PUBLIC BUILDINGS.

BUILDING.	ARCHITECT.	APPROXIMATE COST.	REMARKS.
1875.		£	
Billingsgate Market -	Horace Jones, City Architect.	—	The area of ground covered by the market is 40,000ft. super. The building has a glass and iron roof, and is carried out in the Italian style.
"Boyd" Workmen's Institute, Victoria Docks.	Giles & Gane	4,000	The Institute contains a lecture hall to hold 600 persons. It is built of brick, with Farleigh Down red-bed stone, and red brick dressings
Fire-Brigade Station, Commercial Road.	George Vulliamy	—	The accommodation provided is for three engines, two escapes, one coachman, twelve firemen, with stabling for five horses.
1876.			
Fire-Station, Isle of Dogs -	- - -	3,987	
1877.			
East London Hospital for Children, Shadwell.	H. J. & C. A. Legg	13,000	There is an administrative block, with dispensary attached. The ward blocks are 70ft long. giving 1,000 cub. ft. of air-space per child. There is an isolation building for infectious cases, and in the rear are laundry, post-mortem room, operating rooms, and a small museum The hospital contains accommodation for ninety-two patients.
1879.			
Town Hall, Limehouse -	A. & C. Harston	10,000	The frontage is 80ft., Italian in style. White bricks were used for facings, and Portland stone for dressings. There is a board-room on the first floor, 70ft. by 40ft.
1880.			
Mortuary at Bethnal Green	Gathercole, Vestry Surveyor.	1,357	Luton grey brick and Portland stone were used for the walls, the floors being of patent Victoria stone.
1882.			
Mariners' Institute, Canning Town.	Bryne & Crombie	—	Red brickwork is used for the front and stock bricks for the side and back walls. The cabins are 8ft. by 5ft. by 7ft. 6in. high.
1885.			
Paragon Theatre of Varieties, Mile End Road.	Frank Matcham	—	The auditorium is 100ft. long by 60ft. wide, or with promenades 100ft. wide, by 60ft. high. The stage opening is 34ft. square, the depth being 64ft.
Working Lads' Institute, Whitechapel Road.	George Baines	4,716	The refreshment-room is 24ft by 13ft ; the gymnasium, also on the ground floor, is 33ft by 27ft. by 17ft. high. On the first floor is the reading-room, 30ft. by 30ft, to accommodate 150 boys, leading out of which is a students' room. The second floor contains classrooms, and the third bedrooms and dormitories. The front is in the Renaissance style in red brickwork, with Portland and Ancaster stone dressings.
1886.			
Great Assembly Hall, Mile End Road.	Boulnois & Warner	—	The hall is designed to accommodate 5 000 persons, being 130ft. by 70ft. Three entrances from Mile End Road lead into an octagonal hall of 44ft. sides by 34ft. high. There are also a coffee-palace and book-saloon. In the hall are two tiers of galleries, a large orchestral-sloped platform, and an organ at one end.
London Hospital Medical College (Rebuilding).	Rowland Plumbe	—	The facings are of yellow brickwork, with red brick architectural features, the style being free Renaissance.
1887.			
People's Palace for East London, Mile End Road.	E. R. Robson	100,000 (including site).	The style of the building is somewhat Oriental in character, though Renaissance in detail. Stock bricks are used for the general walling, with red brick edgings Portland stone being used for dressings, columns, arches, &c. The building contains the Queen's Hall, library, technical school, lecture-rooms, workshops, swimming baths, &c. The library was opened two years later. It is octagonal in shape, being 76ft. 6in. across. It cost £10,000.
St. George's-in-the-East Workhouse, New Buildings, Prince's Street, Old Gravel Lane.	Wilson, Son & Aldwinckle.	15,000	The additional buildings provide 198 beds. The block is of five storeys, containing wards 69ft. by 27ft. Stock bricks were used for the halls to harmonize with the existing buildings.
1888.			
Dr. Barnardo's Home, Additional Building, Bower Street, Stepney Causeway.	R. H. Hill	—	The building covers a ground area of 135ft. by 60ft. On the ground floor are swimming bath, library, uniform-room and playroom. The first floor contains classrooms and the director's and secretary's rooms. The second floor contains a gymnasium 110ft. by 56ft, and the third floor store-rooms The general walling is of stock brickwork, Brown's pressed bricks being used for arches and strings. The doorway and mullions are of Drake's artificial red stone. The building measures 81ft. to the ridge and 57ft. to the cornice.
Dr. Barnardo's Infirmary, Stepney Common.	Ebenezer Gregg	8,500	The basement floor contains a dispensary, waiting-room, lavatory, kitchens and linen-rooms. On the ground floor are reception-room, girls' playroom, ward operating room, linen-room, bathroom and lavatory. The first, second and third floors contain the matron's sitting and bedrooms, nurses' room, wards, bathrooms, &c.
Fire-Brigade Station, Woolwich Road, Silvertown, West Ham.	Lewis Angell	—	
1889.			
Bethnal Green Board of Guardians' Workhouse Schools, Leytonstone.	A. & C Harston	—	Twelve houses for boys and girls form a quadrangle 300ft. by 224ft. The end of the quadrangle is bounded by a building containing school classrooms, and in the middle is a building containing the dining-hall.
1890.			
Baths for the parish of St. George's-in-the-East.	Keith D. Young	—	The swimming-bath measures 73ft. by 30ft. There are forty-three private baths and a residence for the superintendent.
Police Station, Leman Street.	J. Dixon Butler, Surveyor to the Metropolitan Police.	—	Ample accommodation has been provided for the public service and for quarters for married constables. The buildings are of red gault bricks, red Mansfield stone having been used for the entrances and dressings. The roof is of steel troughing covered with concrete and asphalt.
1891.			
Additions to the London Hospital, Whitechapel Road.	Rowland Plumbe	16,000	On the right side are the waiting- and receiving-rooms, rooms for the examination of patients and for nurses. On the left side the chief apartment is the students' dayroom. On the first floor is the chapel, and on the second surgical and clinical theatres, both of which are 40ft. by 23ft., top-lighted. The chapel is 80ft. long.
1892.			
Public Baths and Washhouses, Bow.	Harnor & Pinches	28,000	The buildings have a frontage to the Roman Road. There are two swimming baths, one 90ft. by 30ft. and the other 87ft. by 30ft., the larger provided with a gallery to hold 300 persons. There are forty compartments in the washhouses.
Whitechapel Free Public Library and Museum, High Street, Whitechapel.	Potts, Son & Hennings.	6,454 (given by Mr. Passmore Edwards).	The site is 131ft. long and 46ft. wide. The entrance is in the centre of the front, and has on the left the lending library, and on the right ladies' and boys' rooms. In the rear is the large reading-room, 45ft. by 69ft. A staircase gives access to the reference library. The lending library and store are placed in the basement. Beyond the staircase is the commissioner's room and the museum, which is top-lighted and measures 45ft. by 30ft. The front is faced with red Stanstead brick and terra-cotta dressings.
1893.			
Clock Tower. Peoples' Palace, Mile End Road.	E. R. Robson	2,000	This tower is constructed of clean-hewn Portland stone, with granite foundations.
1894.			
Poplar Accident Hospital, East India Dock Road.	Rowland Plumbe	—	The existing buildings were modified. The additional building contains, in the basement an out-patients' department, with surgeon's-room, waiting-room, examining-room and dispensary, while the three floors above form three wards, each arranged for twenty beds. On the floor above them are the kitchen, sculleries and some bedrooms.
Poplar Union Board Room, Administrative Block, Dispensary and Relief Offices, North Street, Poplar.	Walter A. Hill & Son	—	The buildings occupy a corner site, with frontages of 67ft. and 120ft. respectively, built in red brick and Portland stone.

E. DISTRICT: PUBLIC AND SEMI-PUBLIC BUILDINGS—*cont.*

BUILDING.	ARCHITECT.	APPROXIMATE COST	REMARKS.
1894—*cont.*		£	
ublic Hall, Barking Road, Canning Town.	Lewis Angell	17,984	The building includes two main floors and has a façade of 73ft., the height from the ground to the pediment being 73ft The building is classic in character, freely treated, the materials used being red brick and Portland stone On the left side of the ground floor is the minor hall, 49ft. by 24ft. On the right side of the main corridor are situate public offices, and a committee-room, 28ft. by 18ft., is provided at the end of the corridor. The large hall on the first floor is 80ft by 50ft, with a height of 35ft.; the gallery and stage add 38ft to the length. Accommodation is provided for 1,700 persons.
ublic Library, High Street, Poplar.	J. & S. F. Clarkson	—	The frontage of the building is 100ft., and the depth a little over 100ft. All the public rooms are on the ground floor. The public hall, to seat 200 persons, was temporarily omitted, for want of funds. The librarian's house occupies the one- and two-pair storeys of the front central block. The exterior is of stock brickwork and Portland stone, and the interior is finished in adamant plaster.
eamen's Mission Institute East India Dock Road, Poplar.	Sir Arthur Blomfield & Sons	13,500	The main institute, which holds 550 men, is for purposes of social recreation, lectures concerts and temperance meetings. Over this is a room for the officers and apprentices of the Mercantile Navy, with three classrooms. Adjoining the institute is a coffee bar. The building is of red brick and Bath stone.
1895.			
'he "Passmore Edwards Wing" West Ham Hospital.	Lewis Angell	3,800	The extension consists of three storeys—two wards, each containing 12 beds: the third floor containing 10 cubicles and a common room for the nursing department.
1896.			
orough Theatre, High Street, Stratford.	Frank Matcham	20,000	The theatre is built on the cantilever principle without internal columns, and is seated for 3,500 persons. The exterior is Elizabethan in style, and is carried out in dark-red bricks with stone dressings. The stage is 45ft. by 35ft., with a width of oft.
ublic Baths, Goulston Street, Whitechapel (Extension).	Bruce J. Capell	14,000	The second-class swimming bath was extended 28ft, and a swimming bath for women, 66ft. by 27ft. added; 130 dressing boxes have been provided as well as twenty-seven first- and second-class private baths for women. Ninety-one baths are provided, on the first floor, for men, and on the same floor rooms have been added for the superintendent. The exterior of the building is of brick, with Portland-stone dressings.
1897.			
ambridge Theatre of Varieties, Commercial Street.	H. Percivall	25,000	The hall is in the Moorish style, and is built of red brick, with Bath-stone dressings. It accommodates 2,500 persons. Every part of the building is provided with two distinct exits and fireproof staircases The pit and stalls are about 10ft. below street-level; the first circle is level with the street, and with a gallery above.
hapel, Whitechapel Infirmary.	Bruce J. Capell	800	The chapel, which was adapted from a disused ward, is capable of accommodating 150 persons.
assmore Edwards Public Library, Cable Street, Shadwell.	Maurice B. Adams	—	The main feature of this building is the large reading-room, situated in the rear, a spacious apartment 46ft. square and roofed by a steel-constructed dome filled in with fibrous plaster spandrels, and having a lantern over. The reference-room occupies the whole of the frontage on the first floor, with three large oriels. On the ground floor the boys' room, 23ft. 6in. by 19ft 6in., is to the left of the entrance hall, and the borrowers' counter is to the right, on the same side as the librarian's and commissioner's rooms. Filing and staff rooms are in the basement and a caretaker's residence with separate entrance and staircase is provided. The front is in red brick, with lime stucco on the first floor; the entrance porch and cornice and other dressings are of Portland stone.
olice Station, corner of Goodman's Yard and the Minories.	Andrew Murray, City Surveyor	—	The building is of red brickwork, with principal entrance at the corner, which is rounded and surmounted by a turret. On the ground floor are the charge-room, the inspector's room and the muster-room, and opening out of the last is an apartment for the use of detectives. Seven cells are provided cased with glazed brickwork. In the basement are the mess-room and kitchen, with the necessary offices and coat and helmet rooms. The ground floor also contains a reading-room and a large recreation-room. There are three floors of cubicles, sufficient to accommodate sixty-five men.
1898.			
assmore Edwards Free Library, East Ham.	Silvanus Trevail	—	The building is erected of Ruabon red facing bricks, with Bath-stone dressings, and the roofs are covered with Belgian green slates and the clock turret with copper. A residence is provided on the first floor for the librarian.
'est Ham School Board Offices, The Grove, Stratford.	W. Jacques, Architect to the Board	13,964	The frontage of the buildings to the Grove is over 82ft. in length, and the offices, arranged on two floors, extend, in the rear, to a depth of 127ft. On the upper floor the clerk to the Board and his staff occupy the entire front; behind their rooms are committee- and waiting-rooms, and behind these again is the board-room, 40ft. by 35ft, with rooms for chairman and members. On the lower floor, in addition to the entrance hall and vestibules, are the porter's lodge, the architect's office and a room for committee meetings, whilst to the rear are more committee-rooms, &c. Under these is a basement. The building is of red Staffordshire brickwork and Portland stone
'est Ham Technical Institute and Public Library.	Gibson & Russell	60,000	The building comprises a news-room 110ft. by 33ft., a reference library 35ft. square, and a lending library with a public counter 60ft. long, ; also the necessary offices for the staff The news-room is richly decorated, and has two friezes in plaster, modelled and painted by Mr. Fehr. The furnishings in this room are specially designed in oak. The reference library has walnut furniture. The exterior is in red Cranleigh bricks and Portland stone, with symbolical sculpture by Mr. Birnie Rhind. A museum was erected on the eastern side of the institute, costing £7,000, which was largely contributed by Mr. Passmore Edwards
1899.			
oroner's Court, High Street, Poplar.	Lansdell & Harrison	—	The building consists of a coroner's court, shelter block and mortuary block. The coroner's court faces the High Street, and contains a court, coroner's jury retiring-room, witnesses' waiting-room, w.c. and lavatory accommodation, and apartments for the caretaker. The shelter block contains temporary accommodation for two families for use during the disinfection of their homes, where cases of infection have occurred. The mortuary block consists of two mortuaries, the smaller one for infected cases, with accommodation for eight bodies, and the larger for twelve bodies, on the catacomb principle, and a post-mortem room with laboratory. The buildings are grouped round a quadrangle, with entrance for hearses, &c.
npire Theatre of Varieties, The Broadway, Stratford.	W. G. R. Sprague	—	The auditorium has a depth of 70ft. with a clear width of 60ft., and is constructed entirely without columns On the ground floor are fauteuils, stalls, and pit. On the first tier is the grand circle, and on the second tier is the balcony, with the gallery above it, forming practically a three-circle house. The stage is 40ft deep and 70ft. wide, with a height of 55ft A feature of the new building is a number of boxes at the rear of the grand circle. Raised promenades are provided on each level The style of decoration throughout is Moorish.
.and Baths, Glengall Road Poplar, E.	J. & S. F. Clarkson	—	
blic Baths, Balaam Street, Plaistow.	A. Saxon Snell	22,308	The men's first class swimming-bath has a water area of 100ft. by 27ft., and there are sixty-two dressing boxes, and a gallery surrounding it. The second-class bath has a water area of 60ft. by 27ft., and a depth graduating from 3ft. to 6ft.; there are fifty dressing boxes. There are twenty-seven private baths for men and women. The buildings also comprise a caretaker's residence and a towel-laundry. The frontage to Balaam Street is of Leicestershire red bricks, relieved with Portland stone cornices and dressings, the roofs being covered with Westmoreland green slates.
hitechapel Art Gallery, High Street, Whitechapel.	C. Harrison Townsend	—	The gallery provides ample wall-space to hang 450 pictures. The ground-floor hall, which is capable of being let for meetings when not occupied by loan exhibitions, is lighted from aisles which are thrown out on either side, it being impossible to obtain side-light on account of adjoining buildings. The material for the façade towards the High Street is a soft tone terra-cotta. The mosaic which forms the dominant feature of the design was designed by Mr. Walter Crane, and is 25ft. long by 20ft. high. The cost of erection was borne by Mr. Passmore Edwards.
1900.			
thnal Green Infirmary, Cambridge Road, E.	Giles, Gough & Trollope	—	The building will accommodate 750 patients, together with the staff connected with the institution. The site has a length of 740ft., with a frontage to Cambridge Road of 330ft., and of 280ft. to Russia Lane, with an area of about 4½ acres. The Cambridge Road frontage is partly occupied by an entrance block. The administrative block is central, and contains the medical officers', matron's, nurses' and female servants' quarters, and the main kitchen and stores departments. This block contains four storeys, with basement. Separating the front portion of the block from the back is the main corridor, running east and west to the wards, and enlarged at its centre to form a serving hall. The wards are contained in separate blocks, situated three on each side of the administrative block. The ward blocks are each of three storeys, placed axially north and south. The wards contain from twenty-six to thirty-six beds, the large wards being 24ft wide, and warmed by hot-water radiators on the low-pressure system. The buildings are of stock bricks, with best quality facings, relieved by strings of moulded white Suffolk bricks, and the heads and sills of windows are of white Portland stone. Internally glazed bricks have been largely used, and the floors generally are of pitch-pine.
ssmore Edwards Museum, West Ham.	S. B. Russell	10,000	This building adjoins, and is connected with, the Institute, and in character of design is similar to it. The museum contains on the ground floor two galleries and a curator's room, on the first floor three galleries, and there is a large store in the basement. The lighting is mainly from the roof. The floors are of marble mosaic.
est Ham Infirmary, eytonstone.	Sturdy	225,000	The site is that of old Forest House, and comprises about 45 acres. The infirmary when completed will consist of four wards, three storeys high, with accommodation for 672 patients. Each block will be connected by a central corridor. An administrative block of buildings, ward-room and chapel, committee-room, dispensary and rooms for lunatics will be built behind, and provision is also made for the accommodation of seventy nurses.
1901.			
ematorium at Ilford Cemetery.	D. J. Ross	10,500	The plan provides for a chapel 52ft. by 25ft., having one entrance porch and a catafalque. The cremation chamber is at the rear of the chapel. The building has a flat roof, with a stone parapet. The furnace flue is arranged in the centre of the tower and is 80ft high. The crypt is arranged to receive urns. The walls are of Kentish ragstone, and the roof to chapel is covered with Broseley tiles.
rth Eastern Hospital, New Buildings, Hackney Road.	A. & C. Harston	113,642	The new buildings, which form the first section of the permanent hospital, consist of an administrative block, laundry, staff quarters, medical superintendent's and steward's houses, porter's lodge, receiving and discharging rooms, mortuary, four diphtheria and enteric blocks, two isolation blocks and a tank tower.
ssmore Edwards Public Library, corner of Commercial Road and Norway Place, Limehouse.	J. & S. F. Clarkson	—	The frontage of the building is about 55ft., and the depth from north to south 138ft. The basement is used for stores, &c., and a residence for the librarian is put upon the upper part next Commercial Road. The accommodation on the ground floor consists of a lofty news-room for seventy readers, 27ft by 38ft., magazine and reference rooms being placed to the south of the site. The lending library is placed in the centre of the building. The walling is of yellow-stock brickwork, with Portland-stone enrichments.

(To be continued.)

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, 9, *East Harding Street, E.C.*

THE LONDON
OF OUR
FORE-FATHERS

is rapidly disappearing, and many picturesque bits of Old London have already been demolished to make room for modern requirements.

The following Photogravures (reproduced by the Rembrandt Process), from originals by Mr. F. L. Emanuel, form a lasting record of many of these interesting buildings.

No further copies can be published, as the plates have been destroyed, and the pictures are therefore quite unique.

Single Copies at the following Prices :—

1. **The "Old Horse and Groom,"** Back of Holborn - above - Bar (since demolished).	6d. each.
2. **Holywell Street,** from St. Clement Dane's Church (since demolished).	2s. 6d. each.
3. **The "Old Bell,"** Holborn (since demolished).	1s. 6d. each.
4. **Leather Lane,** Holborn.	1s. 0d. each.
5. **Davies Street** (since demolished).	9d. each.
6. **Fetter Lane,** View from Holborn.	6d. each.
7. **King Street,** Westminster (since demolished).	1s. 6d. each.
8. **Staple Inn,** Holborn.	2s. 6d. each.
9. **Milford Lane,** Strand, and Booksellers' Row, looking West (since demolished).	6d. each.
10. **Lincoln's Inn Fields.**	1s. 6d. each.
11. **Archway,** Portugal Street, Lincoln's Inn Fields.	9d. each.
12. **Old Houses in Strand.**	6d. each.

Coming Events.

Wednesday, June 3.
NORTHERN ARCHITECTURAL ASSOCIATION.—Visit to the Consett Iron Works.

Thursday, June 4.
CHEMICAL SOCIETY.—Meeting at 8 p.m.

Sunday, June 7.
INSTITUTE OF SANITARY ENGINEERS, LTD.—Visit to the new Naval Hospital at Chatham.

Monday, June 8.
ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Business Meeting. Annual Elections at 8 p.m.

SOCIETY OF ENGINEERS.—Ordinary Meeting at, 7.30 p.m.

Tuesday, June 9.
R.I.B.A. EXAMINATIONS commence.

Wednesday, June 10.
INSTITUTE OF SANITARY ENGINEERS, LTD.—Meetings of General Purposes and Finance Committee at 4.15 p.m., Election Committee at 5.15 p.m., and half-yearly General Meeting at 7 p.m.

Thursday, June 11.
SOCIETY OF ANTIQUARIES OF LONDON.—Meeting a 8.30 p.m.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—Mr. Joseph Offord on "A Forgotten People the Hittites."

Saturday, June 13.
EDINBURGH ARCHITECTURAL ASSOCIATION.—Annual excursion to Bamborough Castle and Church.

Wednesday, June 17.
CHEMICAL SOCIETY.—Meeting at 5.30 p.m.

Thursday, June 18.
SOCIETY OF ANTIQUARIES OF LONDON.—Meeting at 8.30 p.m.

SOCIETY FOR THE ENCOURAGEMENT OF THE FINE ARTS.—Annual Dinner.

Monday, June 22.
ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Presentation of the Royal Gold Medal, 8 p.m.

New Companies.

CROMPTON & CO. (CROSTON), LTD.—Brick and tile manufacturers, stone and flag merchants. Capital: £5,000 in £1 shares.

GRANITE FLAG CO., LTD., concrete flag manufacturers, dealers in artificial stone, bricks, tiles, pipes, &c. Capital: £2,000 in £1 shares.

LAND DEVELOPMENT AND PROPERTY CO., LTD., 60, Coleman Street, E.C. Capital: £200,000 in £1 shares (100,000 five per cent. cumulative preference).

LONDON PRESSED HINGE CO., LTD., hinge manufacturers, tool makers, &c. Capital: £6,000 in £1 shares (2,000 preference).

MELLOWS & CO., LTD., roof glazing manufacturers, plumbing contractors, &c. Capital: £50,000 in £1 shares (25,000 five per cent. cumulative preference).

NATAL COAL TRUST, LTD., brick, tile and pipe manufacturers, &c., 65, London Wall, E.C. Capital: £150,000 in £1 shares.

ROBERT KEARSLEY & CO., LTD., varnish, japan and colour manufacturers and merchants, York Road, Ripon Capital: £140,000 in £10 shares (4,500 preference).

SUSSEX BRICK AND ESTATES CO., LTD., brick, tile and terra-cotta manufacturers, builders, &c. Capital: £100,000 in 10s. shares.

ARTILLERY AND ALBION CEMENT CO., LTD., cement manufacturers, &c., Greenhithe, Kent Capital: £20,000 in 15,000 preference shares of £10 each and £5,000 ordinary shares of £1 each.

BLIVET SOUND-PROOF FLOORING CO., LTD., joiners and manufacturers of flooring, timber merchants, &c., Albert Buildings, Queen Victoria Street, E.C. Capital: £20,000 in £1 shares.

B. J. PARKES, LTD., joinery and cabinet manufacturers, timber merchants, &c., Spring Head, Wednesbury. Capital: £2,000 in £1 shares (1,000 six per cent. preference).

Fresh Archaeological Discoveries. WITHIN the last decade archæological explorers have made a wonderful series of discoveries on the sites of the early civilizations of the world. Crete especially has furnished astonishing finds. From time to time we have notified Dr. Evans's discoveries there; now still more discoveries have been made during the fourth season's work, notably the uncovering of "the germ of all future theatres" and of a smaller palace outside the main building. The details of these discoveries are before us, but from lack of space we are obliged to hold them over. Announcements of important discoveries at Nippur and Beni Hasan are also to hand. At the former site the American expedition under Professor Hilprecht has been singularly successful in excavating the great Temple of Bel, the results of which modify all previous conceptions of a Babylonian temple; while at Beni Hasan a gallery of smaller rock tombs than those which make the hillside famous have been discovered—the doors of some of the tombs explored were now opened after having been closed for 4,000 years' We shall publish the details of these important discoveries as soon as we can find the space to do so.

———

For Art in South Africa. WHILE the country is still tremulous with the effects of a fierce war, while the problem of labour is still engaging the closest attention, while speculators are working for no other end than money-making, it seems rather incongruous to talk of a Society for the Encouragement of Art in South Africa; yet such a society has been formed under the ægis of Sir William Richmond, with the support of Sir Edward Poynter, Mr. G. F. Watts, Sir John Stirling-Maxwell and Lieut.-General Sir John French. The object is to provide a comprehensive art education, including crafts, by the foundation of an academy of arts. "The development of native talent, undoubtedly latent in the Boer, an offspring of a nation which has ever been foremost in art, having produced some of the greatest painters in the world, is certain to be an important element in the elimination of racial feeling and the subsequent fusion of the two peoples." It is proposed to found a school of art at Johannesburg on similar lines to the Academy and Royal College of Art schools, and to organize an exhibition of pictures by British and Dutch masters; indeed, the whole meaning of "art" seems to have been narrowed down to painting. It is a painters' movement, and we are not therefore surprised to find architecture left alone; yet this of all the arts in a newly-constituted country deserves the first and greatest attention, especially when we remember the individual style of the Dutch settlers. A fusion of that style with British ideas would be the best effort that any society for the encouragement of art in South Africa could foster.

———

Opus Sectile. THERE is a disadvantage in the use of mosaic for the decoration of a surface which is near the eye in that the difficulty of rendering the most important portions of figures with tesseræ of an average size is great, while a sufficient reduction in their size to enable the drawing to be satisfactorily expressed causes the portions in which the smaller tesseræ are employed to stand away from the rest of the surface by reason of the difference in texture. This difficulty was apparently felt by the ancients, and they adopted two means to overcome it. They either worked the whole subject in small tesseræ (which was the beginning of the pictorial treatment so unsuited to large decoration in mosaic) or used a combination of tesseræ and shaped pieces of marble or glass upon which lines were often incised or painted. This kind of mosaic was called "opus sectile" (or "scalpturatum" when the lines were incised), and though scarcely any perfect examples have come down to us, the soil of vineyards near Rome which occupy the sites of ancient villas is full of detached fragments of glass which have formed part of such decorations. Modifications of the process have been used in more recent times, where the desire for an absolutely permanent decoration has caused the rejection of the various forms of painting, and experience has shown the defects of the usual treatment of mosaic in situations where the wall can be approached closely; it therefore seems probable that in the hands of capable designers, who can also supervise the execution of the work, quite satisfactory results may be obtained by the admixture of "opus sectile" with mosaic. The drawback is generally the evenly vitrified surface of the material, which is rather harsh and unsympathetic and insists upon attention when the pieces employed are at all large. Mr. H. Holiday has lately been showing his friends a panel executed in "opus sectile" for a mission church in Mansford Road, Bethnal Green, as a memorial of a charitable lady. The subject chosen by the donors was "Charity," and the treatment desired was somewhat pictorial. Two female figures descend an external staircase having a light railing to minister to the aged and the poverty-stricken. The coloration is kept pale and light, with a reminiscence of Early Italian frescoes. One of the ministrants wears a blue robe and the other a cloak of a pale flame colour over a redder underdress; both of these have a pattern rather suggested than completed, just so as to break up the flatness of the material. Behind is a standing figure of an old man leaning on a staff, clad in a greenish cloak, whose head is characteristic and individual, and a half-clothed figure in front wears purple rags. Behind are the tops of houses and churches relieved against the blue of the sky. With the exception of the patterns already mentioned, the lines of architecture, drapery and flesh, and the slight tinting of the flesh, suggesting modelling and very successfully treated, the material is untouched. The panel is surrounded with a narrow repeating border painted in green upon white and will be isolated on the wall by a row of enamelled whitish squares and a beading of wood. The material lends itself even more successfully to a more strictly decorative and architectonic treatment, and one rather wonders it is not employed more often. Another work which is just completed in the same studio is a lofty window for Glasgow University with figures of great astronomers—Copernicus, Kepler, Galileo and Newton—and literary men—Raleigh, Burns, Byron and Carlyle. The figures are relieved against rectilinear plaques of very rich colour upon a ground of arabesques in pale greens and greenish blues. Much of the glass is very splendid as material, especially those portions made by Mr. Holiday in his own workshops, and the difficulties of costume have been well met.

———

Echoes. MR. CHARLES J. BISHENDEN suggests that gauze wires should be fixed crossing one another under the dome of St. Paul's Cathedral so as to break the many echoes. He says: "When I sang at the Royal Albert Hall the day it was opened by her late Majesty the music caused quite a confused mass of sound, but some years afterwards when singing in the hall the wires placed under the glass roof enabled me to be distinctly heard in every word of my songs as far as the galleries. This same improvement could be made at St. Paul's Cathedral."

GLASGOW ROYAL INFIRMARY.

The Institute and the Managers.

THE managers of the Glasgow Royal Infirmary having finally rejected the criticisms of the Glasgow Institute of Architects regarding their rebuilding scheme, and refused the advice and assistance offered by that body, the Institute has felt it to be its duty to set the whole facts before the general public. From 1897, when the scheme was first mooted, till the end of 1899, the managers were engaged in endeavouring to obtain satisfactory plans from an architect selected (despite outside and inside criticism) by themselves, but those were finally set aside and a competition instituted. This was undertaken in January, 1900, when ten selected architects were invited to send in designs, Dr. (now Sir) Rowand Anderson being appointed assessor. Undeterred by previous failure, however, the managers (together with the Executive Committee now acting with them) first proceeded to have a species of preliminary competition among themselves, and as the result produced and issued to the competitors two "suggestive and illustrative" sketch plans. Of both of these the "Jubilee block" fronting Cathedral Square was an essential feature. The general lines of the sketch plans thus produced, and especially the situation of the Jubilee block, were found so radically faulty by most of the competing architects that all of them who had a previous reputation as hospital experts found it necessary to depart more or less entirely from them in the designs they submitted. Of the ten designs the assessor made a short leet of four, and a final selection of one, which he recommended for adoption. The Committee, influenced apparently by their own sketch plans and their "own opinion as to style of architecture," set aside the award, and chose a design, outside even the short leet, which was simply a more fully detailed copy of their "suggestive" draft.

The Glasgow Institute of Architects in May, 1901, addressed to the managers its first protest and appeal, criticising both the way in which the competition had been decided and the result arrived at, objecting to the whole arrangement of the selected plan as inadequate and out of date, and to the Jubilee block as shutting out the sun and air from the south, as well as at the same time vitally injuring the appearance of the Cathedral, and, finally, requesting that the whole of the plans should be submitted to one or more hospital experts before anything further should be done. To this no reply was received beyond a formal acknowledgment and reference to an official statement to the public which appeared in the press on May 18th, 1901. In this the criticisms of the Institute were in no way answered, and its suggestion of expert assistance was ignored, but it included (with reference to points raised elsewhere) the important statement that the managers now recognized "that the new hospital and not a section of it (*i.e.*, the 'Jubilee block') should be regarded . . . as a fitting memorial to the sixty-three years' illustrious reign of the Queen."

In June of the same year the Institute again addressed the managers, reaffirming its criticism, and offering to bear the expense of the course suggested should its opinions not be borne out. To this no reply was received.

On several occasions during the past winter, and especially at the annual general meeting of the infirmary, it was stated that the original scheme was to be retained *in toto*, and the work pushed on with vigour. Accordingly the Institute thought it necessary once more to draw the managers' attention to the fact that no adequate replies had been received to its previous communications, and to press for an answer, with the result only that it was assured by the managers that it was their intention, after the plans had been more fully developed, to submit them to "experts—surgical, medical, and mechanical."

This the Institute, in reply, pointed out would in no way meet the difficulties raised, that expert guidance would then come too late, and might well be set aside as at the first stage of the proceedings. To this last appeal the secretary has replied closing the correspondence.

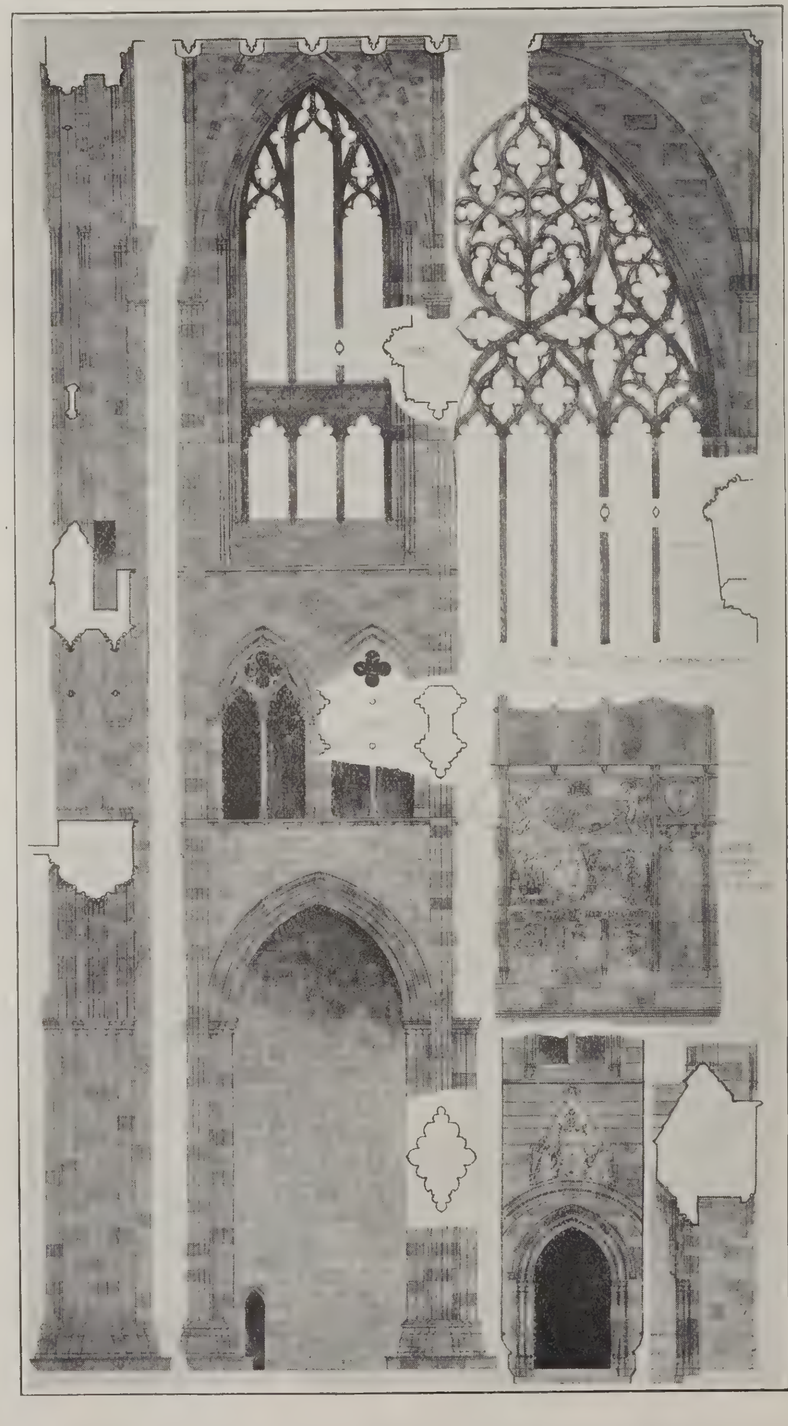
The Manchester Hospital for Skin Diseases will shortly be commenced in Quay Street. The plans of Messrs. T. Worthington & Sons, of Brown Street, Manchester, the architects, were selected in competition. Accommodation will be provided for thirty in-patients. The new buildings will be faced with Runcorn stone and brick. They will probably cost about £22,000. The sum of £13,000 has already been paid for the site.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Water in Basements.

LONDON, E.C.—TOO MUCH AQUA writes: "The accompanying drawing (not reproduced) shows a heating chamber in the basement of a block of offices which I am building. It has walls of stock brickwork 1ft. 11in. thick, set in mortar, with a 5in. concrete floor. This is all that has been executed to date, as the foundation consists of a running bed of sand. There is now between 3ft. and 4ft. of water standing in it. It was my intention before seeing the foundation to finish the chamber with a 4ft. 2in. brick



DESIGN FOR LIVERPOOL CATHEDRAL: DETAILS OF CHOIR. W. J. TAPPER, ARCHITECT.

lining, with a 3in. cavity between it and the main wall, and to finish the floor with 2in. of granolithic cement, but as the water rises from below the granolithic would not set on account of the upward pressure, so I have abandoned this. I shall be glad if you can advise me as to the best method of making this chamber watertight in as inexpensive a manner as possible."

Land drains should have been placed under the site to carry the water away easily and to relieve the pressure, but in the circumstances we think you can remedy the trouble by keeping the water out while doing the necessary work by compressed air. Then put a $\frac{3}{4}$in. sheeting of trowelled asphalt on the concrete floor and brick walls, and inside this build a $4\frac{1}{2}$in. face of brickwork and a 4in. concrete paving *in situ*, the walls and floor being finished with cement *trowelled* to a neat face. It would also be an advantage, if there is underground running water, to sheet-pile the site. The various methods of dealing with difficult foundations are dealt with somewhat fully in the "Excavator" section of "Specification, No. 6," to be obtained from the Publisher, Technical Journals, 6, Great New Street, E.C., price 5s. 9d., post free.

The Architects' Registration Bill.

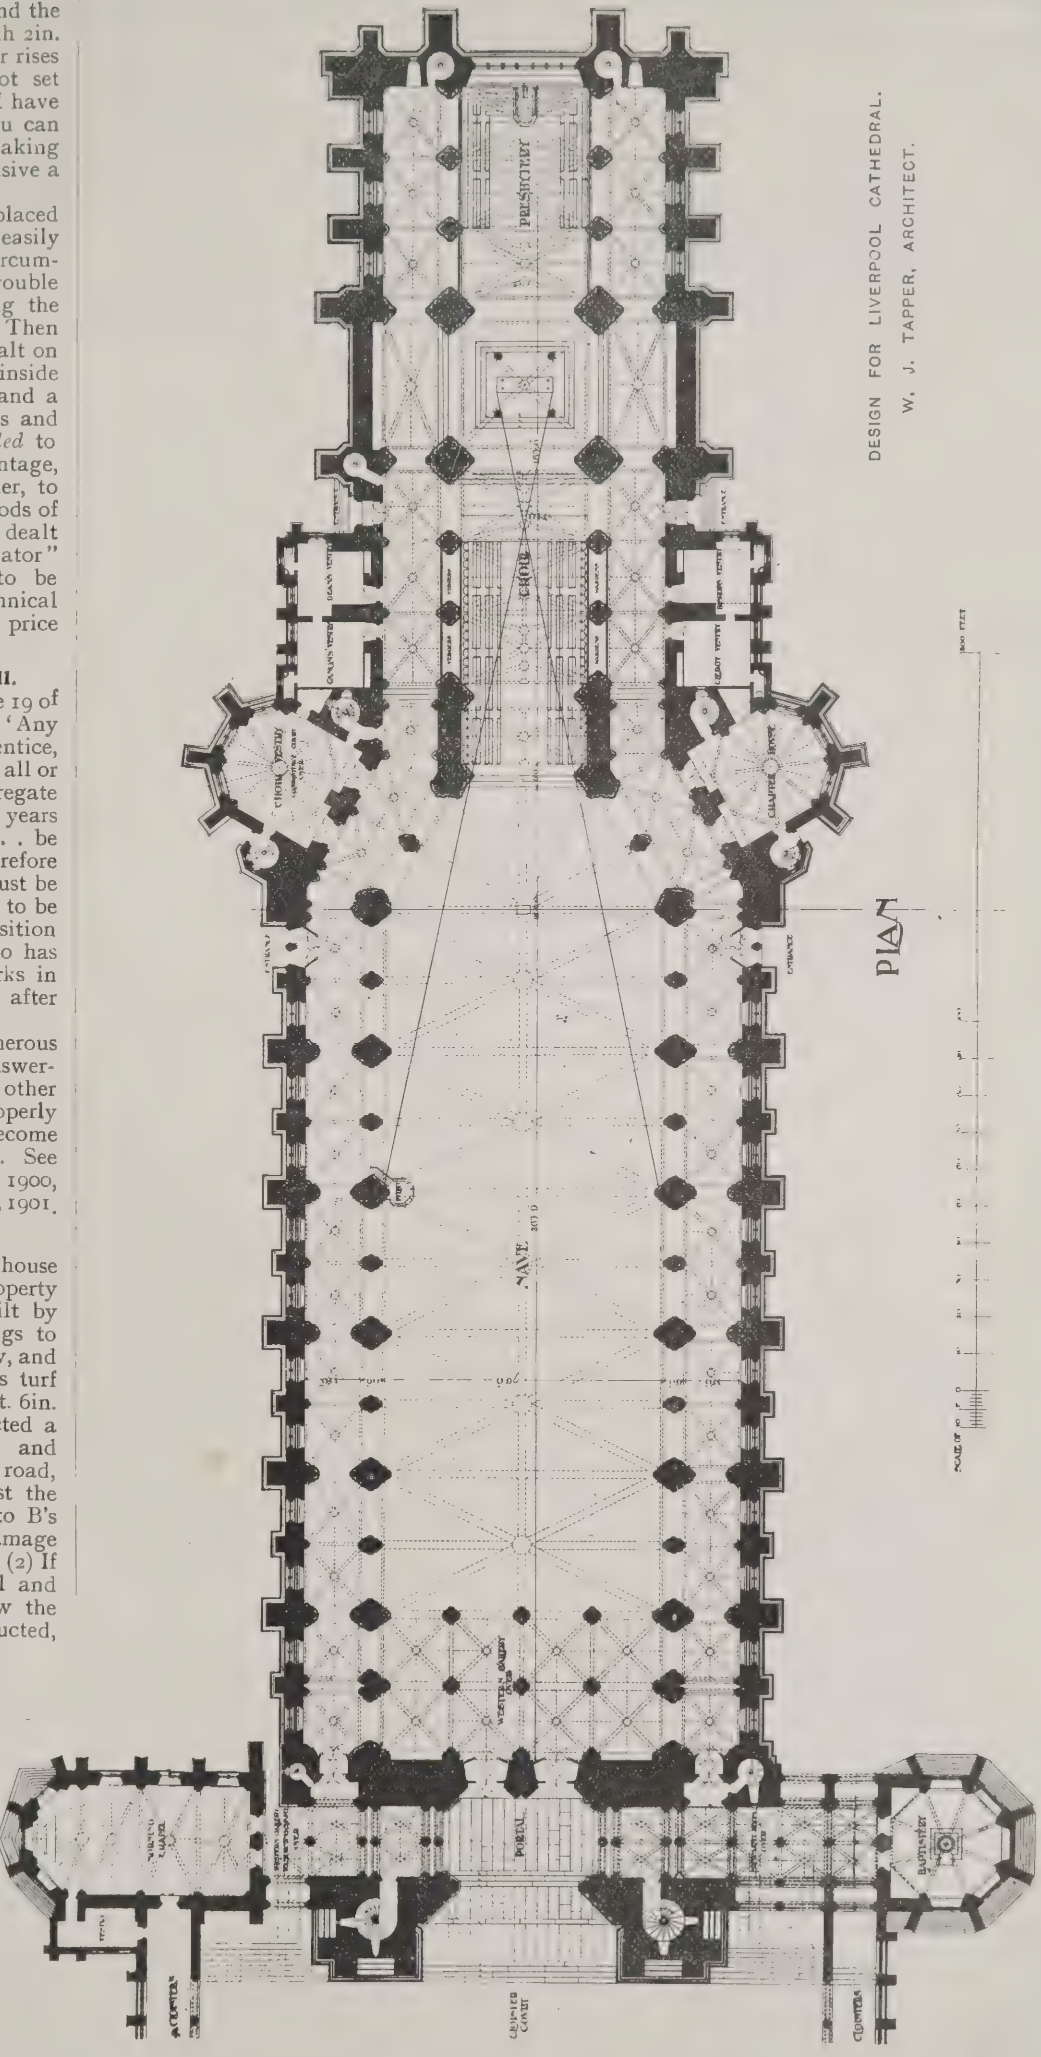
CORNWALL.—RONNE writes: "Clause 19 of the Architects' Registration Bill states: 'Any person . . . . who has served as apprentice, assistant or practitioner in architecture, all or either, for twelve years in the aggregate after having attained the age of fifteen years prior to the passing of this Act shall . . . be registered.' Is it to be understood therefore that an architect without a diploma must be twenty-seven years of age to be entitled to be registered? If so, what will be the position of a young architect, uncertificated, who has established a fair practice, and has works in hand that will not be completed until after January 1st, 1904?"

We have already replied to numerous enquiries about this Bill. To go on answering them over again, and to reply to other questions, when the Bill is not properly before Parliament—much less likely to become law—is a mere waste of time and space. See p. 324 of our issue for November 21st, 1900, and p. 426 of our issue for January 2nd, 1901.

Support to Adjoining Property.

SALOP.—G. D. L. writes: "A built a house on a piece of land adjoining. The property is divided by a 9in. retaining wall built by B nine or ten years ago. The footings to this retaining wall were very shallow, and A came to them when he took off his turf and top soil. The footpath is about 2ft. 6in. below A's ground, and A has constructed a footpath along the side of the wall and sloped it down to the footpath in the road, with the result that at the end nearest the road he has taken away the support to B's wall. B holds A responsible for any damage that may occur. (1) Is A responsible? (2) If so, and he agrees to underpin the wall and take the footings down to 12in. below the level of the footpath he has constructed, should A also build piers?"

As A, for his own benefit, has altered the natural ground in such a manner as to endanger B's property, there is no hardship involved when B asks to be placed in as good a position as he occupied before A's alterations, and the answers to your questions are therefore:—(1) A is responsible. (2) If piers be reasonably necessary to ensure stability, A should build them. I advise that, prior to any building work being commenced, A and B should agree in writing exactly what A should do, or possibly after A has executed the work he considers necessary B may demand further expenditure. G. S. M.



DESIGN FOR LIVERPOOL CATHEDRAL.
W. J. TAPPER, ARCHITECT.

Keystones.

Mr. W. Howard Seth-Smith, F.R.I.B.A., of 46, Lincoln's Inn Fields, London, W.C., has had his telephone number altered from "832 Holborn" to "4924 Holborn."

Partnership.—Mr. R. Walker, F.R.I.B.A., architect, of Windermere, has taken into partnership with himself his son, Mr. Frank H. Walker, and Mr. James Carter, of Windermere, late of Darwen. The practice will be continued as usual at Windermere under the style of Walker, Carter & Walker.

A New Hotel at Newcastle, to be called "The Empress," is being erected at the corner of Dean Street and the Side. The total frontage will be about 660ft. The cost will be about £120,000. Mr. Stephen Easten is the contractor, and Messrs. Oliver, Leeson & Wood, and Messrs. Marshall & Tweedy, of Newcastle, are the joint architects.

Old Doorways.—Mr. B. T. Batsford is about to publish an interesting volume illustrating old English doorways from Tudor times to the end of the eighteenth century, reproduced from photographs specially taken by Mr. W. Galsworthy Davie, whose delightful volume on "Old cottages and farm-houses in Kent and Sussex" has been so widely appreciated. The photographic plates will be supplemented by some historical notes and sketches by Mr. Henry Tanner, junr., author of "English Interior Woodwork."

A Roman Altar.—At the last meeting of the Newcastle Society of Antiquaries Mr. R. Oliver Heslop described a Roman altar which workmen employed by the Tyne Commissioners had found embedded in the river bottom. He said it corresponded with an altar already possessed by the Society, which was found during operations for the swing bridge. The two altars probably formed the right and left sides of a sanctuary dedicated to the deities typified on the faces of the stones. Both were found on the site of the old Roman bridge.

The Dundee Institute of Architecture recently visited Arbroath. Under the presidency of Mr. A. A. Symon the party were first conducted over Messrs. Keith & Blackman's heating and ventilating works, and afterwards visited the Abbey. There the president read an interesting paper on its history, pointing out the parts erected at the various dates. The lately rebuilt parish church was next gone over, and much admired. The Frazer Chapel in the cemetery, with its wonderful carvings, was next visited, and subsequently Hospitalfield, the residence of the late Mr. Patrick Allan Frazer, now transformed into a school of art.

Admiralty Appointments. — Among the posts in the Civil Service that offer opportunities to persons architecturally inclined are those in the Admiralty Works Department, which is responsible for the design and construction of all engineering and architectural works in the naval establishments at home and abroad, as well as for their care and maintenance. A little pamphlet just issued sets out the salaries. In addition to two Assistant Directors of Works at £1,000 to £1,200 a year, there is an engineering staff with salaries ranging from £200 to £850, and a large surveying staff. Entries to the staff are made in the lowest grades by open competitive examination held by the Civil Service Commissioners, whose office is in Burlington House, Piccadilly. Particulars may also be obtained from the office of the Director of Works, 21, Northumberland Avenue, W.C.

New Headquarters for the Essex Constabulary are being erected on the top of Springfield Hill, Chelmsford. The buildings are grouped in the form of a crescent, and stand back about 400ft. from the main road to Colchester. They are constructed of red brick and white stone, with red-tiled roofs. Messrs. Clare & Ross, of Chelmsford, and 1, West Street, Finsbury Circus, E.C., are the architects, having been successful in an open competition against thirty competitors. The total cost of the buildings will work out to about £18,000. The builders are Messrs. Smith & Son, of Witham; electric lighting and engineering work generally by Messrs. T. H. P. Dennis & Son, of Chelmsford; and the furnishing by Messrs. Hampton & Son, of Pall Mall. The quantity surveyor was Mr. J. S. Parmenter, of Chelmsford and Ipswich.

Liverpool Pierhead Baths. — Alderman Maxwell, chairman of the Watch Committee of the Liverpool Corporation, suggests that a handsome block of buildings for tramway and other offices might be erected, and a complete scheme for public baths, &c,, might be constructed, so to speak, upon the top storey or roof. He contends that the baths will thus be in a position of the least value as far as site is concerned, leaving the whole of the floor below free for offices which would bring in a good rent. "Of course the water would have to be pumped up to supply the baths, and the overflow water might well be used to run hydraulic lifts. Further, an arrangement could be devised so that the water of the baths could be connected with a complete system of automatic sprinklers through the whole building. This would materially reduce the risk of fire, and should considerably reduce the insurance premiums. As only a comparatively small portion of the roof would be required for the bath establishment, the balance, or part of it, could be utilized for a café and roof-garden in connection with it."

BRICKMAKING.

The new Fiske System.

In a paper read before the American Ceramic Society Mr. J. P. Fiske recently described the process of brick manufacture now in operation at the works of the Fiske Brick Co., Dover Point, Newhaven. At these works the semi-plastic process is adopted, and the method followed is the ordinary one until the bricks are delivered from the press on to the belt conveyor belonging to the machine. From this belt they are at present transferred by hand (though the machinery for transference has been devised) to one or other of two setting-up racks; but from this point onwards the bricks are untouched by hand till delivered into store or delivery waggon. The essential feature of the Fiske system lies in the fact that the bricks are handled in mass and not separately. The setting-up racks consist of 150 wooden bars about 20in. long, arranged parallel to each other at a convenient height. These bars are spaced 1½in. apart, and are of such a width that a brick laid across them as a stretcher is supported at its middle and at both ends. The first layer of the unit stack of bricks consists of five rows of stretchers extending from end to end of the rack. These rows are spaced 1in. or so apart, and on them is next placed a layer of headers, also loosely spaced. Another row of stretchers follows, and so on, till there is a stack six bricks high. When complete the whole stack of 1,500 bricks is lifted as a single unit by means of an electric crane fitted with a special brick-lifter. This lifter has a series of 149 steel fingers, which can pass in between the wooden bars of the setting-up frame and underneath the bottom row of stretchers, enabling the whole stack to be lifted and handled as a unit. This unit is transferred to the drying kiln, where it is deposited on a similar rack to the setting rack, but built of iron instead of wood. In this kiln the bricks are dried by hot air, and when ready are transferred to the burning kiln. The floor of this is fitted with a firebrick rack, on which the first layer of unit stacks is deposited. On this layer other stacks are deposited, the fingers of the brick-lifter passing into the spaces between the headers of the stacks already in place. After burning, the crane and brick-lifter are again used to transfer the finished bricks to store and pile them up there. Both kilns are, of course, specially designed for being worked by means of the brick-lifter. The burning kiln consists of several chambers, which are worked on the continuous system. Each chamber has a removable cover of concrete and iron, and is filled and emptied from above.

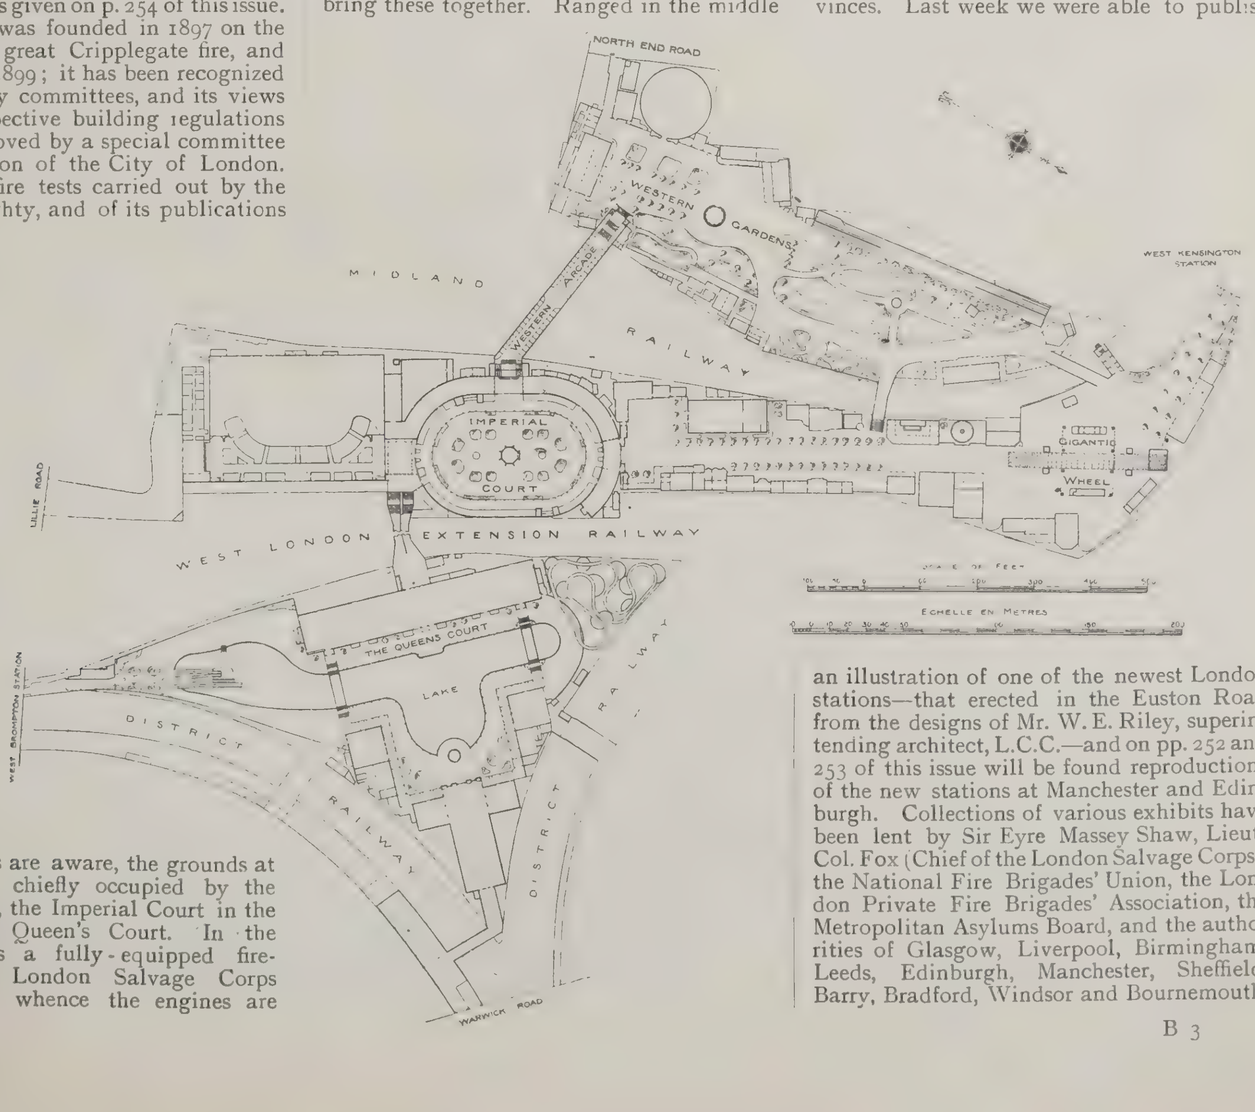
Law Cases.

Electric Street Boxes as "Buildings."—At the Mansion House Police Court the Charing Cross and Strand Electricity Supply Corporation were recently summoned for constructing an underground chamber for electric wires at the corner of Mincing Lane and Fenchurch Street without first serving a notice under the London Building Act, 1894. There were six similar summonses in respect to chambers in other parts of the City. They had been adjourned from time to time pending a decision of the High Court as to whether the underground chambers were "buildings" within the meaning of the Act. Mr. Bale, solicitor, in support of the summonses, said the chambers were 7ft. or 8ft. square. The case in the High Court had been decided against the defendants. The matter now merely resolved itself into a question of penalties and costs. Mr. Daldy, for the defendants, said that this was not a case of an offence. People were justified in doubting whether an electric-light box in the street, which was really nothing more than a local enlargement of the electric conduit, was a building coming within the Act. Sir Joseph Savory asked what penalty was imposed by the magistrate at the Guildhall. Mr. Daldy replied that the penalty was 1s. on each summons. Sir Joseph Savory said he thought that a nominal penalty of 1s. on each summons would suffice. He should make an order for £10 10s. costs on the first summons.

The Supervision of Buildings by Architects.—The case of *Steljes* v. *Ingram* recently came before the Court of Appeal. This was an application by the defendant for a review of taxation of the costs of an action in which the plaintiff sued the defendant, in his capacity of an architect, for negligence in supervising the erection of a building. The action was tried before Mr. Justice Grantham and a special jury, when the plaintiff was awarded £20 damages, the learned judge declining to make a special order as to costs. The costs were subsequently taxed on the assumption that the action was "founded in tort" and amounted to the sum of £329. In concluding his judgment Mr. Justice Phillimore said: "The defendant is sued because he undertook to supervise the erection of a house with due care and skill, and because he did not fulfil his undertaking. No other question except that of damages was in issue. Looking at the case in another way—(*a*) the case was not launched for a breach of duty; (*b*) assuming that an architect's profession is one to which it may be said that appropriate duties are attached by the general law (which I doubt), it is not alleged, nor do I know that the particular acts complained of would-be acts which fall within that general scope of duty; and (*c*) lastly, if they were, that might be reason enough to support an action in tort where the forms of action were material, but not enough to make the substance of the matter tort. The appeal must be allowed, with costs."

THE INTERNATIONAL FIRE EXHIBITION.

THE International Fire Exhibition now open at Earl's Court, London, S.W., is undoubtedly the most extensive and representative collection of fire exhibits ever brought together in this country. One sees there the whole history of fire prevention and fire rescue, from the days of Rome to modern times. Such a result would only be possible with the hearty co-operation which the authorities at home and abroad have extended to the organizers of the exhibition, and it needs but a glance at the long list of distinguished names on the several committees to appreciate how comprehensive the exhibition has been made and how influential it is likely to be all over Europe. The inception of the exhibition is due to the British Fire Prevention Committee—of which Mr. Edwin O. Sachs is the chairman—a committee which has already done great service to constructors and to the public by the impartial and strictly accurate tests which have been carried out with various materials and systems. These tests are conducted at the Committee's new station at Westbourne Park, in brick huts supplied by a large gas main and connected with Roberts-Austen pyrometers for recording the heat: a view of the huts is given on p. 254 of this issue. The Committee was founded in 1897 on the occasion of the great Cripplegate fire, and incorporated in 1899; it has been recognized by Parliamentary committees, and its views regarding retrospective building regulations have been approved by a special committee of the Corporation of the City of London. The number of fire tests carried out by the Committee is eighty, and of its publications seventy-three.



As most persons are aware, the grounds at Earl's Court are chiefly occupied by the Western Gardens, the Imperial Court in the centre, and the Queen's Court. In the Western Gardens a fully-equipped fire-station of the London Salvage Corps has been erected whence the engines are driven into the Empress Theatre during the progress of the great fire spectacle there—"Fighting the Flames." The feature of this dramatic show is the burning of a four-storeyed warehouse at the corner of two converging streets and the rescue of the inmates. The manner in which the fire is conducted is astonishingly realistic; the flames shoot upwards in great size, and volumes of water are pumped into the building from the numerous steamers. Even to those familiar with stage settings the result is amazing, for huge flames and immense quantities of water are strangely difficult to deal with. Few persons, indeed, are aware how the spectacle is conducted without damage, and it is therefore of interest to note that the floors of the building slope downwards and have gutters at the bottom which carry off the water, while numerous gas pipes are provided to produce the sheets of flame.

In the colonnade around the Imperial Court are exhibits of various firms, to which reference will be made later. In the galleries behind the western side of this court a most interesting collection of curios, historical relics, photographs, engravings, &c., is exhibited. Much labour has been required to bring these together. Ranged in the middle of the rooms are old fire-engines, squirts and other antiquated appliances, such as a two-man manual dating from 1626, when it was necessary to obtain permission from the mayor or the beadle before it could be used! The manual was carried to the fire on hand poles and shoulder straps. But even this was a wonder of effectiveness when compared with the bucket and squirt. We see an improved form of it in Hogarth's engraving "The Times," where the great artist has persisted in his satire and demoniacal wrongness of everything.

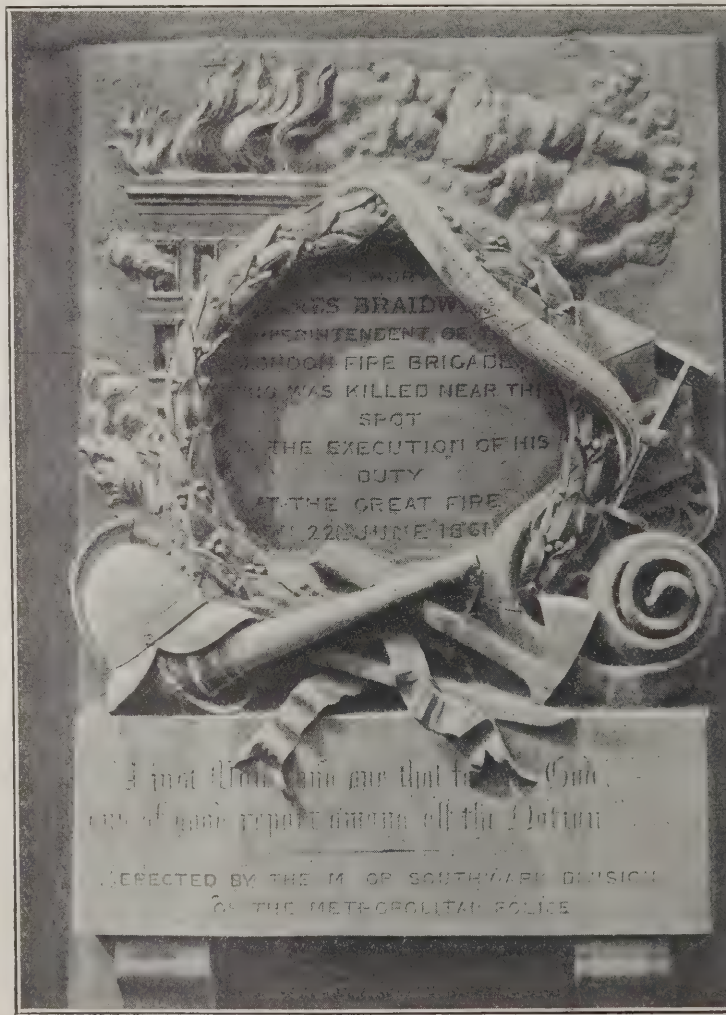
Among the large number of pictures, engravings and photographs hung in these galleries at the back of the Imperial Court are some fine water-colour drawings, by Mr. R. Phené Spiers, of the ruins of Paris after the Commune (1871), showing how complete was the work of the wreckers on the Tuileries, the Palais de Justice and the Hotel de Ville. Numerous photographs are exhibited of buildings gutted by fire—one, especially striking, of some buildings in St. James's Street, Montreal, where the water froze in great masses of icicles. Attention is drawn to the photographs of new fire-brigade stations in London and the provinces. Last week we were able to publish an illustration of one of the newest London stations—that erected in the Euston Road from the designs of Mr. W. E. Riley, superintending architect, L.C.C.—and on pp. 252 and 253 of this issue will be found reproductions of the new stations at Manchester and Edinburgh. Collections of various exhibits have been lent by Sir Eyre Massey Shaw, Lieut.-Col. Fox (Chief of the London Salvage Corps), the National Fire Brigades' Union, the London Private Fire Brigades' Association, the Metropolitan Asylums Board, and the authorities of Glasgow, Liverpool, Birmingham, Leeds, Edinburgh, Manchester, Sheffield, Barry, Bradford, Windsor and Bournemouth.

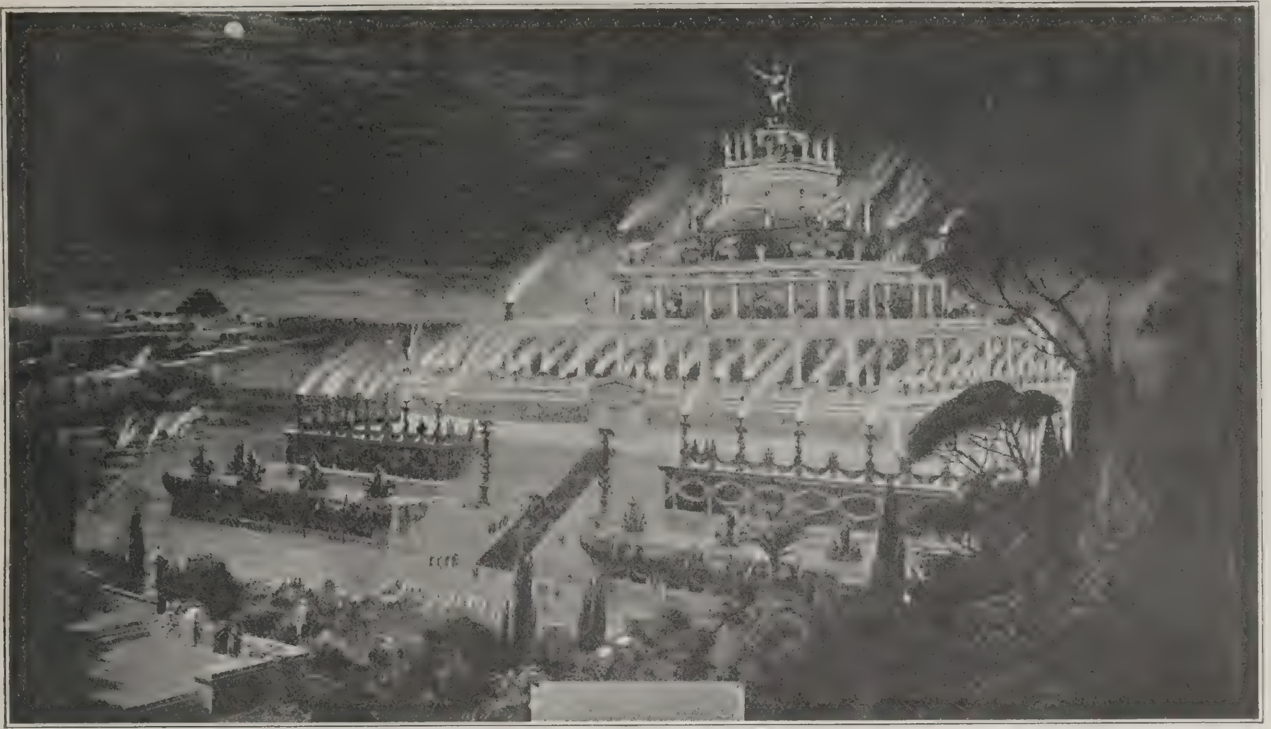
THE "TIMES," BY HOGARTH (1762).

In addition, the British Fire Prevention Committee has lent numerous materials subjected to fire tests, and the Lightning Research Committee has lent a most interesting collection of photographs of buildings struck by lightning.

Among the exhibits will be noticed several relating to James Braidwood, about whom it is fitting to recall a few facts. In May, 1856, he read a paper before the Society of Arts on "Fires; the best means of preventing and arresting them, with a few words on fireproof structures." He expressed a hope that the new Building Act which had come into force on the preceding January 1st would repress some of the great evils that had arisen, but feared that the meaning of the new Act would be "subverted by some such subterfuge as destroyed the efficiency of the previous Act." In this he was truly prophetic, for his life was sacrificed in 1861 in consequence of the application of a subterfuge of the character he had in mind in 1856. The building in Tooley Street which was responsible for the fire of 1861 (at which Braidwood lost his life) rapidly spreading beyond control had been recently erected and very considerably exceeded the limit of 216,000 cub. ft. permissible for such a building. The case was taken by the district surveyor before the magistrate, who considered that the floors constructed with brick arches on cast-iron girders about 13ft. apart, supported on iron posts, constituted party walls and met the requirements of the Act, altogether overlooking the action of fire (among the merchandise in the building) on unprotected iron and the existence of numerous openings through the brick floors. The magistrate's decision was allowed to remain unchallenged until 1892, when a corresponding case was taken to a higher court and a decision given in 1894 that a so-called fireproof floor was not a party wall within the meaning of the Act. On this page is illustrated the Braidwood memorial in Tooley Street. It was erected by the Southwark division of the Metropolitan Police, showing how closely Mr. Braidwood worked with the police, a fact which partly explains how he was able to do so much with the small number of men and appliances under his direct command.

In the large hall of the Queen's Court the chief exhibit is the German official one. It is quite unique of its kind, for it embraces the historical, art, municipal and commercial sides of fire service and fire-prevention in the German Empire. The arrangement of the exhibit has been in the hands of a German sub-committee of considerable influence, formed at the instance of the British Fire Prevention Committee, whose representatives visited Berlin and met with a most hearty reception. The arrangement of the three groups of history, literature and art were undertaken by Dr. Franz Weinitz, of Berlin. Among the large number of pictures are twenty drawings of fire catastrophes of the past lent by the German National Museum in Nuremberg; and other exhibits of special interest are some photographs of the Fire Brigade Monument erected by the City of Berlin, with a striking group (by the sculptor Riesch) of a fireman rescuing a woman and child; and the large canvas by Crown Surveyor Jaffé representing "The Funeral Pyre of Hephæstion" — an architectural restoration of great extent, as will be seen by the reproduction of it on the opposite page. Hephæstion, Alexander the Great's commander-in-chief and his dearest friend from childhood, died suddenly in the royal palace at Ecbatana during the festival in honour of Dionysius. The king caused the body to be carried with great military pomp and ceremony to Babylon, and there, from the design of the architect Demokrates, built the funeral pile here depicted. Alexander and his friends contributed about £2,500,000 to defray the cost of constructing the funeral pile, and about 10 stadia of the walls of Babylon were ordered to be pulled down and the bricks removed to form the foundations. The building was square at the base, east side measuring about 650yds., and rose in five terraces. The lowest terrace was formed of the prows of 240 vessels captured from the enemy, above which stood a row of fully-armed figures with two bowmen kneeling at the feet of each. The second terrace, decked with wreaths at the base, was crowned by a row of magnificent candelabra surmounted with eagles bearing cressets between their wings. On the third terrace were displayed hunting scenes sculptured in relief. On the fourth terrace stood the figures of fighting centaurs in solid gold. And, finally, on the fifth terrace were pairs





THE FUNERAL PYRE OF HEPHAESTION. A RESTORATION BY CROWN SURVEYOR JAFFÉ.

of winged bulls in gold. The summit was ornamented with trophies of arms and hostile spoils, within which hidden figures of sirens and musicians sang the funeral dirge of Hephæstion, whose statue of gigantic proportions crowned the edifice. The entire army of Macedonia, with the king at its head, took part in the sacrifices and funeral ceremonies.

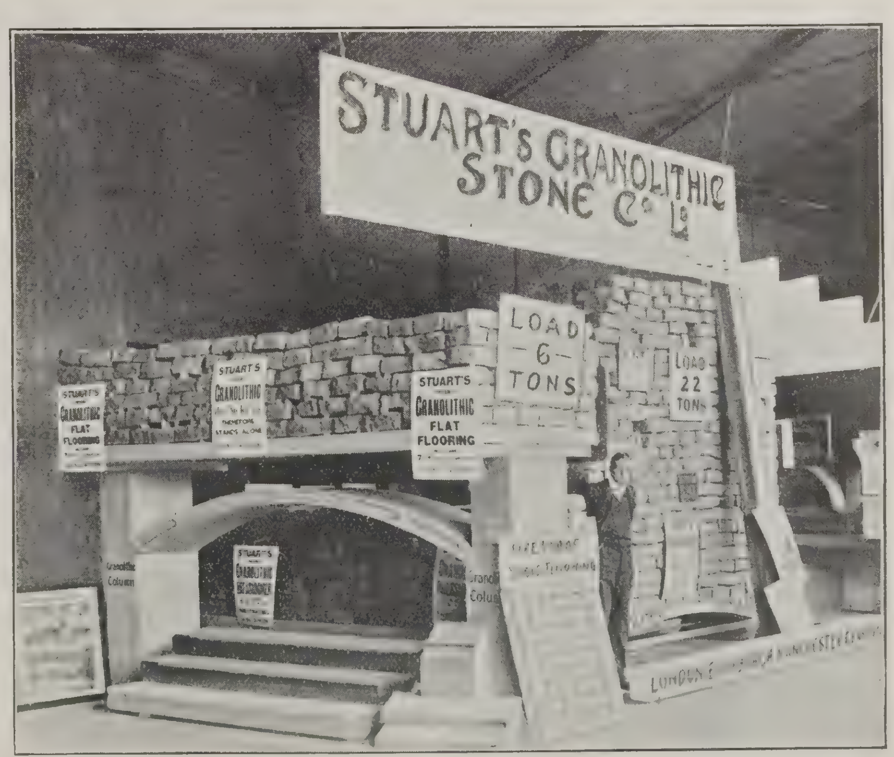
Among the modern exhibits in the German Court are, of course, all kinds of fire appliances, as well as some plans of a new fire-station in Berlin, the ground-floor plan of which is given on p. 254 of this issue.

Having thus briefly described the official and semi-official exhibits we may refer to the trade firms who show all their latest systems and devices. These are grouped, for the most part, around the Imperial Court and in the gallery of the Queen's Court. Taking the former first, we notice on entering the exhibit of Stuart's Granolithic Stone Co., Ltd., consisting of some floors heavily loaded with granite setts—one, an arch of 9ft. span, with a thickness of 3in. at the crown and $8\frac{1}{2}$in. at the springing, carrying a dead load of 22 tons. The material consists of Dalbeattie granite crushed and mixed with Strood cement, moulded, and allowed to set. We have lately had occasion to describe more fully the preparation and handling of this well-known material at the firm's works at Millwall Dock, so that there is no occasion to repeat the details: suffice to say that floors, walls and staircases can be formed of Granolithic which, while being extremely light, are able to withstand the greatest stresses. The material is much used in all parts of the kingdom. On this stall also are a piece of fireproof stable flooring made of Granolithic and some coloured specimens of the material.

We next come to the stall of Messrs. J. A. King & Co., of 181, Queen Victoria Street, E.C. (see next page). This is attractively constructed to show the application of the "Mack" slabs to ceilings, floors, walls and other parts; as well as "Mack" fireproof pugging for wooden floors, and "Mack" lathing for encasing columns, girders and stanchions, forming coves, &c. All the slabs shown on the stall have been plastered with "Gypo" fire-resisting plaster; it dries quickly and may be painted about forty-eight hours after being applied, while it has the additional advantage of being very light in weight. Messrs. King are also manufacturers of the British steel corner-plate for forming the external angles in plastering, a device consisting of a galvanized steel rail fixed with metal clips to the brickwork which saves much labour in plastering and does away with the necessity for screeds.

Messrs. Shand, Mason & Co., of 75, Upper Ground Street, Blackfriars Road, S.E., have an extensive exhibit of their steam fire-engines, escapes, ladders, couplings and numerous other accessories. It is worthy of note that the six new Shand-Mason engines just delivered to the Metropolitan Fire Brigade are fitted with a patent device for allowing variable steam-expansion (which reduces weight, economizes fuel, lessens noise and prevents sparks) as well as oil-fuel furnaces. With these engines the Brigade are able to raise a steam-pressure of 100lbs. from cold water in less than $5\frac{1}{2}$ minutes, or where a pressure of 30lbs. is maintained in the boiler by a gas heater 100lbs. pressure can be got within two minutes of lighting the oil burner.

The next stall is occupied by The Shannon, Ltd., of Ropemaker Street, E.C., where all kinds of up-to-date office furniture, letter-filing cabinets, desks, &c., are shown. The firm has latterly erected large new works at Dalston—of which Messrs. Edwin O. Sachs & Hoffman are the architects—fitted with the most modern wood-working machinery driven by electric power; a drawing of it is exhibited in the Architectural Room at this year's Academy.



The Columbian Fireproofing Co., Ltd., of 37, King William Street, E.C., have a very interesting stall. It consists of a curved roof of 12ft. span with a pointed roof on one side and a Mansard roof on the other, each having a dormer formed in it – all on the firm's special system of construction. In forming the arch specially-shaped metal bars are spaced across and the concrete thrown around them on to a centering. With floors a similar method is adopted. Here the steel bars are from 1in. to 2½in. deep and are suspended from steel stirrups that hang over the joists; 3½in., 4in. and 5in. heavy ribbed bars are put between main girders or resting on walls, and thus the use of ordinary steel joists is eliminated. In panelled floors all the joists and main girders are completely encased with concrete and the underside protected by slabs secured with concealed anchors, in spans up to 8ft., using 2in. and 2½in. ribbed bars hung in stirrups to carry from 4 cwt. to 12 cwt. The double form of construction is similar, except that the bars are laid on the lower flange of the joists and a wooden centering placed below to receive a 2½in. concrete ceiling. Columns are encased with not less than 2in. of concrete. Sewer pipes are also formed with steel ribs and concrete; the ribs are very light, and thus effect considerable saving in cartage, while the covering of them with concrete can be easily effected on the spot The firm prepares plans for the steel construction of their floors free of charge, and have just had completed their new constructional works at St. John's Wood, where the latest machinery has been installed. They have carried out a number of extensive contracts throughout the country, including some of the largest electric-power stations, warehouses, banks and other buildings.

Messrs. Merryweather & Sons, Ltd., of Greenwich Road, S.E., and 63, Long Acre, W.C., show the several kinds of steam fire-engines of which they are the well-known patentees and makers, including a motor engine, as adopted by the fire brigades of Brighton, Liverpool, Portsmouth, Plymout and other towns. Merryweather's pater "Kemik" fire engine carries 60 gallons powerful fire-extinguishing liquid, with hos and fittings for use from street hydrant The "Valiant" is a very useful portabl light engine for country mansions, weighin 11 cwt. and having a capacity of 200 gallor a minute; while another handy appliance the "Hatfield" pump for augmenting th pressure in the fire mains to protect the roo and top floors of high buildings, and als for water supply to country houses an hotels.

Mr. A. E. Brown, of Essex Wharf, White chapel, E., has a stall showing the "Frazzi system of fire-resisting floors, ceilings, parti tions, roofs and firebricks. In this syster hollow terra-cotta blocks are employed wit concrete over them; the exhibit shows a fla soffit with 4ft. centres providing for a safe loa of 3 cwt. per sq. ft., and a slightly curved soff with 3ft. centres providing for a safe load 6 cwt. per sq. ft. Of the materials used i this system Mr. Brown is the sole import into the British Isles, France, Belgiun Holland and the South African Colonies.

Passing now to the gallery in the Queen Court we find a large number of stalls.

Messrs. Homan & Rodgers, of 17, Grace church Street, E.C, have a stall built up wit steel stanchions and girders showing the co struction of their fire-resisting floors. Homan improved steeled concrete fireproof floor co sists of joists spaced at 4ft. 6in. centres, wit tension rods between, and the whole encase with concrete; the floor-boards being naile down on to wood fillets. This is claimed t be the cheapest form of fireproof constructio extant, and spans up to 30ft. can be forme without the use of main girders. Homan fireclay hollow-brick floor, as shown by th illustration on the next page, consists of triar gular-shaped fireclay bricks (grooved to affor a good key for the plaster below and th concrete above) fitted in between the joist (which are spaced at 1ft. 6in. centres) an finished with flooring in the usual manne Spans up to 24ft. may be executed withou main girders. The floor is very shallow, non-conductor of sound, requires no cente ing, and can be very cheaply constructe Some very fine photographs of work carrie out by this firm are exhibited on the stall.

The New Expanded Metal Co., Ltd., of Yor Street, Westminster, S.W., have erected building illustrating their system of constru tion. Expanded metal is the adaptation of a old amusement—"walking through a laure leaf," for the principle of forming a series cuts and then pulling out the material is th same in both. The building which forms th company's chief exhibit is enclosed wit expanded-steel fencing, and within thi enclosure are shown expanded-steel tre guards, builders' screens, window guard door mats, hat racks, clothes' locke and various other made-up goods of th company's manufacture; also a length expanded steel core for conduits, sewer work &c. Briefly, the building is about 31f long by 20ft. wide and 12ft. high to th eaves, with a couple roof. Many of th company's systems are shown in this exhibi A floor of 10ft. span is built 3ft. from th ground, so that the underside can be see and the method of temporary centerin thoroughly inspected. The walls are con structed on various systems, showing hollo and solid exterior and interior walls an partitions. A suspended ceiling is erect and the roof covered with slabs on a ne principle. In each system a portion of th expanded-steel framework is left uncovere so that not only the finished work appea but also the framework supporting it. A together the exhibit is worthy of caref inspection, as the methods employed can b adapted in so many ways.

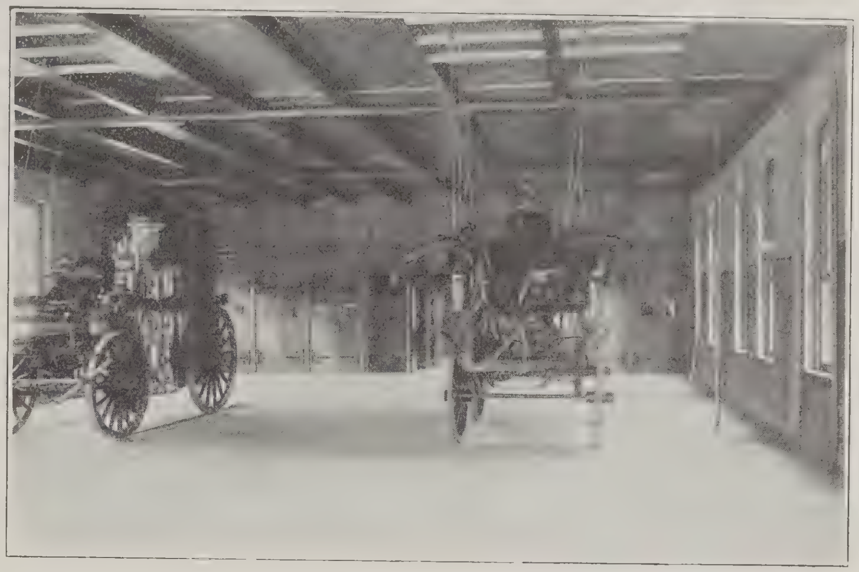
HOMAN'S FIREPROOF FLOOR.

The St. Pancras Ironwork Co., Ltd., of St. Pancras Road, London, N.W., have an attractive stall in the form of an iron stairs, from which one may examine the several photographs of work executed by this firm. With the growth of high buildings in which many persons live and work escape-staircases become a necessity, and in many important buildings these are being placed outside in positions where they are less likely to be attacked by the flames; they have, too, the advantage of being less liable to be rendered impassable by smoke, which may very possibly happen with staircases inside the building. A great number of these staircases have been erected by the St. Pancras Ironwork Co. in different parts of the kingdom; there is one, for example, on the western wall of Hyde Park Court, one of the highest buildings in London; and sixteen of them have been erected at Brook Hospital, Shooter's Hill. The firm also makes a speciality of modern stable fittings, with the stall divisions of iron; the mangers of iron or steel, enamelled inside; clean bright tiles on the walls, and the floor paved with special bricks laid to drain into iron gutters; so that everything is kept as sanitary and as fireproof as possible. Such stables as this have been carried out by the St. Pancras Ironwork Co. at Blenheim Palace, the British Embassy in Paris, and other important mansions; and it is interesting to note that the stable fittings, &c., for the fire station in the Western Gardens of the exhibition, already referred to, were selected by Lieut.-Col. Fox from this firm, who also supply safety concrete fireproof treads, iron doors for party walls, cellar-flaps, &c.



A TYPICAL AMERICAN FIRE-STATION.

The British Uralite Co., Ltd., of 50, Cannon Street, E.C., exhibit specimens of their material treated in different ways. Since its introduction into this country a few years ago Uralite has made great advances. At first, all the stock was obtained from Russia, but now the company has works of its own near Rochester, and are supplying large quantities of the material—250,000 sq. ft. of it have just been supplied to the Government for the new training college for naval cadets at Osborne. Uralite is composed of asbestos fibre cemented by silica. It is admirably fire-resisting, does not twist under heat, is unaffected to cold, damp, gases or acids, is about one-fifth the weight of iron, hardens by exposure, is vermin-proof and odourless. When used for outside work it is painted with a waterproof-paint. For roofs and walls it is particularly adapted, but the material may be employed for numerous other purposes—for instance, the encasing of safes, boilers or armoured doors; when used for armoured doors it is fixed on the wood and then sheeted with tinned steel sheets, and doors so formed have withstood over 2,300 degs. Fahr. without any marked effect beyond discoloration. Uralite is made in white, red and grey sheets, 5ft. 6in. by 3ft. and $\frac{7}{64}$in. thick, or cut as tiles to any size.

The Simplex Steel Conduit Co., Ltd., of 80, Digbeth, Birmingham, 20, Bucklersbury, London, and 1, Peel Street, Manchester, have a stall fitted with their patent conduit, showing its employment in electric wiring and the manner in which cut-outs, roses, and other fittings are attached. The tubes through which the wires pass are of enamelled and galvanized steel, and are much neater in appearance than the ordinary wood casings. They are screwed or socket-jointed and have boxes at various points for fittings. The system is altogether an up-to-date one. It is thoroughly insulated, occupies little space, and is particularly easy to inspect; repairs may be made with ease, as every part is get-at-able. All the fittings are subjected to a sand-blasting process before leaving the works, and the tubes have a smooth bore throughout, so that no abrasion of the wires can take place when erecting. In the show-cases and on the panels at the back of the stall are shown the more important of the fittings, such as bends, tees, junction, draw-in and branching boxes, also saddles, crampets and clips for erecting, together with plugs for fixing to the walls of a building. The whole stand is well lit at night time by about thirty lamps, which are controlled by one of the company's double-pole fuse and single-pole switchboards mounted in position. The accompanying illustration shows how the work is carried out.

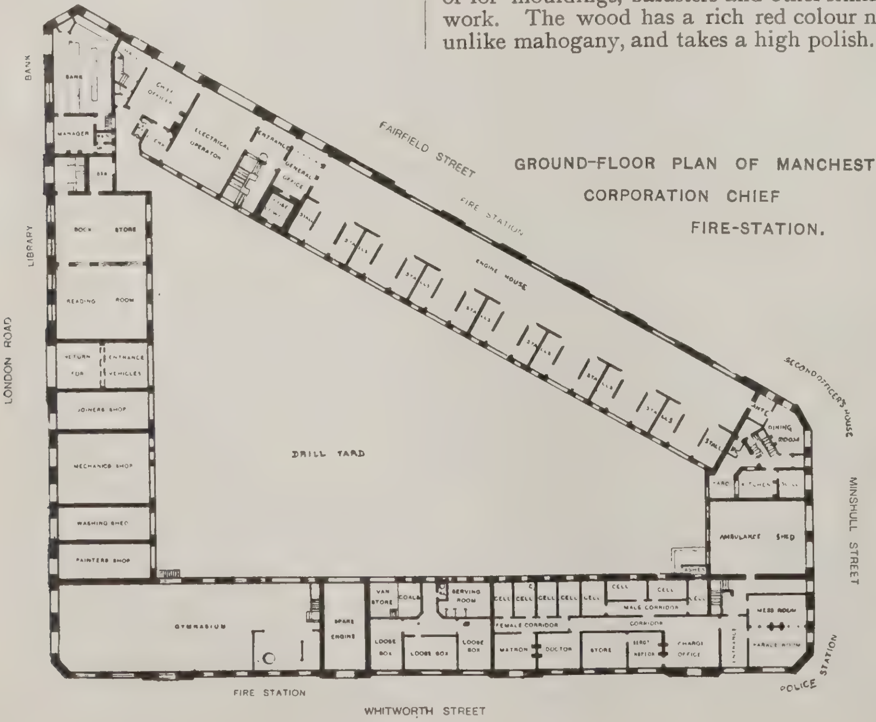
Messrs. Pilkington Brothers, Ltd., of 10, Upper Thames Street, E.C., exhibit specimens of their patent wired rolled glass; prismatic glass; polished, silvered polished, rough-cast, chequered rolled, and smoked-tinted plate glass; patent corrugated glass for iron roofs; pavement lights, &c. The wired rolled glass has wire netting embedded in it, and thus is held together under fire—it will, in fact, resist fire as long as the same thickness of iron would, while it cannot be broken by stone or other missiles. In 1899 an explosion occurred at a chemical works in St. Helen's, and though glass was shattered all over the town the roofs of Messrs. Greenall, Whitley's brewery and the Corporation Electricity Works, glazed with Pilkington's wired glass, were simply cracked, though glass in other parts of these buildings

was blown in and smashed to atoms. A particularly good feature about this glass is that, while being an efficient fire-stop, it enables any fire behind it to be seen, so that it proves of inestimable service to firemen in detecting where the fire exists. The patent prismatic rolled glass made by the firm diverts the light horizontally into the room and so illumines the parts furthest from the windows, instead of throwing the light where it is least required, that is, just below the windows. This glass can be had in sizes up to 5ft. high by 7ft. 6in. wide.

Mr. Howard R. Justice, M.I.M.E., of 55 and 56, Chancery Lane, W.C., exhibits Hayes's patent lathing. This is made of thin steel sheets stamped and punched out to form a key for the plaster, which can be used stiffer than on wood laths, and so dries sooner. Nails can be driven through without any danger of cracking the plaster. The sheets are of No. 28 gauge, measuring 72in. by 15in.; they are very light, 500 sheets weighing one ton. Hayes's patent reversible fire-resisting window is also exhibited. Frame and sashes are of galvanised iron, with wire glass and stamped chain: the window reverses for cleaning, and the sashes lock into the top and bottom when closed sharply. Some very supple steel wire scaffold ropes are also shown on the stall.

The General Electric Co., Ltd., of 71, Queen Victoria Street, E.C., have an elaborate stall embellished with beaten ironwork. The firm's patent telephonic fire-brigade alarm system is exhibited, and all kinds of switches, voltmeters, ammeters and other electrical apparatus. The Killingworth Hedges "air to earth" patent system of lightning conductors and fittings is also shown.

Millar's Karri and Jarrah Forests, Ltd., of 72, Bishopsgate Street Within, E.C., have constructed an imposing stall with their timbers, showing the construction of a fire-resisting floor. The wood has been carefully tested under fire and proved its good qualities. It can be used for heavy constructional parts or for mouldings, balusters and other similar work. The wood has a rich red colour not unlike mahogany, and takes a high polish.



GROUND-FLOOR PLAN OF MANCHESTER CORPORATION CHIEF FIRE-STATION.

Messrs. Drew-Bear, Perks & Co., Ltd., of 71A, Queen Victoria Street, E.C., exhibit some interesting models showing the steel construction of the stage at Covent Garden (illustrated in our issue for May 22nd, 1901) and of the auditorium of the King's Theatre at Hammersmith, as well as a number of photographs of other executed work. At Covent Garden the steel bridges are actuated by electric motors; they rise 9ft. above and descend 8ft. below the normal stage level. At the Hammersmith Theatre the dress circle and gallery are carried on large girders weighing upwards of 20 tons each, there being no columns. The ordinary stock of steel kept by the firm in London is capable of standing a tensile strain of 26 to 30 tons per sq. in., with an elongation of 20 per cent. in a length of 8in.; but special steel can be obtained to suit any particular requirements.

The Pearson Fire Alarm, Ltd., of 62, King William Street, E.C., show a board which has been made for their fire-alarm exchange at Birmingham. The system consists of thermostats installed wherever they may be desired in buildings and connected with the central station. By this means, when a thermostat becomes heated above 160 degs. Fahr. (or any other prearranged temperature) the electric circuit is closed and the signal given at the central station; so that means can immediately be taken to cope with the fire. This was the first automatic fire-alarm system in the Kingdom and the first to be licensed as a telegraph system by the Post Office. It is thoroughly reliable, and being worked on the "party-line" plan it enables each individual user to obtain the benefit of a central office or fire-department communication at the lowest possible rates.

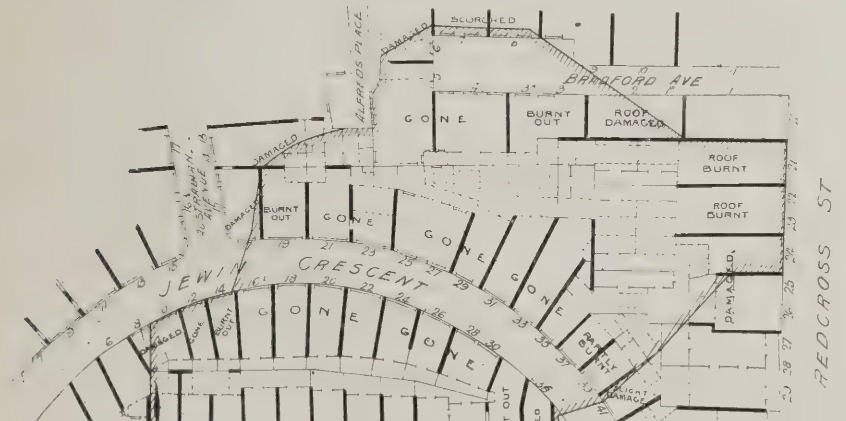
The Ratner Safe Co., Ltd., of 51, Moorgate Street, E.C. (works at Hancock Road, Bow, E.), exhibit all their varieties of safes. The patent twelve-corner-bent safes are formed out of one plate of steel, the back being riveted to the inner face of the back flange, while to the inner face of the front flange is riveted a strong bar door-frame against which the door closes; outside bands and joints, both sources of weakness against burglars, are thus avoided. To enable the safes to be bent out of the solid plate the firm has recently laid down most powerful machinery. The steel used is drill-proof, and the safes have chambers filled with an absorbent material mixed with a salt that gives off moisture under heat; chambers 4in. thick are used for the better-quality safes. Strong-room, party-wall and other doors are also made by the firm.

The Bergmann Electrical Works, of 11, Farringdon Avenue, E.C., show same cases of electrical fittings—switches and other accessories—together with some enclosed motors, ventilating fans and insulated steel conduit for electric wiring; the last can be bent cold with a special tool to almost any form desired.

Mr. Rud. A. Stoffert, 121, Bath Street, Glasgow, has an exhibit of his patent "Fram" fireproof floors and partitions, which are also manufactured by the sub-licensees—The "Fram" Fireproof Flooring Company, Manchester; Mr. Oliver C. Townsend, New Bilton, Rugby; and Messrs. G. Aston & Son, Eagle Wharf Road, London, N. The floors are formed of steel joists with arch blocks between, and can be used at once, the soffit being left open or covered by plaster boards, or finished in any other way. Wooden flooring can be nailed on to the blocks, which can also be sawn without crumbling.

Messrs. J. H. Heathman & Co., of 72, Rectory Road, Parson's Green, S.W., exhibit a very large number of fire escapes and ladders of all sorts. The firm's patent telescopic ladder tower is made in various sizes, with platforms rising to 55ft.; the gearing is simple and efficient, and the wooden framework well braced. The sliding sections can be locked at any height, and when fully extended are quite rigid. They are mounted on wheels and close down to a small compass. These ladders have been supplied to the Russian Palace at Novorossisk, to the Manchester, Liverpool and Aberdeen railway stations, the India Office, Drury Lane Theatre, Brompton Oratory, and numerous hospitals, art galleries and hotels throughout the country.

EDINBURGH CHIEF FIRE-STATION.



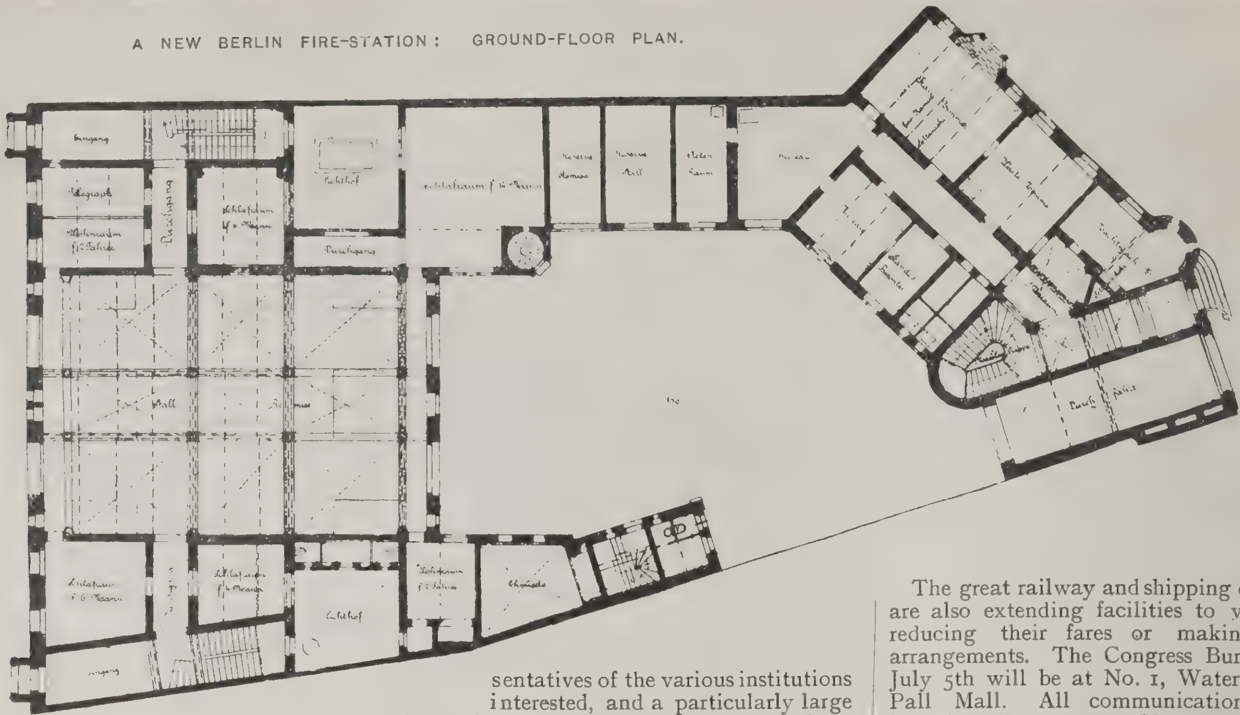
THE CRIPPLEGATE FIRE, NOVEMBER 19TH, 1897.
FROM AN INSURANCE PLAN OF LONDON BY CHARLES E. GOAD.

Among other exhibitors in this gallery of the Queen's Court are the following:—The Patent Impervious Stone Co., of Rutland Wharf, Hammersmith, who show two stone stairs; the Eavis Fireproof Materials Co., of Manor Works, Stamford Terrace, Stoke Newington, N., makers of fireproof interlocking wall-plates with helical vertical channels for cement grouting, fibrous and other plaster slabs, "Asbestolite" sheets, &c.; Mr. William Miller, of 212, St. Vincent Street, Glasgow, and other firms, who show the patent chemical fire extinguishers of which they are the patentees and makers; Mr. Jabez Thompson, of Northwich, who exhibits his patent "Brickwood" blocks, fireproof, soundproof and only half the weight of ordinary bricks; the Shepwood Co., of Lindisfarne, Walton-on-Thames, who show specimens of their patent "Shepwood" partition bricks with cavities running vertically through them (a partition finishing 2½in. thick being as rigid as an ordinary 4½in. wall); Messrs. Gourmet & Co., of Mount Pleasant, London, W.C., who show the "Sootene" fire extinguisher, a dry powder which robs the air of its oxygen, especially suited for oil and similar fires, where water is worse than useless; and Messrs. P. Hensel & Co., of 12, Long Lane, E.C., who show their "National" fire-alarm system and thermostatic temperature-controlling apparatus for industrial and other purposes.

The main hall of the Queen's Court is almost exclusively devoted to German exhibits. We have already noticed those of the Berlin and other official authorities; but in addition there are also many trade exhibits. The "Terrast" Baugesellschaft, m.b.H., of Karlsbad, Berlin, W. 15 (London agent, Mr. Frederick Rings, architect and surveyor, 42, St. Filland's Road, Catford), exhibit their system of flooring, consisting of wire netting spread sagged over the joists and filled in with concrete, and also an imitation of marble called "Terramor." The "Terrace" system of building hospitals, sanatoria, &c., is shown by some models, the several floors being formed one below the other in steps with promenades for patients. Examples of concrete work are exhibited by various other firms, fire-extinguishers, hydrants, the Schapler-Fries pneumatic tower escape which can be extended 83ft. in forty seconds, and a material called "Lapidon" in close imitation of wood.

On July 6th the International Fire Prevention Congress will be opened at Earl's

A NEW BERLIN FIRE-STATION: GROUND-FLOOR PLAN.

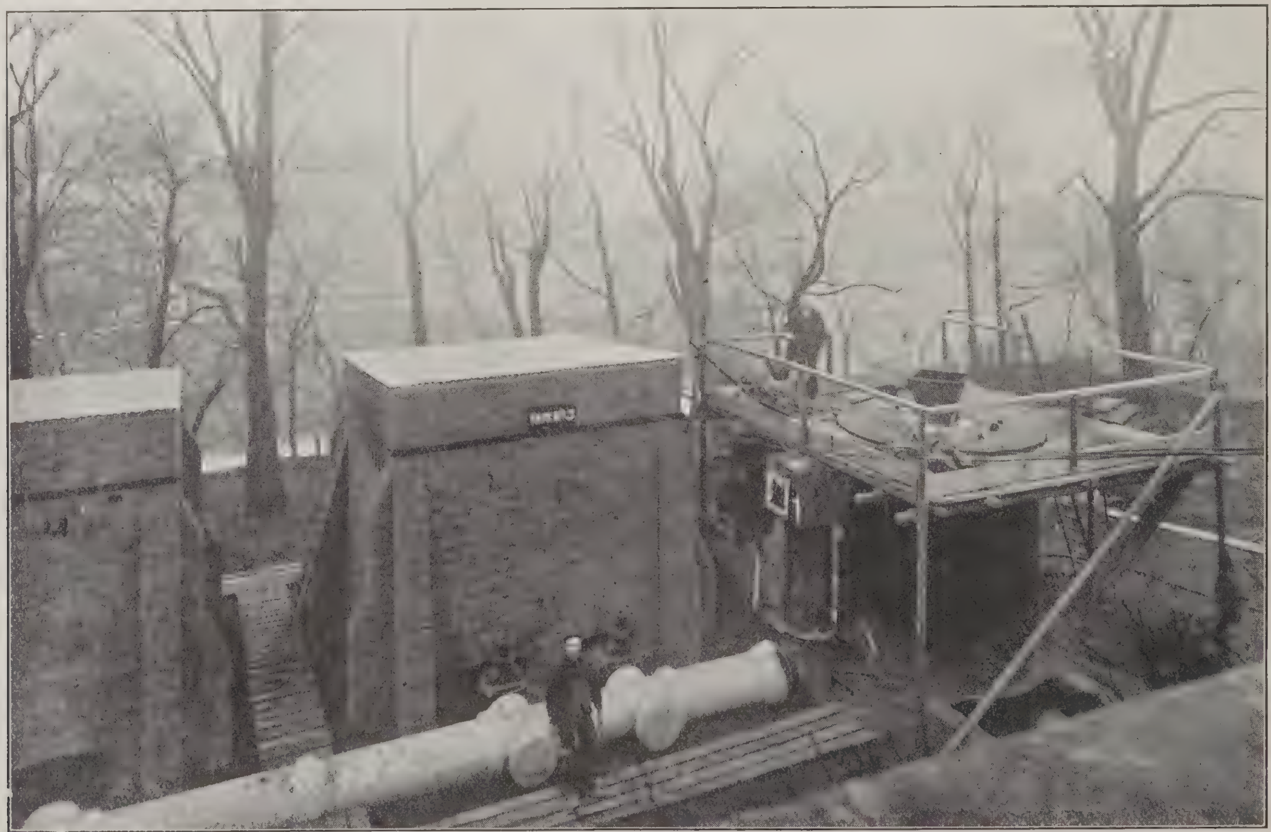


Court, and from July 9th to 18th the National Fire-Brigades' Union will hold a series of competitions in the grounds.

The Congress will be attended by six special delegates from our leading Government departments, also by six representatives of the City of London, three from the Metropolitan Asylums Board, four from the London Chamber of Commerce, and quite a number from the other local authorities and institutions. Nearly all the leading provincial municipalities—numbering over eighty—have also decided to be officially represented on this occasion, and the German, French, Italian, Hungarian, Belgian and other Continental Governments have intimated their intention of sending delegates, as have also a number of leading foreign municipalities. Australia, Canada and India will send representatives of the various institutions interested, and a particularly large deputation of engineers is coming over from the United States. The Congress being essentially a technical one dealing with the "prevention" of fire by better construction and equipment by legislation and other precautionary measures, the membership comprises mainly public officials, architects, engineers and fire-brigade officers, but the insurance interests will also be represented, as also the universities and other teaching bodies. Special courtesies have been accorded to members of the Congress during their stay in London, inasmuch as the Duke of Sutherland, the Duke of Wellington and others have thrown open their private galleries; whilst the Speaker of the House of Commons, the Master of the Mint, the Secretary of the General Post-Office and other public officials are according various facilities

The great railway and shipping companies are also extending facilities to visitors by reducing their fares or making special arrangements. The Congress Bureau up to July 5th will be at No. 1, Waterloo Place, Pall Mall. All communications should be addressed to the general hon. secretary of the British Fire Prevention Committee, and not to individuals or sectional hon. secretaries.

In regard to the London Fire Service, it is noteworthy that for some considerable time past the men under instruction at Southwark Bridge Road, the headquarters of the brigade, have been engaged in perfecting themselves in a new "hook and ladder" drill, which is quite unique as far as the present system of the force is concerned. The men are being trained to ascend lofty buildings by means of hook ladders used in conjunction with the ordinary long ladders, and the new methods present important possibilities in the work of rescue from burning buildings. The hooked ladders are termed "emergency ladders," and are now carried on every horsed escape in London.



TESTING HUTS OF THE BRITISH FIRE PREVENTION COMMITTEE AT WESTBOURNE PARK, LONDON, W.

Builders' Notes.

Mr. Henry R. Rons, builder, of Grays, died recently.

The Dispute in the Tyne District between the house-building employers and joiners has been settled. The employers have withdrawn their notice for 1d. per hour reduction in wages and alteration in rules.

A Building Trade Walking Match.—A walk from Horsham to Henfield and back, a distance of twenty-three miles, by competitors exclusively engaged in the Horsham building trade as masters, surveyors, managers, foremen, clerks or mechanics, took place on Whit Monday, a start being made from the Carfax. The winner was Mr. J. Garman.

The death is announced of Mr. Thomas Heap, a prominent Blackpool builder. He was seventy years of age. Mr. Heap, who was born at Bradford, went to Blackpool about seventeen or eighteen years ago. He had undertaken many big works in connection with the development of streets and the building of property. He was also an agent for all kinds of building materials.

Presentation to a Masonry Instructor.—The members of the masons' class at the Battersea Polytechnic recently presented an illuminated address to Mr. John Wornell (who is now retiring) as a token of their gratitude and appreciation of his kindness and generosity to them during the six years he has performed the task of teaching practical masonry. The principal, Mr. Sidney H. Wells, made the presentation.

Building Operations in Nottingham have increased largely during the past four years. In the year ending March 31st, 1900, the number of plans for new buildings passed was 1,768. During the twelve months just ended the number was 2,775—over a thousand more in the year and 1,377 more than in 1901. Building sites have been snapped up on every hand, and on the edge of the city houses have also sprung up rapidly in some districts.

Messrs. Morrison, Ingram & Co., Ltd., of Manchester, have supplied the whole of the lavatories at the New Midland Hotel, Manchester. They also supplied a considerable quantity of the cast-iron conduits for the electrical work in the corridors. The lavatories mark a new departure in good hotel lavatory work. Hitherto it has been the custom to fix marble top lavatories, involving troublesome fixing and massive effect. In the visitors' lavatories in the Midland Hotel an attempt has been made to obtain a light and graceful appearance with ample strength and the maximum of sanitary efficiency, together with simplicity in the fittings and easy accessibility. The style is Louis XV., and the basins are tinted porcelain, with white metal fittings. In ranges, space is afforded between each basin for cleansing. The supply and vent pipes are in copper, nickel-plated, while the supporting frieze is in mahogany Chippendale polished, with metal legs to match.

The Building Trade in Johannesburg seems to be in a prosperous state. Amongst the many new business buildings either projected or in course of construction are:—The Bank of Natal, cost £30,000; Harvey, Greenacre, Rissik Street, between Market Square and Pritchard Street, cost £40,000; Walter Block, Eloff Street, between Bree and Jeppe Streets, cost £40,000; and the new theatre, nearly opposite the Walter Block, cost £65,000 to £70,000. Messrs. McIntosh & Moffat are the architects for all of the above. The home of the New Catholic Club, at the corner of Nugget and Jeppe Streets, is now in course of construction, and work upon it has been proceeding rapidly. The building is described as of the Classic Romanesque style of architecture, and three storeys high, of cement and brick. The estimated cost is £15,000, and Mr. J. F. Beardwood is the architect, who also designed the Catholic Club in Pretoria. A Y.M.C.A. building is to be erected at the corner of Bree and Joubert Streets, at a cost of about £40,000. Messrs. Leek & Emily are the architects. The Johannesburg Town Council has adopted the waterborne system of sewage. A beginning is to be made with the northern part of the town. It has also been decided to introduce a storm-water drainage, which will effect a great saving in preventing the destruction of roads.

Labour Troubles in New York.—Building operations all over New York are nearly at a standstill owing to the labour conflict. The trouble has assumed large proportions At the beginning of May it was hoped that by common agreement disputes would be avoided, allowing the building boom, which has lasted now for three or four years, to work itself out in a natural way. Demands for an increase of wages were willingly conceded in many branches of the building trades, and the scale of pay all round is higher than it has ever been. But regardless of the signs that the period of extreme prosperity is reaching its limit, the trade unions have sought to impose upon the contractors and master-builders harassing sets of union rules. The builders organized themselves into a general federation to protect their rights and interests. The idea took a national form, and as the outcome of a great meeting of employers a National Federation of Employers will probably be formed as a counterpoise to the American Federation of Labour, which claims to control 2,000,000 working men. From every city and town of importance east of the Mississippi have come applications for admission to the federation and offers of support. The promoters declare that they are not fighting the unions as unions, nor is it a question of wages or hours of labour. It is rather a question of industrial independence. On his return to town one big contractor with many sky-scrapers and tenement houses of the better kind on his hands was confronted by a set of new demands from the plasterers' union. Not only did the plasterers ask for their daily wage to be raised from 3¼ dollars to 4 dollars (13s. to 16s.), but they also insisted that the employers should furnish them with the implements of their work, and that all the plaster and mortar should be union made. Similarly the stone cutters want all helpers and drivers to be union men; the painters require all employees of the shops where their materials come from to be members of a union; while the architectural iron workers threaten to refuse to handle material not delivered by union men. Some idea of the fairness of the wages paid to the workers may be gathered from the fact that even the Italian "rockmen and excavators," who to the number of 4,500 have struck on the subway railroad, admit that they have made enough money to stay out six months if necessary—and this though rents have gone up, cabbages have risen from 3 to 10 cents (5d.) and a pint of beer costs a man 15 cents (7½d.). However, though these strikers defiantly rejected the counsel of their own leader and the Central Federated Union, with which they were affiliated, to accept the proposition for arbitration of the chief contractor of the subway, Mr John B. McDonald, the influx of independent labour has been too strong for them. Every week sees thousands of immigrants, and work on the subway is being continued with little fear of its being prolonged beyond contract time. So much violence was threatened by these compact bodies of Italian labourers that, for the first time in several years, every man in the police force was ordered to hold himself in readiness to turn out on an emergency. The back of this particular strike is broken. Meanwhile the originators of the building trades' strike, the teamsters, have returned to work owing to common concessions. There were about four thousand of these men, and their stoppage made idle a hundred thousand engaged in building.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver.]

During the week ending June 6th six failures in the building and timber trades in England and Wales were gazetted.

H. C. Nunn, builder, Cherryhinton. P.E., Cambridge Guildhall, June 17th, at 11.

F. A. Chatfield, builder, Stapleford. P.E., Derby C.C., June 16th, at 11.

W. Parkinson, builder, Southend-on-Sea. P.E., Chelmsford Shirehall, July 1st, at 10.

G. R. Smith, builder and joinery manufacturer, Abertillery. P.E., Tredegar C.C., July 10th, at 10 30.

G. Versey, sanitary engineer, South Lowestoft. R.O. May 28th.

G. H. Stoker, joiner and builder, Calton. R.O. May 25th. P.E., York Courts of Justice, July 3rd, at 11.

O. G. Pritchard, joiner and contractor, Liscard. First meeting, O.R.'s, Liverpool, June 17th, at 12. P.E., Birkenhead C.C., August 19th, at 11.

C. H. Jacobsen, builder, Enfield. First meeting, 8, Temple Chambers, E.C., June 10th, at 12. P.E., Edmonton C.C., June 22nd, at 11.30.

E. H. Williams, builder, Aberystwyth. First meeting, Town Hall, Aberystwyth, June 16th, at 11. P.E., Aberystwyth Town Hall, June 16th, at 10.30.

J. W. Groves, builder, Sutton Scotney. First meeting, O.R.'s, Southampton, June 10th, at 3. P.E., Winchester Castle, June 15th. at 11.

Trade and Craft.

Ventilators.

The catalogue issued by Messrs. F. W. Barker & Co., of 12, Earl Street, Westminster, shows a large number of ventilators, extracting cowls, air-bricks, gratings, regulating valves for flues, &c. The firm's patent automatic ventilator consists of a central shaft surrounded by four extracting chambers (each having an exhaust opening from top to bottom) and facing four curved outer plates which form the outside of the ventilator. As the extracting outlets are shut off from one another the action of each is entirely independent and cannot be neutralized by air entering from another opening; so that there are really four ventilators in one. The cap is formed to entirely keep out rain or snow, and the base is made from one piece of metal, thus being very rigid. These ventilators have been used all over the Kingdom.

THE LONDON
OF OUR
FORE-FATHERS

is rapidly disappearing, and many picturesque bits of Old London have already been demolished to make room for modern requirements.

The following Photogravures (reproduced by the Rembrandt Process), from originals by Mr. F. L. Emanuel, form a lasting record of many of these interesting buildings.

No further copies can be published, as the plates have been destroyed, and the pictures are therefore quite unique.

Single Copies at the following Prices:—

1. The "Old Horse and Groom," Back of Holborn-above-Bar (since demolished).	6d. each.
2. Holywell Street, from St. Clement Dane's Church (since demolished).	2s. 6d. each.
3. The "Old Bell," Holborn (since demolished).	1s. 6d. each.
4. Leather Lane, Holborn.	1s. 0d. each.
5. Davies Street (since demolished).	9d. each.
6. Fetter Lane, View from Holborn.	6d. each.
7. King Street, Westminster (since demolished).	1s. 6d. each.
8. Staple Inn, Holborn.	2s. 6d. each.
9. Milford Lane, Strand, and Booksellers' Row, looking West (since demolished).	6d. each
10. Lincoln's Inn Fields.	1s. 6d. each.
11. Archway, Portugal Street, Lincoln's Inn Fields.	9d. each.

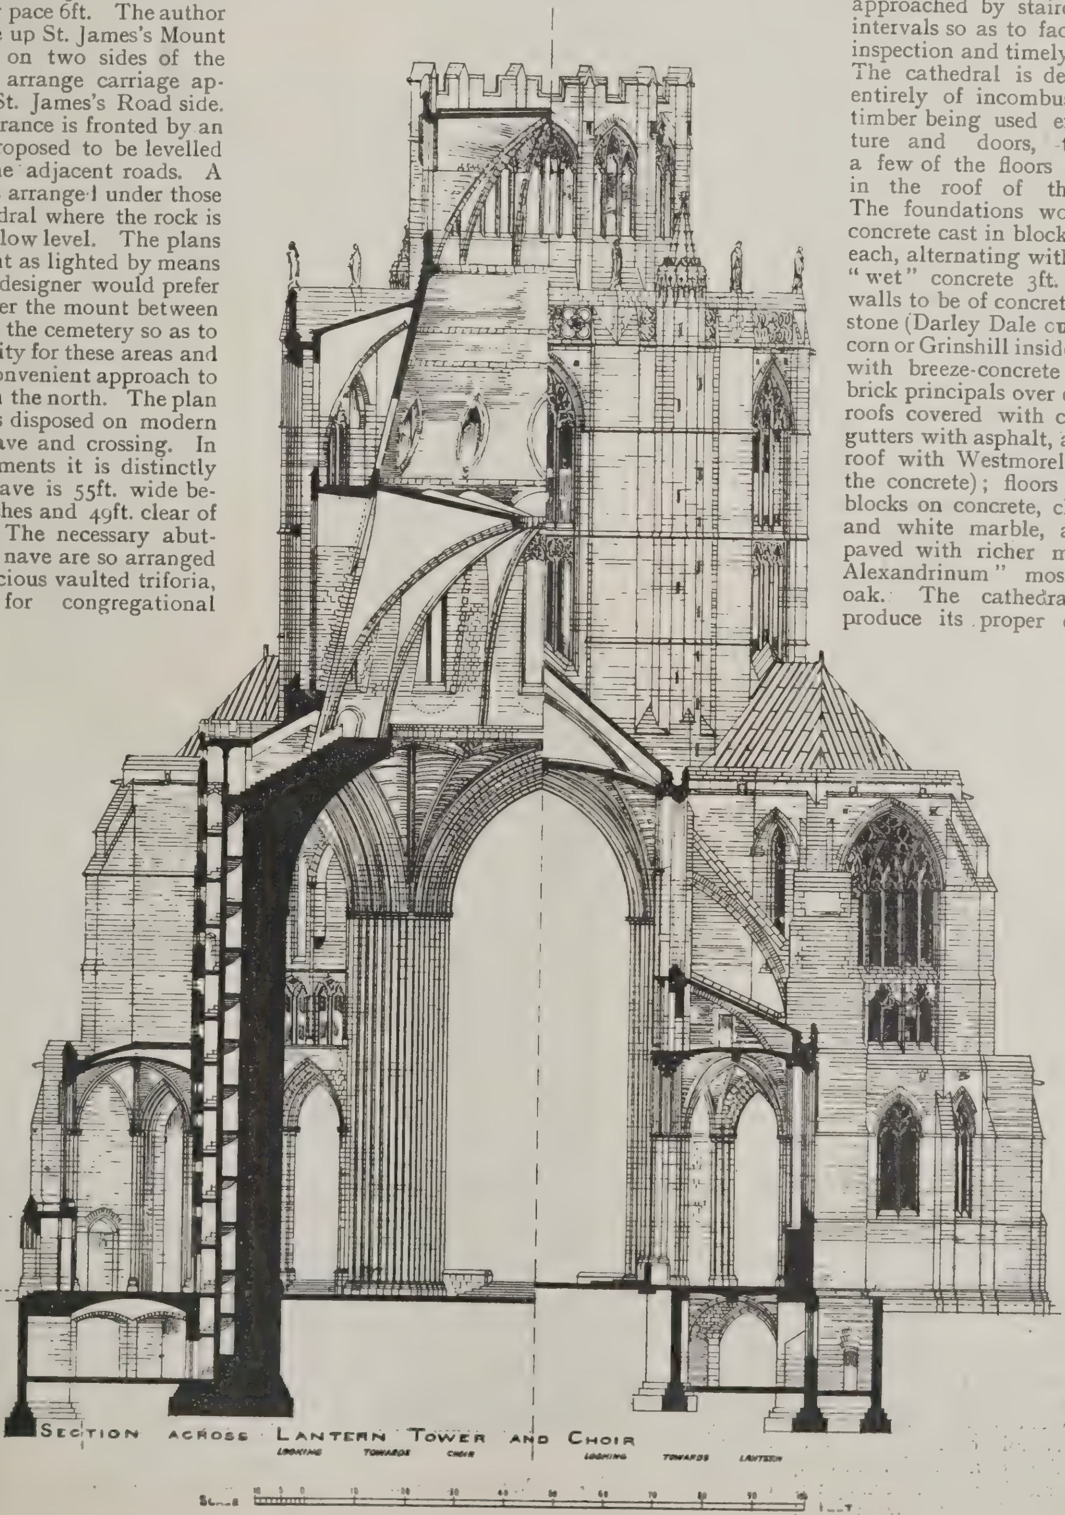
LIVERPOOL CATHEDRAL.

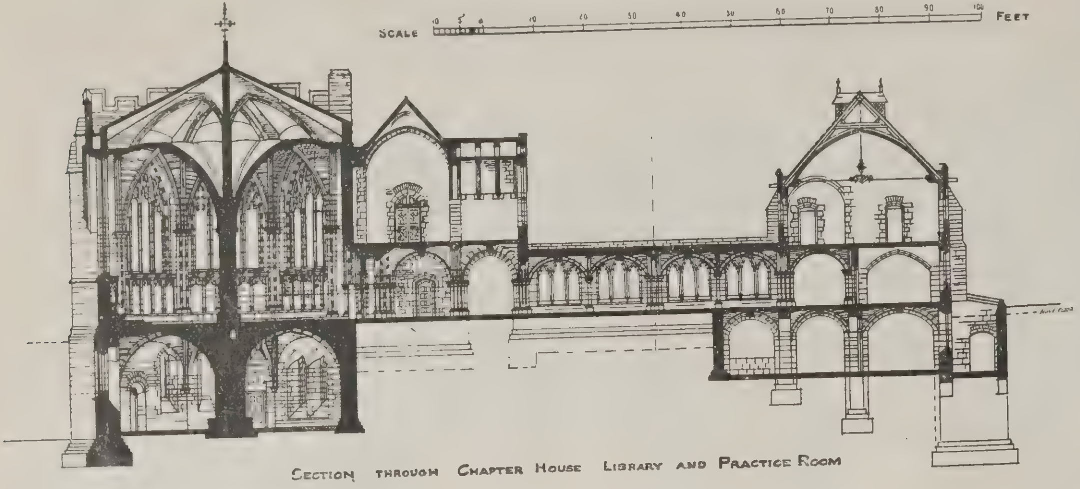
Some Details of Mr. Nicholson's Design.

IN the design for Liverpool Cathedral submitted by Mr. C. A. Nicholson, and illustrated in this issue, the axis of the building lies north and south: the choir and morning chapel are at the south end, the axis of the latter being east and west. The level of the nave floor has been fixed at 150ft. above Ordnance datum. The choir and chapel floors are 3ft. above this line and the altar pace 6ft. The author proposed to make up St. James's Mount to form terraces on two sides of the cathedral and to arrange carriage approaches on the St. James's Road side. The principal entrance is fronted by an open "square" proposed to be levelled to the lines of the adjacent roads. A basement storey is arranged under those parts of the cathedral where the rock is not found until a low level. The plans show this basement as lighted by means of areas, but the designer would prefer if possible to lower the mount between the cathedral and the cemetery so as to obviate the necessity for these areas and to afford a more convenient approach to the basement from the north. The plan of the cathedral is disposed on modern lines with wide nave and crossing. In liturgical arrangements it is distinctly Anglican. The nave is 55ft. wide between the pier arches and 49ft. clear of vaulting shafts. The necessary abutments of so wide a nave are so arranged as to provide spacious vaulted triforia, capable of use for congregational purposes on special occasions. The nave aisles are comparatively narrow, as their principal purpose is to serve as passages, to afford room for monuments, and to give an effect of spaciousness to the interior of the church. The nave is vaulted with a Welsh groin in order to avoid loss of space under the external roof. The aisles have plain quadripartite vaults, and the triforium is ceiled with transverse barrel-vaults between the buttress arches. The crossing is hexagonal on plan, and is described about a circle of 90ft. diameter. The choir and transepts are each 45ft. between arches, the transepts being semi-hexagonal on plan and surrounded with passage aisles and recessed bays between their buttresses. The crossing has groined pendentives ranging with the main vaults, above which it is carried up as a dodecagonal tower finished with a small lantern carried upon a cone. The internal groining of the crossing is 156ft. from the nave floor, but a small eye is left in this vault showing the upper lantern from the floor of the church.

The crossing being the space which would generally be used for congregational purposes, special attention was given to its acoustics: the vault is kept comparatively low and the preacher is placed on the long side of the space. The choir is four bays in length and lighted by clearstory windows. The morning chapel forms a quasi-transept after the fashion of the "nine altars" at Durham, in order that the surroundings of the principal altar might not appear either gloomy or restricted. Passages are provided around the whole cathedral at the triforium and clearstory levels. These and the gutters are approached by staircases at convenient intervals so as to facilitate the constant inspection and timely repair of the fabric. The cathedral is designed to be built entirely of incombustible materials, no timber being used except in the furniture and doors, the bell framing, a few of the floors in the towers, and in the roof of the practice room. The foundations would be of cement-concrete cast in blocks of about two tons each, alternating with bands of ordinary "wet" concrete 3ft. or 4ft. high. The walls to be of concrete blocks faced with stone (Darley Dale outside and red Runcorn or Grinshill inside); the roofs formed with breeze-concrete arches carried on brick principals over each pier (principal roofs covered with cast lead, flats and gutters with asphalt, and the vestry block roof with Westmoreland slates nailed to the concrete); floors generally of teak blocks on concrete, choir floor of black and white marble, and the sanctuary paved with richer marbles and "opus Alexandrinum" mosaic; furniture of oak. The cathedral is designed to produce its proper effect without the aid of sculpture or painting, though both might advantageously be employed. Heating by low-pressure hot water and lighting by electricity in such places only as may be necessary for the convenience of worshippers, as it was the particular aim of the architect to give a mystery to the interior, which would be quite impossible with a multitude of lights placed in the ordinary way all over the building. The main elevation and longitudinal section are given in our centre plates this week, the other elevations, sections, details and plan of the building being reproduced among the text.



DESIGN FOR LIVERPOOL CATHEDRAL BY C. A. NICHOLSON.



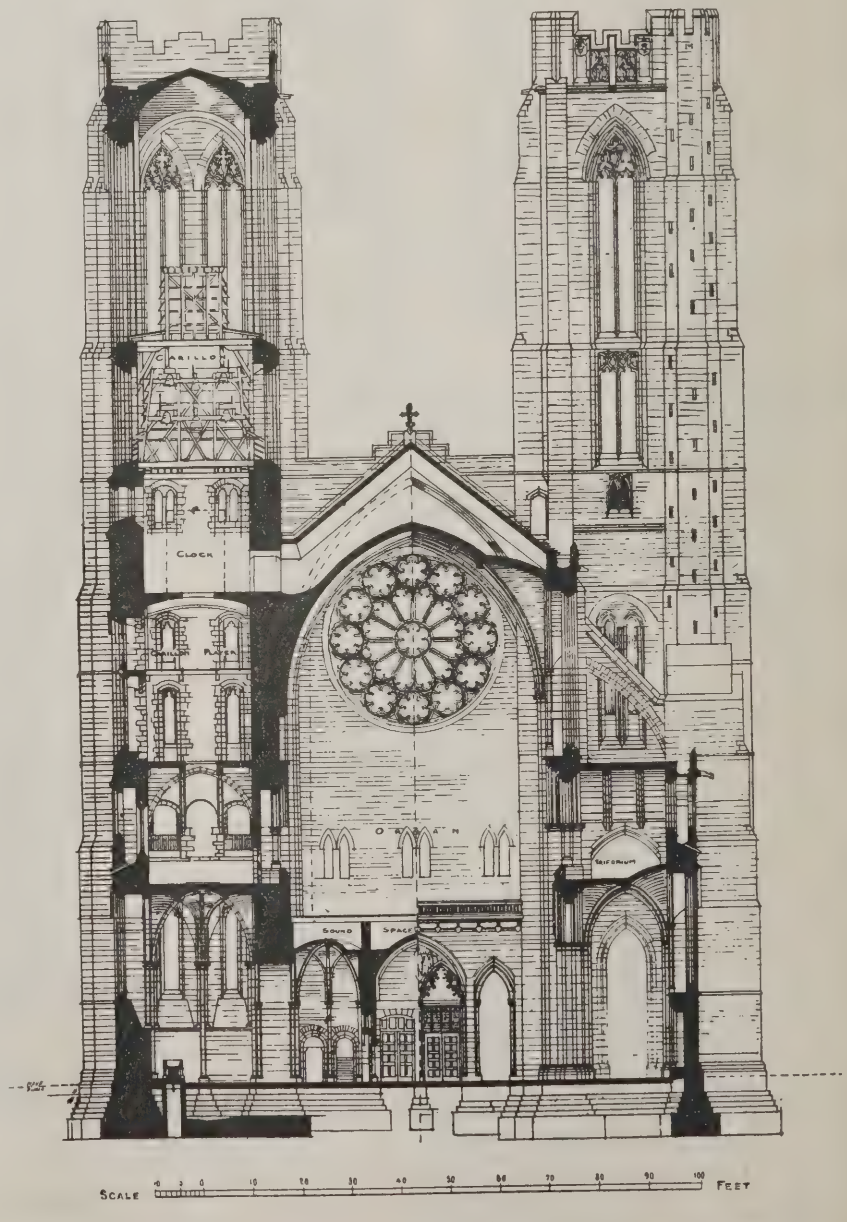
DESIGN FOR LIVERPOOL CATHEDRAL BY C. A. NICHOLSON.

NEW ARCHAEOLOGICAL DISCOVERIES.

ANNOUNCEMENTS are made of fresh archæological discoveries in three different quarters, namely, at Beni Hasan, Nippur and Knossos. At **Beni Hasan** excavations have been made during the past season in the hill-side, a site already famous for its painted tombs and early architectural features. Below the gallery along which these lie there has now been found an extensive necropolis. Though the rock-hewn tombs for which the site has become known are themselves of the XIth and XIIth Dynasties, it has been supposed that the district was already of importance at an earlier period, dating possibly as far back as the Old Empire. It is now seen that a gallery of smaller rock tombs, at a lower level, was hewn probably in the VIth Dynasty. These tombs are eight or ten in number, two of them being inscribed in the style and with the names characteristic of the period: one of them is also decorated in bas-relief and with paintings. The other tombs were all of the early Middle Empire—the XIth and early XIIth Dynasties. Four hundred and ninety-two of them were opened and examined. These, too, were hewn in the rock, but were of the more familiar character known as pit-tombs. More than 100 of them had never been previously entered, and their doors were now opened for the first time since they had been closed 4,000 years ago. In one tomb were several wooden models of objects and scenes familiar from the wall-paintings of the larger tombs—a great rowing-boat, a model of a granary, and representations of men engaged in various occupations. Musical instruments and objects of other significance were also found in the tombs, an object of special architectural interest being a wooden capital in the form of a lily. The objects, it is pleasing to know, will enrich the museums of our Universities—Oxford, Cambridge and Liverpool being represented among the patrons—as well as some of the best known private collections of Egyptian antiquities in England. Previous to distribution it is hoped to hold an exhibition of them at Burlington House during next month.

The Excavations at Nippur under the direction of Professor Hilprecht have also been very fruitful.

Already sufficient work has been done upon the great Temple of Bel to show that previous conceptions of a Babylonian temple will have to be modified considerably; and important light has been thrown upon the different periods of building—from pre-Sargonic times to early Arabic days—represented in the Nippur mounds. One of the most interesting structures, and one which has been most thoroughly excavated, is a small Parthian palace, which lay on the south-west side of the Shatt en-Nil, the old canal which divided the ancient city into two nearly equal portions. Doctor Peters, the director of the first two excavations, partly cleared this building; and Mr. Haynes, his successor, made a more thorough examination of it; but it remained for Hilprecht to complete the work and determine the age and other particulars of the structure. Peters believed that the building was erected somewhere between 1450 and 1250 B.C. Hilprecht has shown conclusively that it was built a thousand years later. Roughly speaking, the palace is square on plan, each side being about 170ft. long. In its construction large (12in. by 12in. by $7\frac{1}{2}$in.) unbaked bricks were mostly used, but in some portions baked bricks had a place. The walls varied in thickness from 3ft. in the partition walls to 8ft. 6in. in the exterior ones. Externally the building was remarkably plain; the surfaces of three of the walls were broken by shallow buttresses, but the fourth, which faced the canal, was quite bare. There was only one entrance, placed nearly in the centre of the north-west façade. This doorway showed evidence of considerable skill and some taste on the part of its builders. It was constructed in baked brick and stuccoed with white plaster. On either side stood a pedestal, rising from an



DESIGN FOR LIVERPOOL CATHEDRAL BY C. A. NICHOLSON: SECTION ACROSS BAPTISTERY AND NAVE.

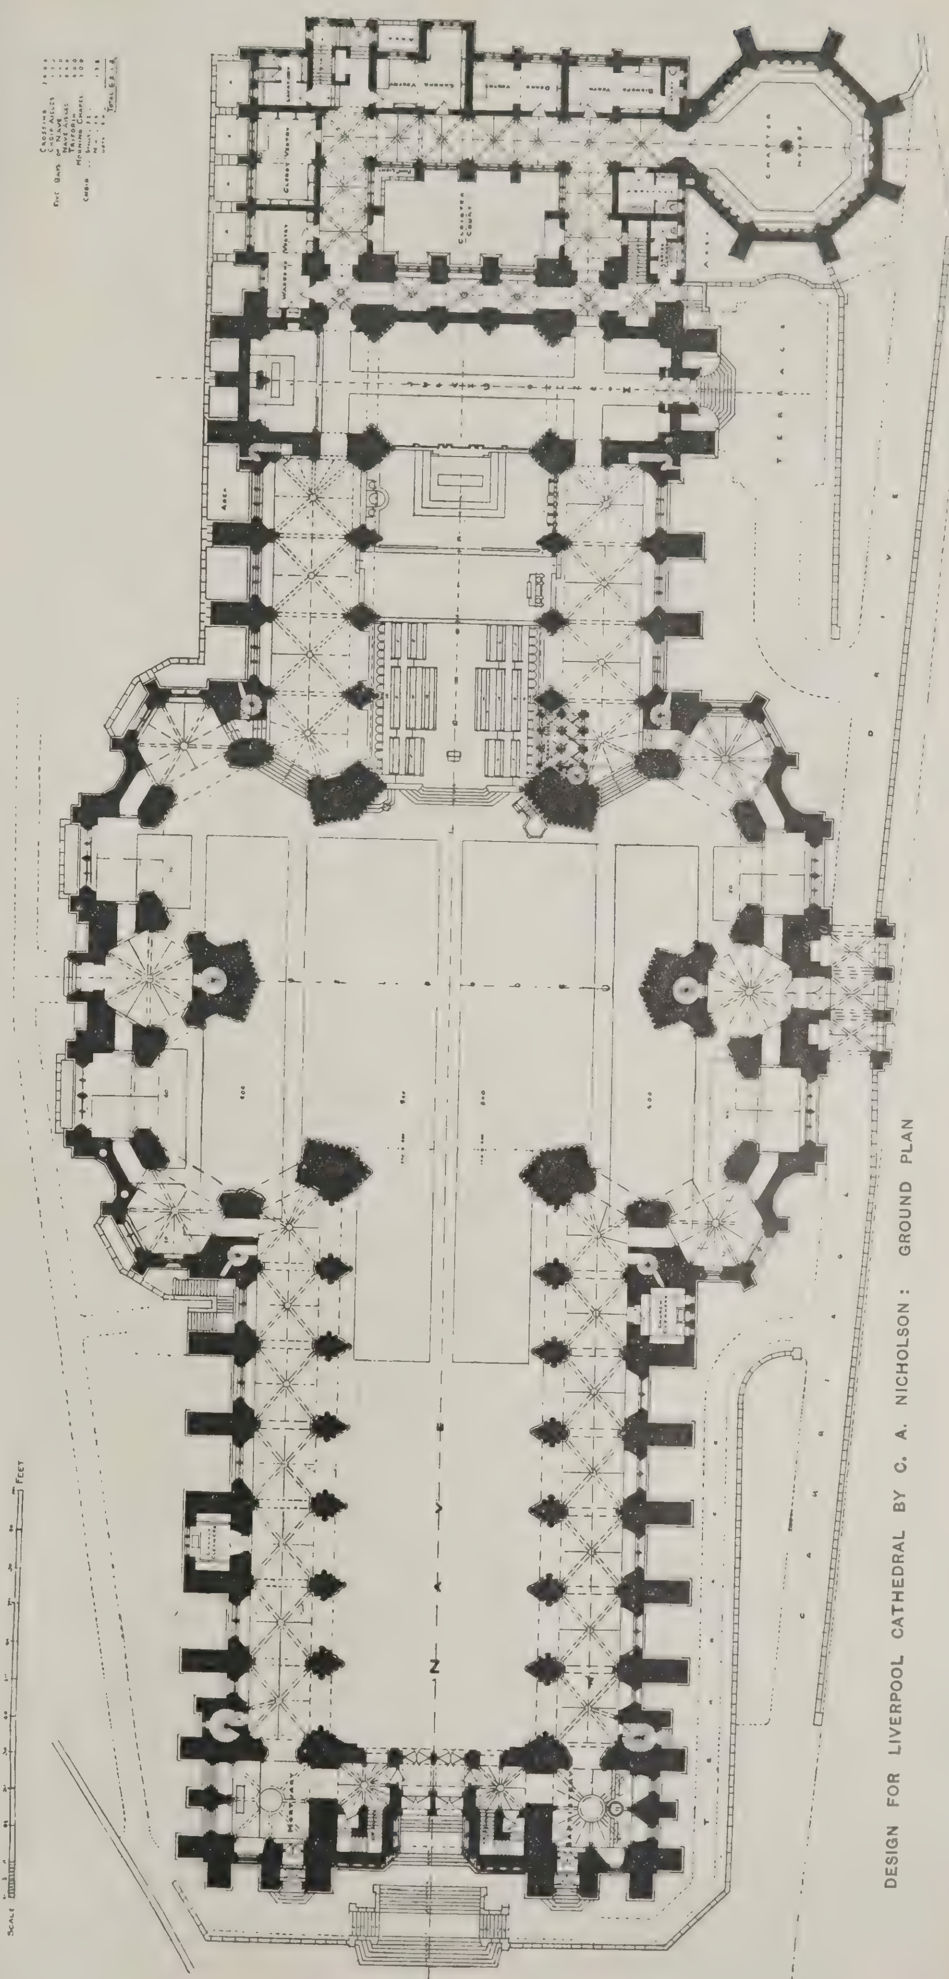
ornamental base and decorated with small pediments. The junction of the crude brick with the baked was concealed by plaster mouldings, and faint traces of fluting were visible on the pedestal. Internally the building was divided into two parts, one of which served for the men's quarters and public apartments, the other for the servants' quarters and the domestic portion of the household—corresponding to the harem buildings of the present day. By an ingenious arrangement of lobbies and narrow passages, the "harem" apartments and servants' rooms were completely cut off from the rest of the building. They comprised a kitchen, several store chambers, a bathroom—which was provided with a bitumen-covered pavement sloping towards a drain in its centre—and sleeping apartments, in which were raised platforms (or beds) of brickwork. The most ambitious feature of the plan was an open court with a colonnade, which was reached from the entrance through a couple of anterooms. From this court a number of small ooms open off, and opposite the portico are he two largest apartments in the palace. A smaller court stood between the servants' uarters and the superior rooms of the harem." In both these courts were columns f burned brick, stuccoed with fine plaster. n the principal one were four circular olumns on each side, with a square one at ach angle, all built up with a foundation of urned brick, while the court itself was paved vith crude brick. The columns were plainly Babylonian imitations of Doric columns," nd, in fact, the characteristics of the building throughout are, as Professor Hilprecht oints out, entirely un-Babylonian and much ore like the features "of the ancient Greek ouses on Delos." The balanced plan, the eatment of the entrance, the columns themlves, are all plain evidence of the correctess of Hilprecht's dating of the building. view of their very limited choice of aterial, the builders may be pardoned for sing stucco; and the ingenuity they dislayed in constructing the tapering columns ith specially moulded bricks and in buildg up the capitals with two distinct patrns of mouldings is far ahead of the work the earlier builders at Nippur.

At many widely separated points of the te interesting buildings were discovered, cluding the now famous "Library," but is impossible to give a description of l of them, owing to lack of space. Suffice to say that in the upper strata of the ound was a huge fortified building, conctured to have been the palace of a prince governor, the rooms in one part being nstructed with double walls for the sake coolness. The citadel was an immense atform, cruciform on plan, which rose out 30ft. above the surrounding buildings the fortress and had still a second stage, t lower than 20ft., rising from its centre. deed, this fortified palace must have been ll-nigh impregnable; for all the buildgs were enclosed by yet another strong ll, which, when excavated, rose to a ight of over 60ft., was more than 30ft. ck at its top, almost 40ft. at its base, and s strengthened by huge buttresses at its ners and smaller ones erected at equal tances between them.

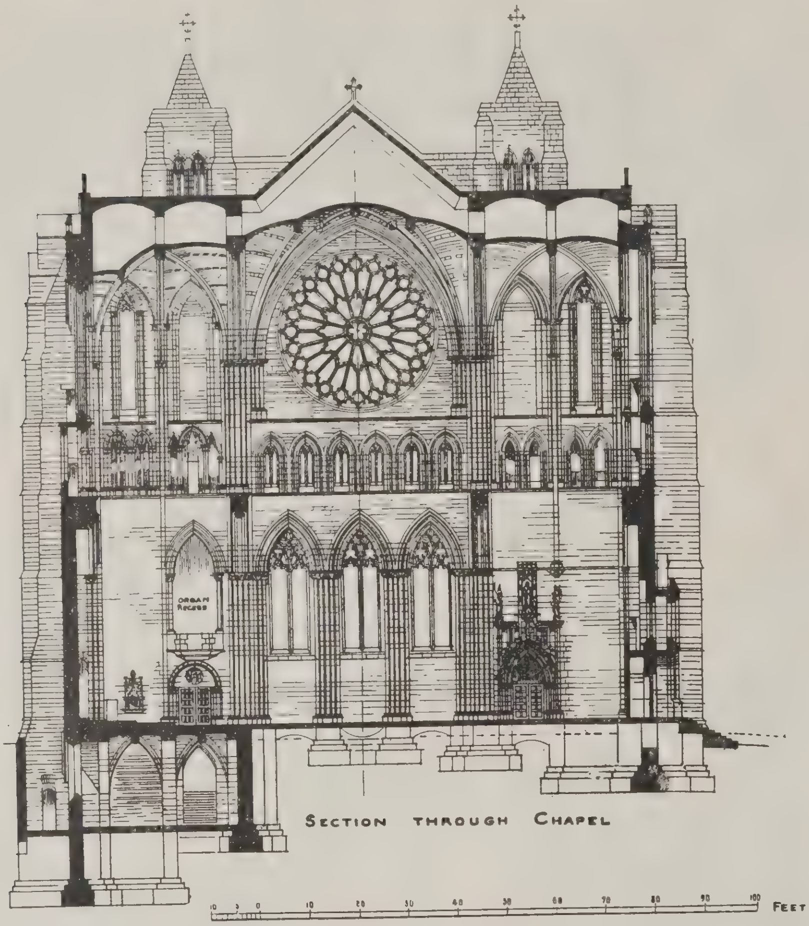
elow this building were the remains of earlier one, of a very similar character, of Seleucidan period; and lower still were remains of the old temple.

Further Discoveries at Knossos

announced by Dr. Arthur J. Evans in the imes." At the "House of Minos," on the th-west side, a broad double flight of s has been uncovered, descending at right gles to one another, while between them, rding an exceptional point of vantage, is uare bastion with a paved floor at top. higher of the two flights consists of teen steps, about 35ft. wide; the southern



DESIGN FOR LIVERPOOL CATHEDRAL BY C. A. NICHOLSON : GROUND PLAN



DESIGN FOR LIVERPOOL CATHEDRAL BY C. A. NICHOLSON.

flight is about 50ft. wide. The tiers of steps, or seats, look down on a square area, the rough paving of which seems to have been originally covered, as elsewhere, with a cement floor, and probably backed by a wall. So that here indeed was a place to witness spectacles—the germ of all future theatres—with places for about 500 spectators.

Between this stepped area and the western court of the palace a conglomeration of irregular small-roomed buildings came to light, of great antiquity. Whether or not we have here represented an early shrine and its dependencies, it is certain that these irregular buildings contained some objects of exceptional beauty and value. Here were found two large jars of the best "Palace" style—one with naturalistic figures of octopuses, the other showing a design composed of rockwork and Egyptianizing plants. Still more important was the discovery of a whole deposit of bronze vessels wedged in between two walls, with which no metal objects of the kind found at Mycenæ itself can compare either in technique or in beauty of design. They belong to the latest period of the palace—say to the sixteenth century B.C.

In the northern part of the palace a whole system of deep-walled chambers, consisting sometimes of long rectangular rooms, sometimes of large square pits, has now been uncovered. The walls descend over 25ft. sheer below the upper-floor level; and it is now clear that these dungeon-like structures belonged to the earlier Palace, and were to a great extent filled in at a later date. Here and elsewhere the continued investigation of the earlier strata has produced a multiplicity of new evidence illustrative of the long course of civilized development which on this site preceded the "Late Minoan" stage represented by the Palace in its present shape. This "Late Minoan" foundation cannot be brought down beyond the sixteenth century before our era. The Hyksos and Thirteenth Dynasty objects found in it, but even more the considerable evolution of art perceptible in its different stages, take us back at least to the beginning of the Second Millennium. But in some respect the most brilliant days of early Cretan civilization lie well beyond this sufficiently remote date. It is satisfactory to be able to record that Egyptologists, including Professor Petrie, who have recently been able to inspect the early objects from this site, have unanimously confirmed the opinion that they point to the civilized intercourse between Crete and the Nile Valley extending back to the time of the earliest dynasties—in other words, at least to the middle of the Fourth Millennium B.C. And it must be remembered that below this early civilized stratum a vast Neolithic layer 25ft. thick, itself divisible into different periods, covers the whole surface of the hill. An entirely new perspective of antiquity has here opened, and the superposition of the successive strata is as clear as in any geological section.

The evidence supplied by the Palace itself is confirmed and supplemented by that derived from the private houses of the extensive prehistoric city by which it was surrounded. One house, especially, is a miniature palace; here, as there, the whole upper-storey plan can be made out, and of the two staircases that it contains one has a double head above. Unlike the Palace, however, which is largely composed of earlier elements, this building shows a striking uniformity of structure, and exhibits the architectural style of the later palace period in its purest form. There is proportionately less rubble work here, many of the walls consisting entirely of fine gypsum blocks which had been covered by a thin coating of painted plaster. One room so constructed, with a monolithic pillar of the same material in its centre, is specially interesting from the fact that the sockets for the massive beams of the floor above are cut into the stonework, so that the whole can be reconstructed. Of the magnificent furniture once contained in this house the best idea is supplied by a tall painted jar found on the landing of the principal staircase, adorned with rich papyrus sprays partly in relief—a hitherto unexampled Ceramic technique. But the centre of interest in the house itself is the principal hall, or Megaron. The body of this hall, with its light area, column bases, and pillars, resembles the Hall of the Double Axes of the Palace itself on a smaller scale; but its inner end shows a wholly unique arrangement. It terminates here in a kind of cancellus, or raised balustrade, which originally supported two columns. Between these the balustrade is broken by a small ascending flight of three steps, on one of which stood a tall columnar lamp of porphyry-like stone in the position in which it had been originally set. This stepped central opening in the balustrade leads, after a narrow interval, to a square niche in the back wall of the room, lined with gypsum slabs, and containing the remains of a gypsum seat or throne—the occupant of which must have commanded the entire hall. It will be seen that the whole arrangement anticipates in an extraordinary manner that of the later *basilica*—the columnar nave, the cancellus, and tribune. The throne and apse-like recess may all, in one way or other, be brought into the comparison. The exceptionally fine construction of the building makes it indeed natural to suppose that it was in reality, as well as appearance, a miniature palace or royal villa, and that a Minoan prince once filled the seat of honour in its principal hall.

EDINBURGH A.A.

THE Edinburgh Architectural Association recently journeyed to Perth and visited St. John's Church and St. Ninian's Cathedral. Mr. A. G. Heiton, architect, Perth, conducted the party over the church, and gave a descriptive account of it. The date of the original foundation is unknown, but there was a building erected by David I. about the year 1126. The church was consecrated A.D 1242 by David de Burnhame, Bishop of St Andrews, and the choir and tower rebuilt by Robert Bruce in 1328. After the Reformation the settlement of a second minister to th charge was effected, and the partition wal erected separating the little church, nov known as the West Church. The nave arcad was probably erected at this time, A.D. 159 The partition separating choir from transept was built in 1773, and a third charge wa created. The church formerly containe forty altars, richly decorated and endowe The bells are interesting, and mention c them is made in 1400, 1506, &c., and ther was an organ erected, probably on the roo screen, in 1510. Seats were erected in th Great Church in 1582; galleries were erecte in 1608, and various alterations took plac in 1720, 1760, 1773. In 1892 a great improv ment was brought about in the East Churc by removing the galleries, and the paint an whitewash from the internal stonewor Similar improvements were effected in th West and Middle Churches in 1894 and 189 the galleries, however, being left in the cases. Mr. A. Hunter Crawford, in proposin a vote of thanks, expressed the hope that t day was not far distant when the obstructin dividing walls would be removed, restorin the building to its orginal state and formin a really noble church. At St Ninian Cathedral Mr. Heiton again acted as lead At the conclusion Mr. Hippolyte J. Bla proposed votes of thanks. The memb afterwards drove to Scone Palace, whe they were conducted through the palace a policies.

ST. NICHOLAS'S CHURCH, LEICESTER.

REPORT ON THE RESTORATION WORK.

Views of the Society for the Protection of Ancient Buildings.

THE committee of the Society for the Protection of Ancient Buildings has adopted the following report of its secretary, Mr. Thackeray Turner, with reference to the condition and proposed restoration of St. Nicholas's Church, Leicester :—

It appears that the important question which has to be decided is how the tower is to be treated. It is a central tower, standing between the nave and the chancel, with an aisle on either side. There are four Norman arches, opening into the nave, the chancel, and each of the aisles, and above these arches in the inside is a beautiful Norman wall arcade with square pilasters carrying the arches. I observed no sign of movement in any of the four arches. Externally, just above the level of the nave parapet, Roman tiles are built in herring-bone fashion. There are Saxon clearstory windows on the north side of the nave, which now open into the north aisle. Above the herring-bone work just mentioned the tower is in two stages of arcading—five arches on the lower stage, and six, forming interlacing arches, on the upper stage, above which there is a projecting cornice carried on corbels, which, until a short time ago, carried a perfectly plain stone parapet with short pinnacles at each end. Part of the parapet fell some time since, and has been replaced by a plain brick parapet without pinnacles. None of the shafts carrying the arches are now to be seen, although I was told that one remained behind the clock face on the south side.

Some years ago the tower was found to be in a critical condition, and it was well tied together with iron rods, and all the arcades built up flush with the wall face, so that at present the only stonework to be seen are the arches of the wall arcades, which are not moulded or ornamented in any way, and the stonework which comes flush with them ; also the cornice and the corbels which I mentioned before, and the wall face below the arcading where the Roman tile herring-bone work occurs.

I was informed that it was proposed to restore the tower, taking out the brickwork, and putting in new caps, bases and shafts. If this is done, I am convinced that most of the stonework remaining will have to be replaced with new stonework. Of course, the wall face which formed the recess work of the archway may be intact behind the brickwork, but my opinion is that if the tower is restored after this manner the result will be that to the ordinary beholder it will appear as a new tower.

I would suggest that the tower may be considered from three different standpoints—one, the architectural ; two, the archæological or historical ; three, the pictorial. The restoration aims at meeting the first of these, but I doubt whether it can be very convincing as a reproduction of what once existed.

Archæologically, as the tower stands, it is of very great interest ; and pictorially, I am convinced that no artist would wish to see a change made, and the brick parapet which has recently been added is exactly what should have been put up, although I am informed it was only put up as a temporary measure.

I examined the tower carefully inside at the bell stage, and although I found considerable cracks in the walls I feel convinced that the repairs which were done when the ties were put in have proved thoroughly effectual, and I could see no signs whatever of recent movement.

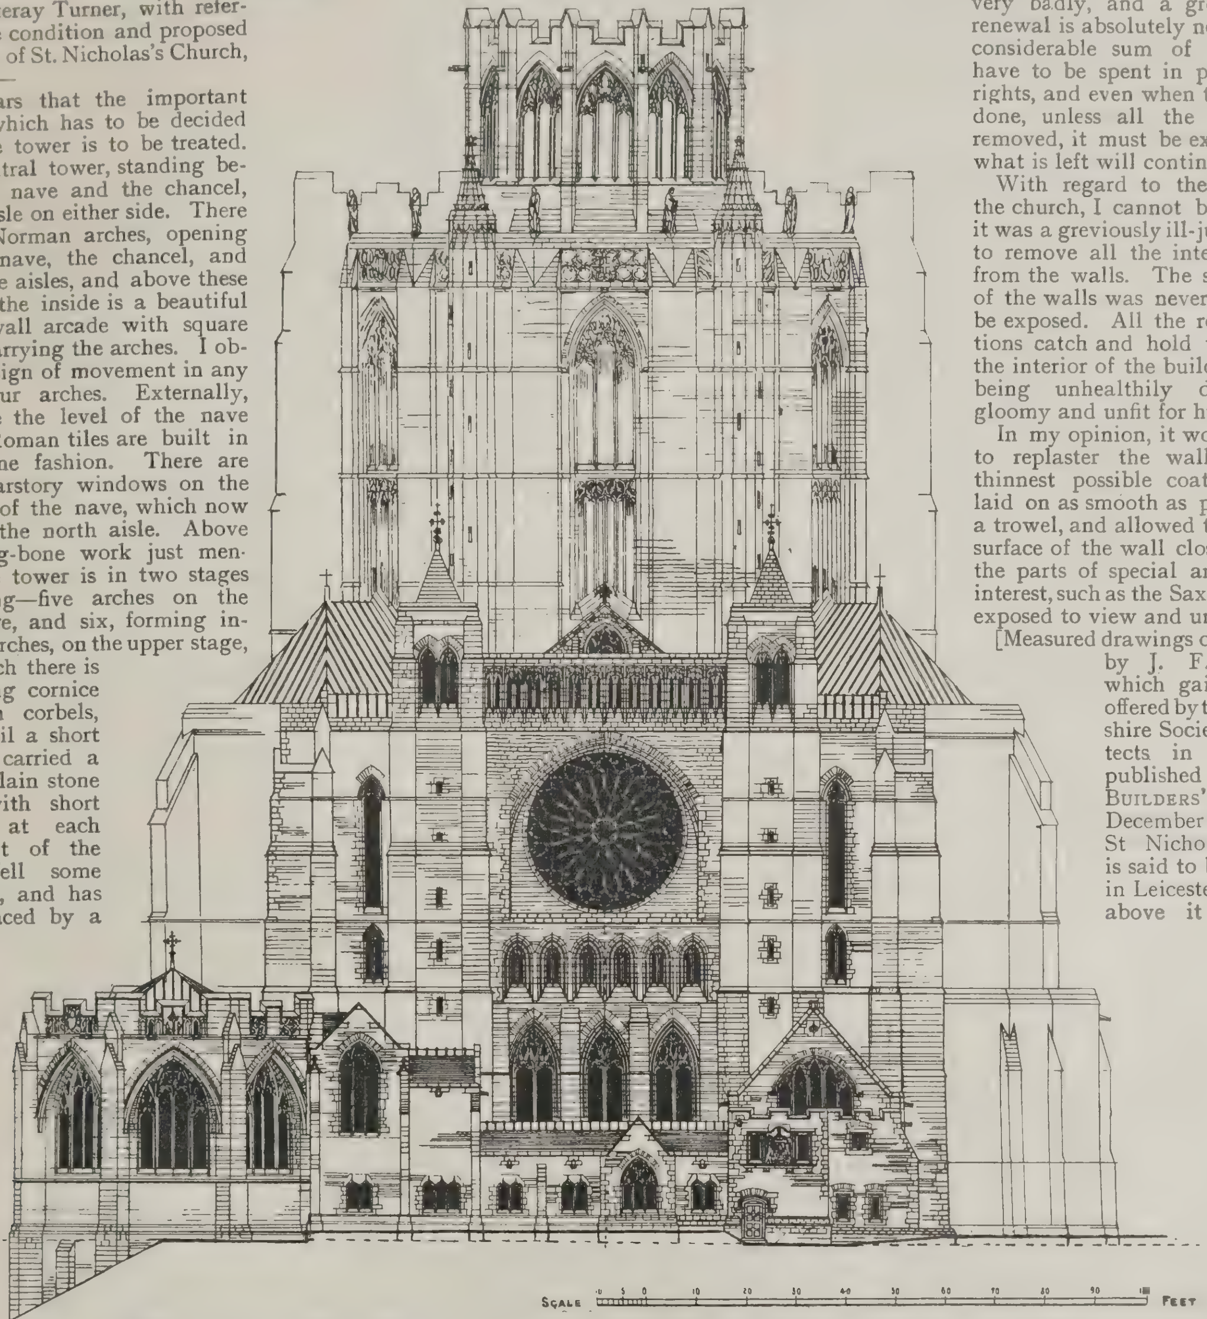
The three bells are said to be the oldest bells in Leicester. One of them is cracked, but it is to be hoped that it will not be recast, for it is too valuable a relic to be melted up for old metal.

The whole of the north aisle was rebuilt some years ago, but, unfortunately, the stonework is standing the action of the weather very badly, and a great deal of renewal is absolutely necessary. A considerable sum of money will have to be spent in putting it to rights, and even when this has been done, unless all the freestone is removed, it must be expected that what is left will continue to decay.

With regard to the interior of the church, I cannot but feel that it was a greviously ill-judged action to remove all the internal plaster from the walls. The stone surface of the walls was never intended to be exposed. All the rough projections catch and hold the dirt, and the interior of the building, besides being unhealthily dirty, looks gloomy and unfit for human use.

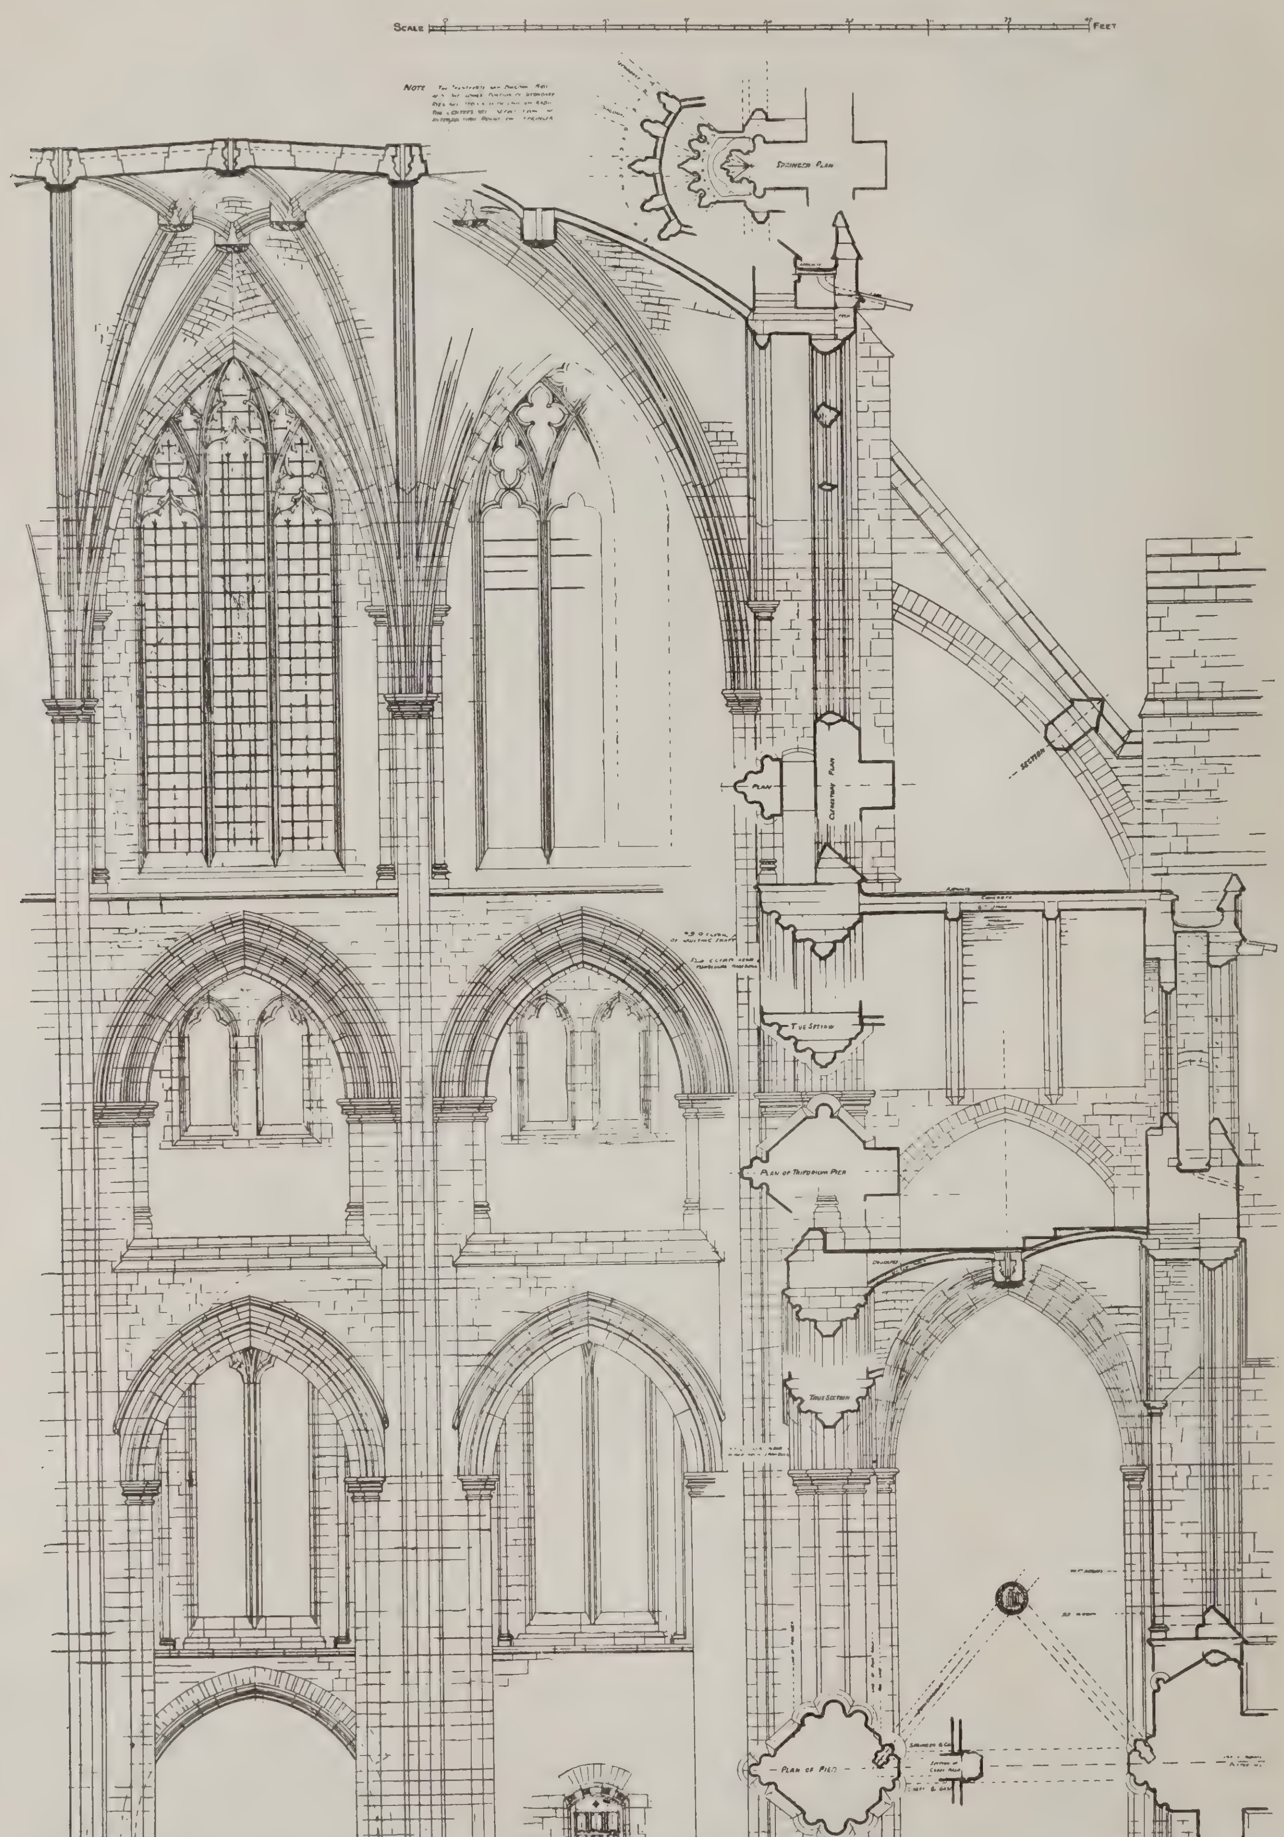
In my opinion, it would be wise to replaster the walls with the thinnest possible coat of plaster, laid on as smooth as possible with a trowel, and allowed to follow the surface of the wall closely, leaving the parts of special archæological interest, such as the Saxon windows, exposed to view and unplastered.

[Measured drawings of the church by J. F. Goodacre, which gained a prize offered by the Leicestershire Society of Architects in 1893, were published in THE BUILDERS' JOURNAL for December 10th, 1902. St Nicholas's Church is said to be the oldest in Leicester. As stated above it consists of nave, chancel, north and south aisles, and has a square Norman tower much patched with brickwork and formerly surmounted by a spire, which was taken down owing to its insecure position. Two chapels at the east end, dedicated to St. Augustine and St. Columba, were taken down as early as 1087. The new north aisle was added in 1875, and takes the place of an old Norman aisle which was taken down in the seventeenth century. The organ covers the greater portion of a fine white marble slab which is supposed to be one of the most ancient gravestones in Leicester.]



DESIGN FOR LIVERPOOL CATHEDRAL BY C. A. NICHOLSON : ELEVATION TOWARDS ST. JAMES'S MOUNT.

Mr. Henry Jones, architect, of Southport, has been appointed surveyor under the Settled Land Acts for the Towneley estate of the Earl of Abingdon.



DESIGN FOR LIVERPOOL CATHEDRAL BY C. A. NICHOLSON: ELEVATION AND SECTION OF NAVE BAY.

THE INTERNATIONAL BUILDING TRADES' EXHIBITION.

THE International Building Trades' Exhibition now open at the Royal Agricultural Hall, Islington, London, N., is more extensive than any of its predecessors, which proves how popular it has become among trade firms and those concerned in building. The whole of the space in the hall is now practically occupied, and if the number of exhibitors continue to increase some additional hall will need to be taken. This is the twenty-fifth exhibition of its kind, the five last of which have been so successfully conducted by Mr. H. Greville Montgomery. Visits will be paid by the Architectural Association, the Society of Architects, the Institute of Builders, the London Master-Builders' Association, the Institute of Sanitary Engineers, the Association of Municipal and County Engineers, and the Institute of Clayworkers, while a large party of members of the Union Céramique de France are also paying a visit to the exhibition.

The opening luncheon took place on Saturday. Mr. Montgomery occupied the chair, and among those present were Col. Edis, Mr. Edwin O. Sachs, Mr. Maurice B. Adams, Mr. C. H. Shoppee, Mr. Arnold Mitchell, Mr. W. E. Riley, Mr. E. R. Robson, Mr. Lewis Solomon, Mr. George Wragge (Eastwood & Co.), Mr. Henry Pels, Mr. Ellis Marsland, Mr. George Jennings, Mr. Mark Gentry, Mr. H. O. Cresswell, Mr. W. Grellier, Mr. Max Clarke, Mr. H. C. Montgomery and Mr. J. Montgomery.

The numerous exhibits are disposed in much the same manner as before, the stands being ranged in rows alphabetically numbered, and occupying the gallery and minor hall as well as the main hall. As these total altogether to nearly 250, it is only possible for us to notice the more important of them.

Robert W. Blackwell & Co., Ltd.

Messrs. Robert W. Blackwell & Co., Ltd., 59, City Road, E.C., occupy bay No. 30 in the gallery, where they exhibit "Ruberoid" damp-course and roofing. The former material is practically new to the market, but has, where used, met with entire approval. It contains no tar or asphalt, and will not become brittle, dry up, rot, decay, shrink or squeeze out, and, most important of all, it is an absolutely permanent insulation against damp. Messrs. Blackwell's stand is covered with Ruberoid roofing, and illustrates the method of applying it over boards in the usual way, and also over wire netting. In laying the roofing the sheathing boards should be clean and of uniform thickness, to ensure a level surface. Seams are run with the pitch of the roof and the courses lapped 2in. and cemented with "Ruberine," afterwards nailing down with tin caps. The roofing does not need to be painted, though under exceptional exposed conditions a coat of "Ruberine" paint is recommended after eighteen months. Ruberoid used as a siding and lining for buildings is also shown, as well as the firm's well-known "P and B" "Giant" insulating paper for cold-storage work and their "P and B" building and sheathing papers. These materials have secured eighteen medals at various exhibitions, including Paris and the Pan-American.

James Keith & Blackman Co., Ltd,.

Messrs. James Keith & Blackman Co., Ltd., 27, Farringdon Avenue, E.C., occupy stand No. 152, wall space. Here are shown Blackman fans of various sizes for ventilating and drying purposes; and the same fans combined with motors, illustrating the company's method of mechanical ventilation. Keith's patent hot-water boiler is exhibited in operation, arranged in connection with radiators, showing combined heating and ventilating. Registers for the admission of fresh cool or warmed air, and for the exit of vitiated air, are also exhibited. The stand is brilliantly lighted by the "Keith" high-pressure light with incandescent gas fittings. Keith's patent automatic cellar pump for draining cellars below the level of the sewers, &c., is another interesting exhibit.

George Wragge, Ltd.

The stand (No. 75, row D) of Messrs. George Wragge, Ltd., of Wardry Works and the Crafts, Chapel Street, Salford, Manchester (London showroom, 211, Shaftesbury Avenue), was specially designed in their own drawing-office. It contains exhibits of painted and leaded glass, gesso work, coloured plaster, repoussé work in metal, specimens of smith's work and electric-light fittings in various metals; whilst a special feature is made of cast-lead work, principally rain-water heads and down-pipes. The work of this firm is essentially modern in treatment; it is, in fact, a commercial expression of the Arts and Crafts movement, which, though it may have given rise to certain strange treatments and phantasies of design, still retained as its characteristic the individualism of the craftsman. In its best phases, as several prominent artists have shown, it is capable of embracing the most delightful work, while carried to ill-regulated extremes—now so popular in Germany—the movement degenerates into a mere vagary. The tendency to follow in these strange though fearful ways is doubtless strong in trade quarters, but we are glad to see Messrs. George Wragge have had the good taste not to do so. Instead, they have engaged artists who appreciate the fact that novelty is not the sole aim even among moderns, and that a studied regard for design is more satisfactory than what some wild persons are pleased to call untrammelled methods.

Frederick Jones & Co.

Messrs. Frederick Jones & Co., of 1A, Perrin Street, Ryland Road, Kentish Town, N.W., the well-known pioneer manufacturers of silicate cotton or slag wool, have a neat and practical exhibit of their various fireproofing and soundproofing specialities at stand No. 44, row B. They give special prominence to their plaster slabs and blocks, a branch of their business which appears to have largely developed during recent years. The fibrous plaster slabs, which constitute a rapid system of plastering, are too well known to require description. Messrs. Frederick Jones & Co. have lately secured the patent rights in this and other countries for what they call the "Hercules" fireproof partition block or slab. The construction of this block is simple, yet very novel, and certainly possesses merits which augur well for its success. By means of projections on the longitudinal edges of the slabs, top and bottom, running half way through the slabs on each side, the construction is rendered immovable, and the entire body made homogenous by a grouting of plaster which is poured down vertical spiral recesses or helices at the ends and at regular distances throughout the blocks. The patentees claim these blocks to be made of specially-selected light non-conducting fireproof plastic compositions, and their samples seem to bear out the claims made for them. The firm has also lately introduced and protected glass-faced plaster bricks, and a small piece of partition constructed with them is shown on the stand. These bricks can be made in any colour and have a very smooth surface. No jointing is required, as they are held in position by means of a grouting of plaster poured down circular vertical channels in the middle of the bricks.

The Simplex Steel Conduit Co., Ltd.

Stand No. 50, row B, is occupied by the Simplex Steel Conduit Co., Ltd., of 80, Digbeth, Birmingham; "Westinghouse Building," Norfolk Street, London, W.C.; and 1, Peel Street, Manchester. This is an exhibit of enamelled, galvanized and brass-cased conduit and fittings for the electric wiring of buildings, outhouses, &c., in which the wires are placed in positions where moisture is nearly always present, and where damage is likely to be caused either by mechanical or physical means. The system, which has been thoroughly brought up to date and standardized, is a method by which the wires of an electric installation are completely protected by the steel conduit and fittings. It supersedes the old method of wood casing, and can be erected with less labour; the first cost compares favourably with the wood system. The conduits are arranged for screwed or socket junctions. There are about eight grades of them and 1,000 fittings, comprising couplings, normal and sharp bends, tees, inspection bends and tees, branching, intersection and tee-jointing boxes, switch and ceiling-rose boxes, distribution switch and fuse boards, &c. The stand is built up of the conduits, with a five-way distribution fuse-board of the company's make in front. The tubes connected with the outlets of this case rise vertically, and then join a run of tube from the back in each case, thus forming five rows of tube to which the company's ceiling rose, pendant and lampholder fittings are connected. The back part of the stand has a roof of woodwork mounted on a tube framework, which also carries a show-case containing the most improved and up-to-date fittings for use with the system.

The British Compoboard Co., Ltd.

The stand of The British Compoboard Co., Ltd. (No. 63, row C) is designed to show the usefulness of their material for ceilings, partitions, walls, &c. It is a little cheaper than lath and plaster, is much quicker to erect and cover; besides which it can be papered, painted, distempered, covered with Lincrusta, Anaglypta, or otherwise treated immediately it is fixed. Compoboard is made of wooden slats 4ft. long and 1in. wide, joined in an endless web: the 4ft. length forms the width of the complete board, so that in a long board—say 4ft. by 9ft.—the end grain of the wood is on the longer edge. The price for the medium quality, single, $\frac{9}{32}$in., is 2d.; for the same quality, double, $\frac{3}{8}$in., 3d. per sq. ft.; and for the heavy quality, double, $\frac{7}{16}$in., $3\frac{3}{8}$d. The offices of the firm are at 18, Roscoe Street, Golden Lane, E.C., and their factory is at Willesden Green.

George Jennings, Ltd.

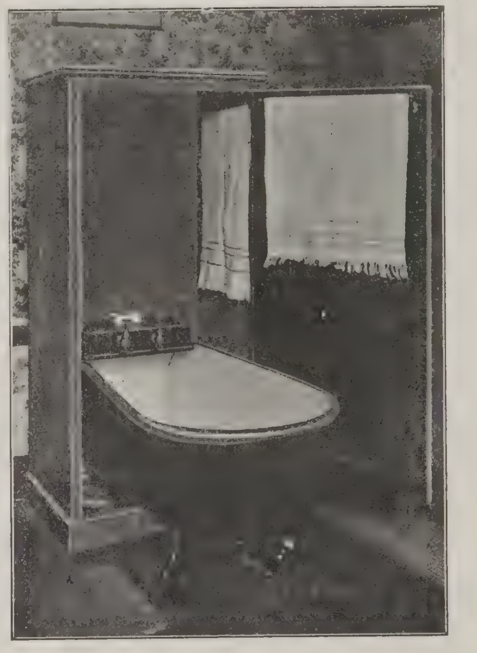
The perfection of sanitary appliances is one of the characteristics of our times, and it is impossible to over-appreciate the good which we derive from those sanitarians and manufacturers who have devoted their lives to the subject. The latest improved forms of these appliances are to be seen on the stand of Messrs. George Jennings, Ltd., of Lambeth Palace Road, S.E. (No. 71, row D). On one side of the stand are many varieties of sanitary goods, such as stoneware gulleys, inspection bends, &c., while on the other are numerous baths, lavatory basins, closets, &c. The baths and lavatories are fitted with a patent duplex valve, a very neat arrangement having a winged lever with a pointer that travels over a dial—allowing hot or cold, or any mixture of both, to enter—the outlet being controlled by another small thumb-lever at the back of the valve. Baths with combined hot, cold, sitz, wave and shower supply are exhibited; also the "Closet of the Century," a range of three isolation latrines operated by a 10-gal. cistern, the "Hyback" pedestal closet (designed for slops as well as ordinary use), the "Deep Seal" closet, the "Oxford" and the "Cambridge" urinals, three latrines as supplied to the War Office, a valveless cistern and a hospital sink. The closets are in earthenware, white ware and fireclay. They are finished in various styles, some being quite plain and others having the metal cistern encased in an earthenware body with plated fall pipe.

Maughan's Patent Geyser Co., Ltd.

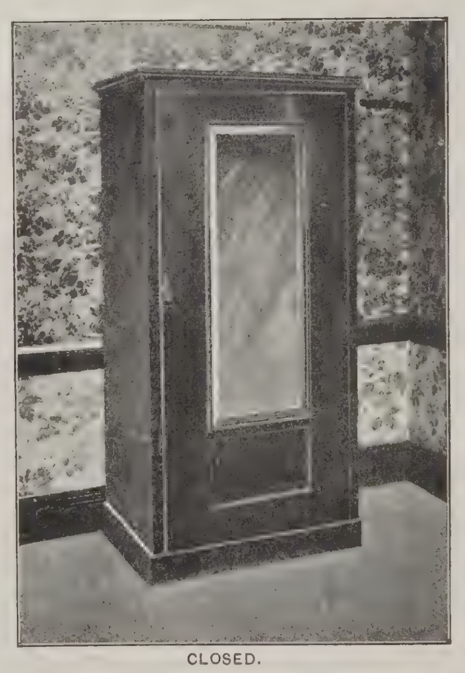
The convenience which geysers afford in providing hot water for baths and other purposes with little trouble continues to be appreciated. At stands 30 and 31, row A, several varieties of these appliances are shown by Maughan's Patent Geyser Co., Ltd., of Holywell Row, Worship Street, E.C. The "New Maughan" geyser provides an immediate supply of hot water by simply turning on the cold water and lighting the gas—the water is taken into the open spout of the geyser from cistern or main through any pattern tap, thus avoiding objections from water companies. There are no tubes, chambers or other confined spaces in the interior, and the fact that no accident has happened through these geysers during the thirty years they have been before the public proves their safety and durability—the geyser, indeed, is not affected by the "fur" of hard water nor by frost, and cannot possibly burst. Upwards of 15,000 of them have been sold. The consumption of gas in heating a 30-gal. bath is 20 cub. ft. (costing about $\frac{3}{4}$d.). The "Maughan" auto-geyser is an adaptation of the older pattern. It can be fitted in any part of the house above the taps to be supplied, and is absolutely automatic in action. When hot water is required it is only necessary to turn on any tap—whether over bath, lavatory or kitchen sink, and the auto-geyser at once starts, supplying hot water until the tap is closed, when the cold water and gas supplies automatically shut off. The "Teba" auto-geyser is another form on the same principles. One of these has been supplied at Windsor Castle for the King's bath. Baths and geysers, complete and oil geysers, are also made by this firm.

The Ellkay Patent Bath Syndicate, Ltd.

Stands No. 1 and 2 are occupied by the Ellkay Patent Bath Syndicate, Ltd., Orchard Street, Victoria Street, S.W. The Ellkay bath has been specially designed to meet the need for a full-sized plunge bath, having hot and cold water, which might be fixed in a bedroom or elsewhere without being unsightly. From the accompanying illustrations it will be seen that the bath is contained in a cabinet which, with its mirror front, forms an attractive piece of furniture, the woodwork being made to match the rest of the room. The bath is counterpoised so that it can easily be lifted back within the cabinet, a safety sink being provided to take away any water left in the bath and the drip from the taps. The bath can also be supplied with a fixed washstand (with water and waste attachment), or with a spring mattress to fix on top, forming a single bed for emergency use. Geysers can also be fitted in place of the ordinary supply. The bath can be used in any recess of a minimum width of 2ft. 6in., a depth of 2ft. (which allows the door to be fixed flush with the wall) and 6ft. high. The prices vary from £12 upwards. Ellkay baths with dwarf cabinets are also supplied from £10. The baths are themselves made of the best steel lead coated, with a large overflow and waste and an efficient trap.



OPEN.



CLOSED.

J. A. King & Co.

One of the most interesting and instructive stands in the hall is undoubtedly No. 81, row D—that of Messrs. J. A. King & Co., who are exhibiting their "Mack" patent fire- and sound-proof slabs and blocks. It should be especially noted that these slabs have been proved conclusively to stand the most intense heat, for they have withstood the most severe test made with partitions by the British Fire Prevention Committee. The "Mack" slabs are made of a special gypsum plaster and have hollow reeds embedded therein, thus forming air-chambers which make them more soundproof; moreover they strengthen the slabs and enable them to be sawn and nailed like boards. Fireproof partitions may be fixed of almost any lengths without intermediate supports with the 2in., $2\frac{3}{4}$in. and 4in. (hollow) slabs, which are 12in. wide and 6ft. long. The slabs are built up like brickwork with break joints and finished with a coat of plaster. Two-inch vertical hollow blocks are also made which require no finishing coat. Slab lintels are used for floors resting on iron joists. Special blocks are made for pugging between wood joists. The ceiling and lining slabs are 12in. wide, 4ft. 8in. long and $\frac{3}{5}$in., $\frac{4}{5}$in., 1in. and $1\frac{1}{4}$in. thick; they merely require to be nailed to the joists and floated and set with plaster. The firm are also supplying their new "Mack" patent fireproof lathing, which contains no metal work and therefore cannot rust. It is used for encasing columns, stanchions, iron and wood beams, coves, domes, ceilings, &c. Messrs. King's address is 181, Queen Victoria Street, E.C.

Stanley Brothers, Ltd.

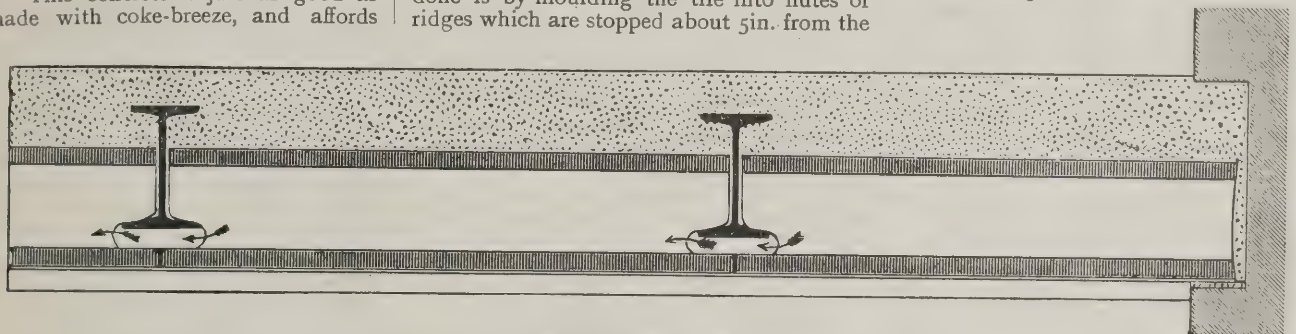
Messrs. Stanley Brothers, Ltd., of Nuneaton, have an interesting stand in row D, No. 82, where this well-known firm, whose reputation is a guarantee of uniform good quality, show samples of brown, grey granite, white and coloured glazed bricks; brown and amber glazed sinks; glazed socket pipes and connections; red and buff terra-cotta; red, buff and salt-glazed chimney pots; plain and ornamental roofing tiles; semi-encaustic paving tiles; plain and ornamental red and blue ridges, finials and ventilators; blue pressed bricks, copings, garden tiles and ventilating bricks; red, blue and buff Staffordshire quarries; glazed and unglazed malt-kiln tiles; and stoneware conduits, troughing, &c.

Joseph Place & Sons, Ltd.

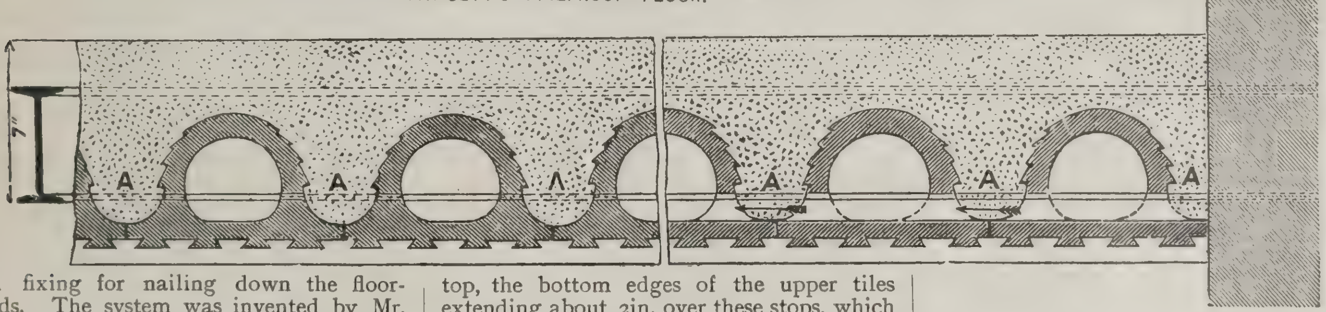
At stand No. 95, row E, Messrs. Joseph Place & Sons, Ltd., of Darwen, exhibit their salt-glazed and enamelled bricks and patent chequer bricks for downdraught kiln bottoms. The latter have increased strength, prevent rubbish lodging on the supporting walls or between the chequers, allow a 4in. pipe to stand anywhere with free draught, tie the supporting walls together and prevent lateral movement, and enable any broken or damaged chequers to be lifted out at any time and replaced without disturbing the rest.

Mark Fawcett & Co.

Stand No. 150, wall space, is occupied by Messrs. Mark Fawcett & Co., of 50, Queen Anne's Gate, Westminster, S.W. Here is shown a full-size specimen of the Fawcett fireproof floor about 20ft. square, with samples of the materials of which it is constructed. This floor is formed with steel joists, spaced at distances of 2ft. centre to centre, with hollow lintels between. These lintels are made of hard-burnt red chimney-pot earth, and, as will be seen from the illustration below, are practically semi-circular in section, with keys for the concrete which is filled in above them and for the plaster ceiling below. The lintels are slotted at each end to fit on to the lower flanges of the joists, but it is specially important to note the continuous air-space which is left under these flanges; thus, longitudinally and transversely the floor is thoroughly ventilated. The concrete used consists of the ash and clinker from steam boilers, which is first passed through a riddle and then mixed with Portland cement. This concrete is just as good as that made with coke-breeze, and affords good fixing for nailing down the floorboards. The system was invented by Mr. Mark Fawcett in 1888, since when it has been very extensively employed for Government and other buildings, both in this country and America.



FAWCETT'S FIREPROOF FLOOR.



Vulcanite, Ltd.

Vulcanite is now so established a material that there is little need to describe it; but the stand—No. 19, row A—of the firm is especially interesting for the model of a Vulcanite roof in course of being laid. The material can be used for flat roofs of wood or concrete construction, and for tanks, reservoirs, &c. It is perfectly waterproof and also fireproof, which makes it of the greatest use to builders and engineers. Vulcanite sheet asphalt for roofing sheds, farm buildings, brick kilns, &c., and for damp-courses, is also shown on the stand. The London offices of the firm are at 118, Cannon Street, and their works at Old Ford, E., and Belfast. Vulcanite roofing has now been used in this country for about seven years, during which time the company have covered roofs of ratable property of all classes to the area of about 8,000,000 sup. ft. with the most satisfactory results. The company are prepared to give a written guarantee for thirty years on all roofs prepared according to their instructions for a long period. Vulcanite is essentially a flat roofing. It can be walked upon, and has the additional advantage that it will give with any settlement of the building, and will withstand the expansion and contraction always taking place, especially between iron and concrete, which is so often the cause of an asphalted roof leaking. Vulcanite roofing may be laid either on wooden joists with 1in. boarding over, or on concrete. A roof of wood construction covered with Vulcanite roofing is thoroughly fire-resisting. In no case where a fire has occurred in a building covered by the company has the roof fallen through.

Watson, Nelson, Ltd.

At the stand of Messrs. Watson, Nelson, Ltd. (No. 86, row E) there are shown examples of the new patent fluted faced tiles this firm is manufacturing. As is well known, in wet windy weather rain is driven up under the tiles on roofs, particularly those which are of no more than a square pitch, and finds its way to the bedding mortar, through which it penetrates to the inside, rotting the laths and frequently dropping inside. This patent tile is designed to prevent this. The means by which this is done is by moulding the tile into flutes or ridges which are stopped about 5in. from the top, the bottom edges of the upper tiles extending about 2in. over these stops, which prevent the rain being driven further up the tile. At the same time the flutes ensure the rain being equally distributed over the surface, and provide a ready means for its downflow. Where roofs abut against a wall the fluted tiles will also form a good key for cement filleting.

James Hunt.

At stand No. 29, row A, Mr. James Hunt, 86, Herbert Street, New North Road, N., exhibits his patent scaffold fixer. This consists simply of a metal clamp and a chain. It is most effective in binding the poles together. The clamp fits against the upright pole just beneath the ledger. The chain is hooked to the clamp at one end and passes around the pole to attach to a screwed hook bolt at the front. There is nothing to go wrong and adjustment with the nut is easy. Builders should look at it.

Joseph Arnold.

At stand No. 110, row F, Mr. Joseph Arnold, 32, St. Paul's Road, Camden Town, N.W., shows sand for general building construction, cement work, plastering, brickmaking, water and sewage filtration, glass-making, marble polishing and horticultural purposes. Mr. Arnold's special Leighton Buzzard and Flitwick building sands are of approved qualities, coming from his extensive and excellent pits (which are 200 acres in extent). The sand for filter work is obtainable coarse or fine, either as raised or prepared to engineers' requirements. These are now widely known and recommended by eminent analysts and engineers; they are free from soluble or other objectionable matter.

Ewart & Son, Ltd.

Messrs. Ewart & Son, Ltd., of 346, 348 and 350, Euston Road, N.W., exhibit their patent geysers at stand No. 21, row A. The "Lightning" geyser has long since established itself. The firm now make a geyser for mineral oil which heats the water almost as fast as gas. These geysers are made entirely of copper and are fitted with burners that swing out for lighting, so avoiding any risk of explosion; they also have a patent "Dual" tap, which prevents accidents from burning. Ewart's "Acme" geyser stands on its own legs, and enables hot water to be drawn on either side, for bath or lavatory basin, besides providing a shower. The "Champion" geyser is specially constructed to work without water-pressure, but though well adapted for bathing and cleaning, is not suited for domestic purposes, as the water is not sealed from contact with the gas fumes, as in the "Lightning." The "Royal" and "Surprise" are other geysers made by Messrs. Ewart. The "Auto-Universal" and "Califont" patterns are for hot-water supply under pressure, so that a complete system may be served, while still another pattern is the "Lightning" boiler—providing boiling water in large quantities, so that it is specially suited to hotels, &c.

H. Blacknell.

Mr. H. Blacknell, of Fleet, Hants, occupies stand No. 22, row A, where he exhibits crowding and bearing-off barrows, hack caps, pallet boards for hack and steam-driers, loo boards, seed and postal boxes, and all kinds of nursery trays and sample boxes.

Rhodes's Patent Sash Hanging Co.

At stand No. 99, row E, the Rhodes' Patent Sash Hanging Co., of Fairholt Road, Stoke Newington, N., exhibit a new substitute for the ordinary inefficient smoothe grooved pulleys worked by sash cords, chains and wires. Their invention enables the largest and heaviest sashes to be opened and closed with the greatest ease and certainty. The hangings consist of teeth pulleys and steel chains, and are fixed to the sash and window frame in the usual way. The chains, of the finest hardened steel, are chemically treated to prevent rusting.

The "Warrington" Bond-Iron Syndicate.

The "Warrington" Bond-Iron Syndicate, Ltd., of 8, Brewery Street, Downing Street, Manchester, exhibit their patent tie at stand No. 45, row B. There are three varieties of this—one of twisted round wire for cavity work, a tie for solid work, and a special flat tie which can be used either for cavity or solid work. The advantages claimed for this bond-iron are that the greatest possible strength is combined with the least amount of material, that it is very cheap, that it does not form any obstruction in the cavity for mortar and other matters to lodge upon, that it cannot hold or convey damp, and that it obviates the necessity for through headers in faced walling: moreover, the tie does not require the cutting or clipping of bricks, as it can be bent to fit into the courses and thus effects a great saving of labour. The tie for solid work is made in 12's wire for stock or other fine-jointed facing, and in 10's wire for common work and outside walling. It is coated with a special protective against oxidation. These ties have been supplied to H.M. Ordnance Building Department, and are specified by architects and employed by builders throughout the country. Upwards of five millions of them have already been used.

Columbian Fireproofing Co., Ltd.

All those who are interested in fireproof construction will no doubt take particular note of the stand (No. 55, row C) of The Columbian Fireproofing Co., of 37, King William Street, E.C. In the "Columbian" system of fireproof floors steel bars from 1in. to $2\frac{1}{2}$in. deep are suspended from steel stirrups that hang over the joists; $3\frac{1}{2}$in., 4in. and 5in. heavy ribbed bars are put between main girders or resting on walls, and thus the use of ordinary steel joists is eliminated. In panelled floors all the joists and main girders are completely encased with concrete and the underside protected by slabs secured with concealed anchors, in spans up to 8ft., using 2in. and $2\frac{1}{2}$in ribbed bars hung in stirrups to carry from 4 cwt. to 12 cwt. The double form of construction is similar, except that the bars are laid on the lower flange of the joists and a wooden centering placed below to receive a $2\frac{1}{2}$in. concrete ceiling. Columns are encased with not less than 2in. of concrete. The company prepares plans for floors on their system free of charge. They have just had completed new constructional works at St. John's Wood, where the latest machinery has been installed.

C. Chancellor & Co.

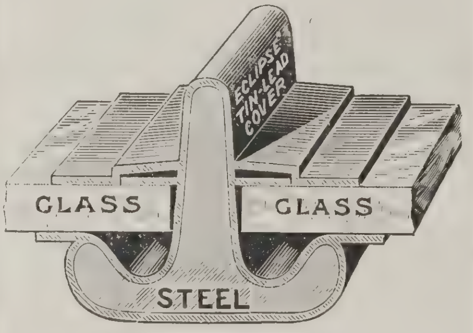
Messrs. C. Chancellor & Co., of 13, Clerkenwell Road, E.C., exhibit their well-known "Velure" and "Stripso" at stand No. 14, row A. "Velure"—which is a new and perfected Japan paint intended to supersede varnish, with remarkable spreading, elastic and weather-resisting properties—appears to be making rapid headway. Amongst other important places where it has been used are Windsor Castle, the King's estate at Sandringham, and several of the most important hospitals, *i.e.*, the London Hospital, Middlesex Hospital, Metropolitan Hospital, &c., as well as a large number of municipal and other public buildings, hotels, &c. The makers claim that owing to its elasticity "Velure" is not only the most perfect in colour and surface, but the most durable paint extant, and they invite consumers to put it to the most severe tests, particularly to tests which other paints have failed to answer. One coat equals two coats of ordinary paint and one of varnish. It is supplied in 120 colours, is washable, and will not crack, chip, peel, blister or fade. "Stripso" is a paint-remover. It is spread over the surface, left for a short time, then washed off with clean water. Either fresh- or sea-water is equally good for the purpose. The material has been largely used for yachts.

The Offa Ventilating Co.

The exhibit of the Offa Ventilating Co., of 64, Basinghall Street, London, E.C., at stand No. 13, row A, consists of the various types of their ventilators, including a new one especially introduced for hospitals and infirmaries, having an iron face-plate and centre handle. They also exhibit a working model showing the action of the "Offa" ventilators in distributing the air entering a room so that no draught can be felt. These ventilators possess the further advantage of being absolutely sanitary, having no projections to hold dust or germs, thus being especially suitable for hospitals, &c. The price of the No. 1 pattern for hospitals, with iron-face plate, is 10s. 6d. nett each.

Mellowes & Co.

Messrs. Mellowes & Co., of Corporation Street, Sheffield, and 28, Victoria Street, Westminster, S.W., exhibit at stand No. 58, row C, a wooden structure entirely glazed on their patent "Eclipse" system. The bars which support the glass are of steel encased with strong tin-lead metal, with webs on either side which are rubbed down on to the glass (see accompanying illustration). No putty or packing is required; no maintenance is necessary; and ample allowance is made for contraction and expansion. As the result of twenty years' experience of their tin-lead fixed in Sheffield, Woolwich and Manchester (probably three of the worst places as regards smoke, chemicals and atmospheric conditions that could be selected) Messrs. Mellowes claim that it is imperishable, that it is not "drawn" by the sun, and is entirely unaffected by atmospheric action. It is adapted to wood bars as well as to steel, and, unlike copper or zinc, "beds" close on to the glass, so keeping out all dirt and dust. A copper or lead guard is provided which, whilst allowing for the outlet of steam and for ventilation, prevents snow or rain drifting through. Millions of superficial feet of roofing have been glazed on this system in many of the most important buildings throughout the kingdom.



MELLOWES' PATENT GLAZING.

Cloisonne Glass Co.

The Cloisonne Glass Co., 66, Berners Street, Oxford Street, W., have a most attractive stand (No. 59, row C)—of white painted "Veronese" plaster in Georgian style. The windows are filled in with pleasing designs in Cloisonne glass, while inside are eight lanterns and other fittings (by the Electrical Fittings Co.) also fitted with this new decorative glass. The glass can, of course, be used for any purposes where ordinary glass is applicable. It is made at Islington only, and in the following manner:—The design is first traced on paper. A sheet of plain glass is then laid over it, and a length of wire put to the contours of the main lines. The wire is next cemented in place, after which powdered glass—in specially prepared globules—is filled in the spaces level with the top of the wire. This filling is then cemented together and a sheet of plain glass fixed on top, the whole bound together at the edges with lead. In this way a very distinctive and pleasant effect is obtained.

B. Ward & Co., Ltd.

Messrs. B. Ward & Co., Ltd., concrete, mosaic and wood-block specialists, of 38 & 39, Parliament Street, S.W., have an interesting exhibit at stand 80, row D. Their granite-concrete paving laid *in situ*, grooved for foothold and with channels formed in the surface for draining, has long been recognized by the War Office and other experts as being the most durable, sanitary and easily-cleansed stable paving. It is laid by the firm *in situ* on a brick bed provided and put in by the builder, and, besides being agreeable in appearance and colour, can be tinted either buff or red as desired to the gangways or the open yards. Any material laid down in the form of bricks is liable to get kicked loose and to allow the urine to percolate through the joints, generating ammonia and injuring the health of the animals. In connection with their stable paving, Messrs. Ward have designed and manufactured special stable pots, interceptors and yard gulleys, which are simple in construction, strong, efficient and easily fixed. The concrete paving laid by the firm is suitable for cowhouses, dairies, kitchens, cellars, &c.; it can be put down rapidly and inexpensively by Messrs. Ward's staff of experienced layers. Special attention has been given by this firm to the designing of fireproof floors of maximum strength with the minimum of heavy and unnecessary steelwork. Their floors can be executed with either flat or curved soffits, and are finished on top with their granite-concrete paving, or screeded for wood-block flooring or mosaic. Messrs. Ward are always willing to submit steelwork schemes for approval on receipt of particulars as to span, &c. They are now the sole proprietors and manufacturers of Charteris & Longley's patent perfected wood-flooring blocks, which have no loose dowels to be left out by careless or inefficient workmen, and give a great wearing depth. All such floors are laid in special mastic composition, and the firm guarantee that the blocks are prepared at their own mills from the best material after treatment by their Shapland process of seasoning, which leaves the timber sound instead of deteriorating it, as in ordinary dessication. A number of samples of parquet flooring are shown on the stand, as well as mosaic paving, which is laid by the firm's own special workmen in Roman and Venetian marble mosaic. This mosaic work, combined with concrete for staircases, is also largely used. In constructing concrete staircases, both *in situ* and at their workshops, Messrs. Ward have had a large experience, and have recently, amongst other important works, executed those at the New Baltic Shipping Exchange, St. Mary Axe, E.C., and Thanet and Temple Bar Houses, Fleet Street. These staircases are formed with the firm's artificial stone steps and landings, faced with Venetian marble mosaic, and fitted with patent leaded treads; the result is a handsome and durable staircase. Messrs. Ward & Co.'s new patent treads, which they claim to be the simplest and most effective and economical on the market, have the special advantage of being made in the form of a lead grid, the lead dots which give the foothold being finished flush with the tread of the steps, so that they offer no raised or sunk surfaces to harbour dirt.

John Tann.

Mr. John Tann, lock and safe engineer, of 11, Newgate Street, E.C., and Reliance Works, St. Stephen's Road, Old Ford Road, E., who occupies stands Nos. 153 and 154, wall space, is the sole patentee and manufacturer of the well-known "Anchor Reliance" safes, which are his speciality. These are made of bent steel plates without joints at the corners, with immovable flanged backs, and are fire- and burglar-proof. Various kinds of safes are shown on this stand, such as for dwelling-houses, commercial purposes, for keeping jewels and cash, and also special thief-resisting plate closets. There are also exhibited iron and steel doors for all purposes, fire-resisting warehouse doors having a chamber packed with fire-proof composition, party-wall doors, insurance or tariff doors to meet the insurance companies' requirements; sliding party-wall, plate-closet and strong-room doors; combined strong-room doors and gates; and bankers' fire-, burglar- and drill-proof doors with steel vestibule.

J. Sagar & Co., Ltd.

In view of the revolution in the science of joinery which has occurred in modern times by the use of machinery, everyone connected with the building trade will be greatly interested in the exhibit of Messrs. J. Sagar & Co., Ltd., saw-mill engineers, of Canal Works, Halifax, at stand No. 137, wall space. There are three special machines which show the high pitch of excellence wood-working machines have now reached—the "Premier" hand- and roller-feed surface planing, moulding and thicknessing machine; a mortising and boring machine; and an improved tenoning machine. The firm also exhibit vertical-spindle moulding, band-sawing, cutter, grinding and various planing machines, and a four-cutter moulding and planing machine.

Walter P. Notcutt.

At stand No. 61, row C, is to be found the exhibit of Mr. Walter P. Notcutt, whose offices and showrooms are at 19 & 20, Holborn Viaduct, London, E.C. Mr. Notcutt is the British representative for the Bommer spring hinges and the Simonds Manufacturing Co., of Fitchburg, Mass., U.S.A. The Bommer spring hinges are manufactured entirely of wrought metal, and are claimed to be absolutely unbreakable. They are well made in polished brass, brass plated, japanned steel and a variety of other finishes suitable to any scheme of decoration. The tension being readily adjustable, the door can be made to close as softly or quickly as desired. They are as easily fixed as an ordinary pair of butt hinges, and for this purpose the tension can be entirely taken off. Bommer hinges are made for both single- and double-acting doors. The Simonds Manufacturing Co. are makers of every variety of high-grade machine knives for planing, moulding, &c. Mr. Notcutt shows also a complete line of saws, including inserted point and solid tooth circular, band, cross-cut, hand and mill saws.

T. Wragg & Sons, Ltd.

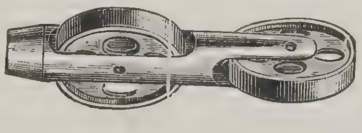
A large number of pipes, gulleys, &c., are shown at stand No. 69, row C, by Messrs. T. Wragg & Sons, Ltd., of Swadlincote. This firm makes a speciality of patent pipes—Hassall's single- and double-lined, Stanford's, the "Spiralitic" and Wakefield's corrugated socket, as well as patent gulleys, joinders, inspection interceptors, blocks for manholes, locking stoppers, disconnecting syphons, junction and invert blocks, Merril's patent trough closet and Monk's patent chimney pot. Each pipe is tested up to 20lbs. to 30lbs. per sq. in. Bricks, copings, tiles, &c., are also made by the firm.

R. H. Mudd & Co.

At stand No. 119, row F, Messrs. R. H. Mudd & Co., of Hogarth Engine Works, Chiswick, W., are exhibiting Faija's patent cement-testing plant, of which they are the sole manufacturers. The cement-testing machine is extremely simple in working parts. The Faija apparatus also includes nests of moulds for coating briquettes, a cement gauger that ensures better and more regular results than by gauging by hand, a hopper for determining the weight per bushel of cement, sieves of various-sized meshes, and an apparatus for determining the soundness of cement in a few hours. This last is known as the boiling test, and is based on the principle that moist heat accelerates the setting of cement, and that if judiciously applied an age of several days may be artificially given to a cement in a few hours. A sound cement acquires great hardness in a short time when treated in this apparatus, but an unsound one, or one that would under ordinary conditions "blow" when used in working, is caused to develop this characteristic in a few hours.

H. Hart.

Stand No. 12, row A, is occupied by Mr. H. Hart, 29, Settles Street, Commercial Road, E., maker of chimney and drain-cleaning apparatus. These include machines composed of malacca canes, fitted with interchangeable brass connections, in lengths varying from 2ft. to 4ft., and improved top with expanding drain stoppers and drain-cleansing tools of all descriptions. Stout ash sewer rods, with shovels and scoops to connect to them, are also shown.



Clark, Hunt & Co.

The exhibit of Messrs. Clark, Hunt & Co., of 159-60, Shoreditch, E., the noted builders, ironmongers, &c., at their stands in bay No. 11, and wall space No. 142, includes the "Caterer" restaurant range and steam-cooker, and "Bailey's" patent geyser-boiler range (both in action); the "Middlesex" kitcheners, which are made in either a portable form or to fix; "Francombe's" warm-air slow combustion stove; the "Nautilus" grate, with mantel registers, two wood mantels and two marble chimneypieces. They are also showing brickmoulds; builders' and engineers' tools; pulleys and shafting; brass door-furniture; and electric light and bell fittings.

Julius Hulsen & Co.

Mr. Julius Hülsen & Co., of Collingwood Buildings, Collingwood Street, Newcastle-on-Tyne, show at stand No. 93, row E, specimens of their precipitated carbonate of barytes for the prevention of scum and discoloration on facing bricks, terra-cotta, tiles, &c. Scumming is chiefly caused by soluble salts in the clay and in the water used for tempering it. These salts, by the combined action of water and heat, are driven to the surface of the brick. By adding precipitated carbonate of barytes (a creamy liquid) to the clay the composition of whatever soluble gypsum and scum may be in it is so changed as to be harmless; and the surface of the brick or tile is thus kept unblemished. Duplicate samples made from the same seams of clay, with and without the barytes, are shown on the stand.

Cobbetts.

Messrs. Cobbetts, of Virginia Road, Bethnal Green, E., exhibit at stand No. 130, wall space, specimens of American hardwoods, mahogany for shop-fitting purposes, oak and maple flooring; also specialities in square- and round-turned balusters and newels, machine-carved mouldings, whitewood and mahogany for fascia boards and counter top, &c. Goods to the value of £5 and upwards are delivered free by the firm anywhere in London.

Moore's Patents Co., Ltd.

Reversible windows are shown at special position No. 5, row F, by Moore's Patents Co., Ltd., of Nightingale Hall, Lower Edmonton, London, N. The sashes in Moore's, patent window are hinged when at the bottom, and then a person, by turning a button, can bring them inside on their hinges for cleaning, &c. The frames are now made the same as ordinary frames, or the fixed frame may be solid on the opening side. The invention is also applicable to existing windows. Moore's patent casement windows open outwards and have an angle-iron water-bar on the head and sill on which the sash slides, making it perfectly water-tight. Door-springs and fanlight openers are also shown on the stand.

North Devon Clay Co., Ltd.

The North Devon Clay Co., Ltd., of Torrington, proprietors of the Marland Brick Works, exhibit specimens of their bricks at stand No. 125, row F. Impervious buff facing, vitreous paving, damp- and acid-proof engineering and sewer bricks are made by this firm, all from the Devon stoneware clays—the decomposed detritus from the Dartmoor granite. The valley in which the works are situate (about six miles from Torrington Station, with which the company are connected by a 3ft. gauge light railway) is the only place in North Devon where such a deposit is known to exist.

Emdeca Decorations.

The exhibit of the Emdeca Metal Decoration Co., Ltd., at stand 57, row C, is one of the most attractive in the hall, both as regards the stand itself and the decorative work displayed. The Emdeca decorations are too well and favourably known to need elaborate description. The annual output of these decorations now amounts to over half a million square yards. This shows their great popularity. The patterns exhibited are original and artistic; a fleur-de-lis design on white ground for filling with a self-coloured pattern for dado is noteworthy. A new and interesting feature is an article destined to prove a serious competitor to plaster for ceilings. It is made of 28-gauge Bessemer steel sheet, stamped under great pressure with various ceiling designs. These ceilings can be put on to wood or iron beams, and require no plaster. We marvel how it is possible to produce these goods at a price as cheap as plaster and cheaper than ordinary paper relief decorations. The London offices of the company are at 97, Queen Victoria Street, E.C.

C. E. Johnson.

Stand No. 7 in the gallery, row A, is occupied by Mr. C. E. Johnson, 118, Hoxton Street, N. Here are shown all kinds of timbers used by builders and others, including mahogany, wainscot and American oak, walnut, beech and all descriptions of hardwoods in logs, planks and boards, as well as Kauri, Oregon, pitch- and yellow-pine, oak, teak and pitch-pine flooring for secret nailing, hardwood mouldings and electric-light casings, and lavatory seats.

Sissons Brothers & Co., Ltd.

Special position No, 11‘ row E.—an effective stand with scroll work painted white—is occupied by Messrs. Sissons Brothers & Co., Ltd., Layton's Buildings, 199B, Borough High Street, S.E. A number of partitions finished with paint in various pleasing colours are exhibited, as well as work distempered with Hall's well-known sanitary water paint.

Powers & Deane, Ransomes, Ltd.

Messrs. Powers & Deane, Ransomes, Ltd., Plymouth Wharf, Wharf Road, Cubitt Town, E., exhibit at stand No. 115, row F., the patent "M.P." fire- and sound-proof floor and ceiling, with rolled steel joists, patent tiles, coke-breeze concrete (5 to 1), and finished with Granolithic patent fireproof doors made of two steel stampings only. Specimens of compound steel girders, stanchions and roof trusses are also shown.

Sutcliffe, Speakman & Co., Ltd.

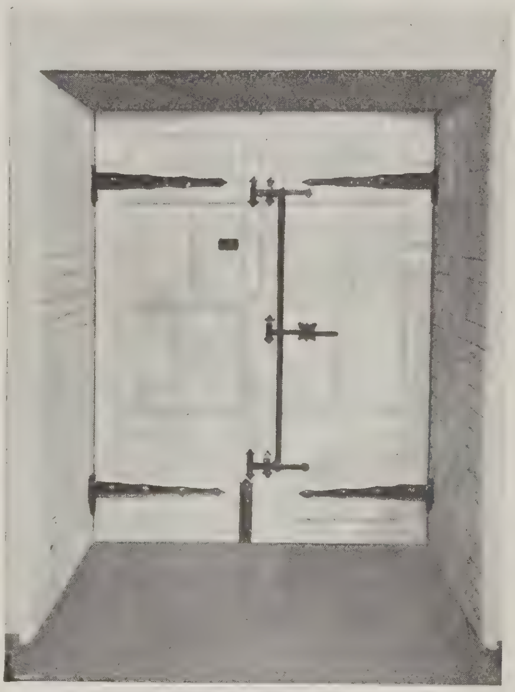
At stand No. 133, wall space, Messrs. Sutcliffe, Speakman & Co., Ltd., of Leigh, Lancs, show their special machinery for making clay bricks, and numerous samples of artificial stone bricks, &c. That which is quite new is their process for making indurated cement-concrete paving flags. This firm are now able to do what has hitherto been impossible, *i.e.*, to manufacture and harden concrete goods of all kinds in a period of only three days. In that short time strengths are obtained which have never been equalled. For instance, in three days they have obtained tensile strengths of 936 lbs. per sq. in. with standard sand and cement 2 to 1. The usual twelve months' test is about 500 lbs. In crushing strength they have obtained in six weeks' time tests of 7·85 tons per sq. in. with 3 to 1 of cement, the aggregate being limestone chips. At this great pressure the test piece was unbroken, the limit of the machine having been reached. Granite stands in compression 4 to 5 tons per sq in. They also show bricks made from gas lime and clinker and from lime and sand, and are manufacturing them in the exhibition. They claim to make clinker and lime bricks equal in strength to Staffordshire bricks.

The Pulsometer Engineering Co., Ltd.

An interesting exhibit at stand No. 41, row B, is that of the Pulsometer Engineering Co., Ltd., of Reading. The Pulsometer pump works as well hanging on the end of a chain as on a solid foundation, and at the stand the method of slinging it for work in foundations, &c., is shown. Stones, sand, &c., that cut the valves of ordinary pumps to pieces have no effect on the "Pulsometer." This company also show a boiler on wheels, carrying a pulsometer attached to its side on a bracket from which it can be detached at a moment's notice. For temporary work the arrangement is one that should be very useful. A working model of an air-lift pump is shown. These pumps are designed to bring up more water than any other form of pumping apparatus from great depths, such as from a bore hole. The company's "Union" pipe shown is of wrought iron fitted with faced malleable flanges with slotted holes for the bolts. The "Caryl" donkey pump is also noticeable. Its working parts are few, thus reducing the liability to derangement to a minimum. The centrifugal pumps, of which one example is shown, allow the side plate of these pumps to be removed and the interior inspected without the necessity of breaking the joints of either suction or discharge pipes. The pumps take in their suction on each side, so that the propeller is always in equilibrium and all unnecessary friction done away with.

The British Uralite Co., Ltd.

The British Uralite Co., Ltd., 50, Cannon Street, E.C., occupy special position No. 3, row D, where samples of their material are exhibited. Uralite is chiefly used for roofing, ceilings, partitions, &c., but it may be employed for many other purposes. On this stand a deed safe and despatch box formed of it are shown, as well as painted, distempered and veneered specimens. Uralite is composed of asbestos fibre, silicate and bicarbonate of soda, together with a small amount of chalk. It is quite fireproof and damp-proof, a good insulator (which makes it valuable for boiler coverings and for cold storage) and weathers well. Some fire tests with the material which were conducted at West Kensington, in the presence of eighty visitors, clearly showed its fire-resisting properties. The test took place in a hut, 11ft. by 6ft. by 7ft. 4in. high to the eaves, constructed partly with six thicknesses of Uralite and two of deal, with upright timber studding, and partly of five thicknesses of Uralite and three of deal, solid, with six fire-resisting doors. Inside 6 cwt. of wood soaked with paraffin was set light. After a considerable time an examination was made, and it was found that the hard and soft Uralite next to the fire were porcelained, while that behind was in good condition, the first layer of wood being somewhat charred: otherwise it was in good order, and the outside of the partitions had never got more than warm to the hand. The armoured doors were similarly satisfactory. The above illustration shows one made by Messrs. Mather & Platt, cased with steel sheets and lined with Uralite.



ARMOURED DOOR LINED WITH URALITE.

Palmer's Travelling Cradle, Ltd.

The utility of such a device as Palmer's well-known travelling cradle can hardly be overestimated, for not only is it a time-saver but it does away with the risk incurred when painting or otherwise working on ladders on the walls or under the roofs of buildings. It is familiar to all persons connected with the building trade, and the fact that it is extensively used all over the kingdom proves how much it is appreciated. It is easy to fix, can be raised or lowered without difficulty, and being a steady platform, gives the workman both hands free to carry out his operations.

Colledge & Bridgen.

Messrs. Colledge & Bridgen, Midlar Works, Wolverhampton, occupy stand No. row A, in the gallery. Here is shown Fisher patent attachment for preventing acciden occurring when windows are being cleane repaired or painted. The fittings consi mainly of pivoted hinges which, while allov ing the sashes to slide up and down in th usual way, also enable them to be opene into the room within the safe reach of anyor standing on the floor. The fittings are mac in malleable iron, sanded brass, polishe brass and gunmetal in sets costir 5s., 7s. 6d., 9s. and 11s. 6d. respectively

Major & Co., Ltd.

The speciality which Messrs. Maj & Co., Ltd., of Sculcoates, Hull, a showing at bay No. 22 in the galle is their wood preservative and stai "Solignum." This preparation com bines the properties of a reliable woo preservative with that of a reddisl brown stain of good appearance. F woodwork going under ground it is mo valuable. "Solignum" is manufacture in three shades of brown. The ligl shade is mostly used for fences, &c., th medium and dark shades for hal timber work. Its appearance is illu trated at this stand on a small mod half-timbered house. The half-timb work is treated with the medium shad of Solignum, while the fence and gat in front are treated with the light shad In response to constant requests for othe colours the firm are introducing wha they term "Solignum B Stains" in re and green shades. These stains ar permanent indoors, but the colours alte on exposure outside. Samples ar shown. The roof of the building, i fact, is treated with the red shade an the door with the green.

The Asbestos and Asbestic Co., Ltd.

At stand No. 85, row E, the Asbesto and Asbestic Co., Ltd., of 27, Billiter Build ings, Billiter Street, E.C., exhibit insulatin materials for cold-storage plants of th special kinds adopted in America by suc firms as Armour & Co., and for the refrigera ting of the great American railroad com panies' cars; magnesia, sponge-felted an other pipe and boiler coverings for high- an low-pressure steam—very practical in thei application; special deafening materials easily fixed and doing away with obsolet methods; and a general line of made-u asbestos goods, such as fire felt, millboar &c.; and, as usual, specimens of thei Danville asbestic fireproof plaster, of suc signal success in a great many large build ings in London, such as the Carlton Hotel the Stock Exchange, the Pall Mall Deposi Co., Basildon House, and other buildings o similar importance, and which has prove in four instances where fires have broken ou to have saved the buildings. The lates thing this firm is introducing into Englan is the keystone hair insulator, which i also exhibited. This enables refrigerating plants to dispense with the great thickness of walls now considered necessary. A furthe and important exhibit is the Manville fir extinguisher (registered), a chemical powde put up in a decorated tube 22in. by $2\frac{1}{2}$in in diameter. The powder will not freez or cake, nor is it affected by damp o deteriorated by age Unlike liquid extinguishers, it will not damage the mos delicate fabric. It is a most effective extinguisher of acetylene and electrical flames which are most difficult to put out with water or other liquids. It should therefore prove of the greatest use to all concerned with buildings.

INAL SECTION. C. A. NICHOLSON, ARCHITECT.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Bratt, Colbran & Co.

At Stand No. 132, wall space, Messrs. Bratt, Colbran & Co., 10, Mortimer Street, W., exhibit wood and iron mantels, dog grates, electric-light fittings, door furniture, &c. Messrs. Bratt, Colbran are also the patentees and makers of the "Heaped" and "Valley" fires, which are shown burning.

H. G. Goodwin & Son.

The exhibits on stand No. 26, row A—Messrs. H. G. Goodwin & Son, 16, Charles Street, Hatton Garden, E.C.—comprise a staircase, front doors, sashes and frames, carved mouldings and overdoors, and compoboard. The firm make every description of oinery and give special attention to architects' designs.

F. A. Fawkes.

An especially pleasing oak mantel with small inlays of brass is shown at stands Nos. 48 & 49, row B, by Mr. F. A. Fawkes, Anchor Works, Chelmsford. The work is straightforward in design and well executed. A white-painted wood mantel and an enriched doorway are also exhibited.

Beaven & Sons.

Messrs. Beaven & Sons, 27, Victoria Street, S.W., exhibit at stand No. 92, row E, a new combined gas cooker and hot-water circuating boiler (Rasch's patent) by which hot water is obtainable throughout the house in ifteen minutes at an average cost of 1d. per hour—a very effective and convenient apparatus.

The Coalbrookdale Co., Ltd.

At stand No. 3 in the arcade the Coalbrookdale Co., Ltd., of 141, Queen Victoria Street, E.C., exhibit the patent "Bostel" grate, the feature of which is that it can be manipulated for the fire to burn either sunk in the hearth or tilted up to burn with he bars raised. When lifted up the grate nduces a quick draught and the fire soon becomes a glowing mass of smokeless fuel; he bars are then lowered, bringing the fire well forward so that practically all its heat s given out into the room, the gases passing up the chimney quite cool.

The Decorative Marmorite Co.

The Decorative Marmorite Co., of 55, Queen Street, Camden Town, N.W., occupy tand No. 66, row C, where they exhibit pecimens of "Marmorite" as adapted to various purposes. This material (which comes from Belgium) is a composition of glass with metal salts, and can be obtained n various tints. It is solid in colour throughout and is specially adapted for fascias, rade tablets, decorative wall-panelling, &c. t has a high and imperishable polish, and has been very largely used on the Continent with great success. It may be obtained plain or decorated, the decoration being carried out by sand-blasting the design and afterwards painting over the parts.

Marmart Co., Ltd.

Messrs. The Marmart Co., Ltd., of 33, Old Queen Street, Westminster, S.W., occupy pecial position No. 6, row B. Here are hown specimens of "Marmart," a new product intended to replace marble, glass or wood for engraved shop-fronts, showplates, and for house, street and general decoration. It is produced in every colour and also veined. The prices are claimed to be lower han those of marble, slate or wood for imilar purposes. The following are the prices for black "Marmart":—With gold lettering, 11s. per ft. sq.; lettering and coloured trade mark, 13s. per sq. ft.; reproduction of coloured show card or with elaborate coloured design, 15s. per sq. ft. Coloured "Marmart" costs 1s. per ft. sq. extra.

Messer & Thorpe.

At stand No. 112, row F, Messrs. Messer & Thorpe, 8, Quality Court, Chancery Lane, W.C., exhibit their patent bucket fire-extinguisher, which has been awarded gold and silver medals at numerous exhibitions. It consists of a metal tank or reservoir in which one or more nests of buckets are submerged; so that each bucket is drawn up full of water. The buckets are held in position by guides, and cannot become jammed, neither can they be displaced when drawing them out. The tank has a sealed cover to prevent evaporation and prevent the water becoming impure—so protected, it may remain in the tank for twelve months without being changed. The apparatus is very neatly arranged and extremely compact. In every case, after the nest of buckets has been withdrawn enough water remains to fill five more—so that in a 10-bucket tank fifteen buckets of water are always in readiness.

Irish Building Materials.

At stand No. 15 in the minor hall the Department of Agriculture and Technical Instruction for Ireland exhibit an extensive collection of Irish building stones and materials, in which so much interest has been taken by those who visited the recent exhibition of these materials at the Imperial Institute. The exhibit includes samples of the varied and excellent building materials and marbles in which Ireland is particularly rich, and it is expected that the opportunity of examining these samples will be of advantage to those who are concerned in the many large building schemes now in progress in London and elsewhere. The beauty and excellence of the Irish granites, sandstones and limestones, as well as of the red, green and black marble and other ornamental stones of the country, are well known, and when shown at the Imperial Institute excited the admiration of all who saw them. The Department have taken steps to place the fullest information at the disposal of enquirers.

The National Opalite Glazed Brick and Tile Syndicate, Ltd.

The highly decorative character of the patent Opalite tiling is seen to great advantage at the stand of Mr. William Griffiths, London concessionaire of the above company, of 41, Hamilton House, Bishopsgate Street Without, E.C. (at special position No. 1, row A). The beautifully polished surfaces, with their various handsome tints, form a most attractive display. In these well-known tiles the old glaze is superseded by a superior and cheaper process, which can be readily applied. The high polish and consequent great reflective power of the surface is not affected in any way by the fixing of the tiles, which have granulated backs (Shelmerdine's patent) fluxed on to them, thus ensuring a secure key. The glaze is practically imperishable, it does not lose its lustre or become patchy when exposed to damp, and is not affected in any way by extremes of temperature. Opalite is therefore confidently recommended for use in bathrooms and lavatories, whilst its uniform distribution of reflected light (and it is claimed that its reflecting power is far superior to that of any other glazing material) renders it very valuable for subways, passages, basements and in other situations where the best possible absorption of light is necessary. Opalite can be applied to old or new brickwork; the advantages of having walls glazed after the brickwork is finished are strongly urged, so that a close joint may be secured and a heavy waste in breakages avoided. It is also claimed that Opalite, which is made in a variety of tints, is much cheaper than ordinary systems of glazing, and is much more easily and cheaply repaired when damaged by accident or hard usage. The material has now stood the test of years, and has given full satisfaction as applied in such important buildings as Windsor Castle, the Stock Exchange, the Bank of England, the Carlton Club, and several hospitals under the Metropolitan Asylums Board, as well as the London County Council. Opalite has been awarded a prize medal by the Sanitary Institute of Great Britain.

The London Fireproof Plate Wall Co., Ltd.

The London Fireproof Plate Wall Co., Ltd., of 60, Watling Street, E.C., show their system of wall construction at stand No. 56, row C. A wall on this system is constructed of plates of gypsum jointed together by intersected passages. In the middle of each plate or slab there is a vertical through passage, and on each side a number of air chambers, which, however, do not pass through the whole height of the plate. Horizontally the plates are jointed together by fillets and grooves. As each row is placed in position the plates are jointed with cement, and liquid cement is poured down the vertical passages, filling up those which are open, ascending those which are closed (as far as the compressed air allows) and filling up the horizontal joints in their entire length. This is continued course by course until the wall is completed and formed into one sheet as though cast in a large mould; extraordinary strength is given to the wall by the cement columns formed in the whole of its height. The air-chambers in the plates are quite impervious to sound, and act as non-conductors of heat, besides tending considerably to reduce the weight of the walls. As an instance of the size of walls which can be erected may be mentioned three which have recently been completed in the first floor of a board school at Todmorden. Two of these walls were 20ft. long by 21ft. high and one 31ft. long by 19ft. high. These walls, which were built on the first floors, did not require any additional supports, and were finished in a week. The surface for about 4ft. deep, and the length of each wall, was prepared for use as blackboards. (Walls have been erected in Berlin 58ft. long and 41ft. high.) For the purpose of giving extra stability to the walls, or where larger walls than those mentioned are required, iron tubes or rods are cemented into the vertical passages throughout the whole height of the wall. Double walls can also be formed suspended from a beam built into the main walls, thus taking the whole of the weight off the floor.

John Bennett Lawes & Co., Ltd.

At stand 38, row B, Messrs. John Bennett Lawes & Co., Ltd., of Atlas Works, West Ferry Road, Millwall, E., show specimen work in "Gypo" fire-resisting plaster and "Lawes'" Keene's cement. Girders and columns are encased in "Gypo" plaster, and also with Portland cement as well. Galvanized corrugated sheet-iron partitions are shown covered in "Gypo" plaster, with sections painted and papered. All "Gypo" work on iron is placed direct on to the surface of the metal without the aid of any key whatever. This firm has just completed covering 50,000 sq. ft. of iron columns with "Gypo" fire-resisting plaster 1in. thick, covered with Portland cement and sand 1in. thick, at Millwall Dock Granary — replacing the 4in. concrete usually adopted and saving the cost of metallic lathing, cradles, &c. Mack's fireproof partition slabs are also exhibited covered with "Gypo" polished, mouldings and cornices in "Lawes'" Keene's cement, and other specimens of "Gypo" work.

The London Basalt Stone Co.

The London Basalt Stone Co., Ltd., 45, Parliament Street, S.W., exhibit in galley bay No. 25 specimens of their celebrated Rhenish basalt macadam in all sizes, and basalt columns; also lava setts and large patent concrete conduits — the company makes conduits up to 7ft. in diameter in circular form, and in egg-shape 7ft. high. They are also exhibiting non-slippery pavement, kerbing and channelling. The latter has iron tees running longitudinally through it, which greatly increases the strength. The top face of the kerbing is bevelled to suit the fall of the pavement. The company have also on their stand specimens of Trass, another volcanic product used in addition to cement for the purpose of increasing its strength; also pumice bricks.

Silicate-of-Lime Stone, Ltd.

Samples of the new silicate-of-lime stone, the invention of Mr. R. P. Ford, and manufactured by Messrs. The Silicate-of-Lime Stone, Ltd., of 32, Victoria Street, S.W., are exhibited at stand No. 54, row C. The samples show the stone to look exactly like natural stone, except they are more even in colour and texture. Examples of carving are shown which prove that the stone is most even in working, and we are assured that the great defects to which all artificial stone made with lime by the application of superheated steam is liable – namely, the silication not being equally effected in every part, especially in the interior of the block, soft pockets being found—have been overcome by means of most expensive machinery. The variations in colour from a clear white to a warm cream or pink are obtained by using various coloured sands. Very large blocks have been obtained, one of the greatest difficulties in former attempts at this class of stone, some being as large as 6ft. by 3ft. The claims upon which the utility of this stone are based are briefly that it resists weather better than the natural stones, Bath and Portland, is even in colour and texture, and has a greater crushing strain. With regard to cost, it is stated the stone can be produced for about 4d. per foot cube, and sold for about 10d. as against 11d. for Bath and 1s. 6d. for Portland stone. The labour of working is about equal to Portland. Tests as to its strength show it about three times that of Portland, and it resists the action of acids better than Portland or Bath.

New Expanded Metal Co., Ltd.

The stand (special position No. 7, row D) of Messrs. The New Expanded Metal Co., Ltd., of York Mansion, York Street, Westminster, is one of the most striking in the hall. It is plain, and gains its effect from the pleasing proportion and feeling of style. The structure has a concrete floor 13ft. 6in. clear span, having expanded steel tension bond, built 3in. off the ground so as to show the method of temporary centering employed in practical working. A strip of the metal tension bond is left exposed throughout the length of the floor so that anyone can see the form of construction. On two sides of the structure is shown 2in. solid partitioning with window and door details, expanded steel and brass panels being substituted in the latter, in place of the usual wooden panels. The other two sides are enclosed with expanded steel verandah railings. There are also shown the expanding steel lathing and plaster encasing of girders and stanchions, false columns formed of expanded steel lathing and plaster, panelled ceilings, suspended ceilings, coving and false beams of expanded steel and plaster. Altogether this structure shows the many and various purposes to which this metal lathing is adapted, and the particular means employed in practice far better than any number of drawings could do. All observers will at once comprehend the system. An attractive feature of the exhibit are the sky signs of expanded steel around the top of the structure.

Mr. W. E. Farrer, of 36, Cannon Street, Birmingham, exhibits at stand No. 17, gallery bay, automatic alternative distributing apparatus for small bacteria beds (such as are required for asylums, barracks, &c.). The apparatus is simple and ensures the whole bed being successively sprayed with well aërated sewage. "Torfit" urinals are also exhibited.

Messrs. Burn Brothers, 23 & 24 Charing Cross, S.W., occupy stand No. 35, row D, gallery. Here they show numerous varieties of drain pipes and fittings, stoppers, inspection mirrors, brass and lead traps, tidal valves, sinks with anti-flooding overflow, &c.

Cresswell's patent "Vorticone" inlet and extract ventilators, in terra-cotta and metal, are shown at stand No. 13 in the minor hall by the Vorticone Ventilator Co., 77, Victoria Street, Grimsby.

Mr. George Riches, Church Street, Cromer (stand No. 20 in the minor hall), shows specimens of his bricks—red facings, red moulded and other varieties. A speciality is made of gauged work.

At stands Nos. 17 & 18, row D, gallery, Messrs. Askham Brothers and Wilson, Ltd., Yorkshire Steel and Engineering Works, Sheffield, exhibit spring rail points, &c.

Messrs. W. Salter & Co., 587 & 589, Harrow Road, Kensal Green, W., occupy stand No. 39, row D, gallery, where they exhibit asphalt for roofs, paving, &c.

Messrs. J. Halden & Co., 8, Albert Square, Manchester, exhibit electric copying frames and other apparatus for engineering photography—black line prints and blue prints (stand No. 106, row F).

The Horsham Engineering Works, Horsham, Sussex, exhibit at stand No. 9, bay, the "Vulcan" elevating pug mill, which has an elevator fixed on the delivery, the clay being thus carried by a worm on to the table in four separate lots, ready for four makers.

Messrs. Babcock & Wilcox, Ltd., of Oriel House, 30, Farringdon Avenue, E.C., show models of their patent water-tube steam boiler fitted with steam superheater (first introduced in 1867, but since much modified); of their mechanical chain-grate stoker; of their water softener and heater; as well as specimens of steel piping, and a tube cleaner operated by water power or air-pressure (stand No. 7, bay).

The Granite Silicon Plaster Co., Ltd., 36, King's Road, St Pancras, N.W., occupy stand No. 40, row B, where they exhibit their plaster, which has been largely used by the War Office and Post Office, as well as in many public buildings, hospitals, asylums, &c. Work in this plaster can be commenced and finished in one day; so that it is really cheaper than ordinary mortar plaster, although the first cost is somewhat more.

Messrs. J. C. Broadbent & Co., Ltd., 73, Basinghall Street, E.C. (works at Redcar and Hazlehead), exhibit slag wool at stand No. 42, row B. The material is the best for pugging, sound-deadening and non-conducting purposes.

Moule's patent earth-closets—which are admirably handy where there is no water-carriage system—are shown at stand No. 47A, row B. The offices of the company are at 5A, Garrick Street, W.C.

Messrs. D. Anderson & Son, Ltd., of Finsbury Pavement House, E.C., Lagan Works, Belfast, and at Manchester and Glasgow, show their "Stoniflex" roofing and other felts, as well as silicate cotton in various forms, and Anderson's patent hair fabric for covering pipes, &c. The firm's stand is No. 60, row C.

Velvril paint is shown by the Velvril Co., Ltd., 29 New Bridge Street, E.C. (stand No. 67, row C). This paint contains no lead or linseed oil, is easy to work, quick drying, gives a hard smooth surface, is perfectly waterproof and non-corrosive. It is suitable for use on iron, steel, wood, cement, &c.

Messrs. Hall & Co., Croydon, Ltd., Victoria Wharf, Croydon, occupy stand No. 79, row D, where they show varieties of slates and tiles. Precelly best randoms were used on the Royal School of Art Needlework, South Kensington. Precelly rustics make a pleasing roof particularly suited to country houses and mansions. Precelly best peggies are small slates for turrets and Mansard roofs. Buttermere, Elterwater, Bettws-y-Coed, Bangor, Carnarvon and Portmadoc slates are also supplied by this firm.

Messrs. H. J. & C. Major, Ltd., of the Patent Tile Works, Bridgwater, exhibit tiles of various kinds at stand No. 94, row E—roofing tiles, ridge tiles, malt-kiln tiles, baker's-oven tiles, &c.

High-class joinery is a speciality of Messrs. Samuel Elliott & Sons, Ltd., of Caversham, Reading, who exhibit at stand No. 97, row E. They are also the patentees and manufacturers of Elliott's patent "Perfect Simplex" weather-bar for casements opening inside.

The South Lincolnshire Brick and Tile Co., Ltd., Bourne, exhibit specimens of red facing pressed and wire-cut bricks, red facing sand-faced bricks, tiles, ridges, string-courses and finials at stand No. 117, row F.

The Wood Carving Co., Ltd., of Windsor Street, Birmingham (stand No. 64, row C), show Saracenic and patent fitments, carved balusters, newels, overdoors, pressed and plain hardwood mouldings, finger plates and lock furniture. Special attention is given to the finish of the work done by this firm.

Messrs. J. B. Stone & Co., Chiswell House 135, Finsbury Pavement, E.C., who occupy stand No. 148, wall space, exhibit their chain-saw mortising machine, door and sash clamping machine, sash relishing and mortising machine, pocket-cutting and window frame machine, as well as a moulding sander, trimmers, saw benches, band-saw and other machines.

Ripolin paints are shown on stand No. 3, bay, by Messrs. Ripolin, Ltd., Dominion House, 110, Fenchurch Street, E.C. One coat of gloss Ripolin is claimed to be equal to one coat of the best white lead and one of varnish. Ripolin flat is a washable flat enamel. Both are suitable for interior and exterior work.

At stand No. 5, bay, Messrs. Moffatt & Eastmead, of Green Street Engineering Works, Blackfriars, S.E., exhibit their patent self-sustained belt-power elevators and hand-power lifts, "Delta Despatch" sack lifts, their patent self-sustaining crab and Moffatt's feed-water heater.

Messrs. L. Lewis & Co., of 51, Shirland Road, W., at stand No. 16, row A, show their flexible mastic damp-course, patent flexible mastic roofing and slaters' felts.

Messrs. Meldrum Brothers, Ltd., 66, Victoria Street, S.W., exhibit several models at their stand (No. 5, B and C row). These are of their simplex regenerative refuse-destructor, of Fielding & Platt's hydraulic flag press, and of the Brunn Loewner water softener. A unique collection of curios from destructors is also shown.

ELECTRIC-LIGHT STATIONS.*

THEIR DESIGN AND ARRANGEMENT.

By Mr. ERNEST R. MATTHEWS, C.E., F.G.S., Borough Engineer of Bridlington.

MR. MATTHEWS gave a detailed description of the various points necessary to be observed in designing an electric-light station, illustrating his remarks by drawings of the proposed Bridlington electric-light station, which he had designed and which was about to be carried out. He first dealt with the engine-house, and pointed out that it was a great mistake to cramp up the building, that the floor area should be full and sufficient, and that ample space should be left not only between each engine but also adjoining each wall of the engine-house. He then referred to the necessity of making provision for future extensions by building a temporary end. He stated that plenty of head-room was necessary in order that the overhead crane could run to and fro with perfect freedom. The walls, he considered, should be built in cement-mortar, and should be calculated to withstand not only the strains due to the overhead crane and the thrust of the roof, but also the vibration set up by the engines. Piers built in cement should support the girders or arches carrying the overhead traveller. He stated that it was a most decided advantage to have the walls of an engine-house lined with glazed bricks, and he described such a method which he had adopted in the Bridlington engine-house. He considered that a 10-ton crane, worked by hand from the floor by ropes, was quite sufficient for a small station. Plenty of light was necessary, and he recommended that one-seventh of the roof surface should be skylight and about one-sixth of the total wall-area windows. Ample ventilation should be provided, chiefly by means of hopper ventilators in the windows, and by means of the glazed roof-ventilators.

The engine bed would vary from 5ft. to 20ft. in thickness, according to the type and weight of the engine. The floor might with advantage be paved with red Staffordshire encaustic tiles, laid herring-bone fashion on 6in. or 9in. of concrete, the cover plates of the trenches being filled in to match the floor. A convenient size for the trenches, he thought, was 2ft. 6in. wide by 2ft. deep. The drains should have manholes at intervals; the roof should be supported by light steel roof-trusses; brackets should be inserted in the walls to carry pipes, and there should be a pair of broad doors, running on rollers at the temporary end.

The floor area of the boiler-house would depend on the number, size and type of boilers. The Bridlington boiler-house measured 63ft. by 33ft. 6in., and it accommodated two Lancashire boilers, each 7ft. 6in. diameter and 30ft. in length. In calculating the weight of the boilers for foundation purposes it was necessary to include water and fittings. Concrete 2ft. in thickness should be sufficient. Provision should be made for future extensions by building one side of the boiler-house in a temporary manner. The height might with advantage be from 24ft. to 30ft., and the floor should be sunk several feet.

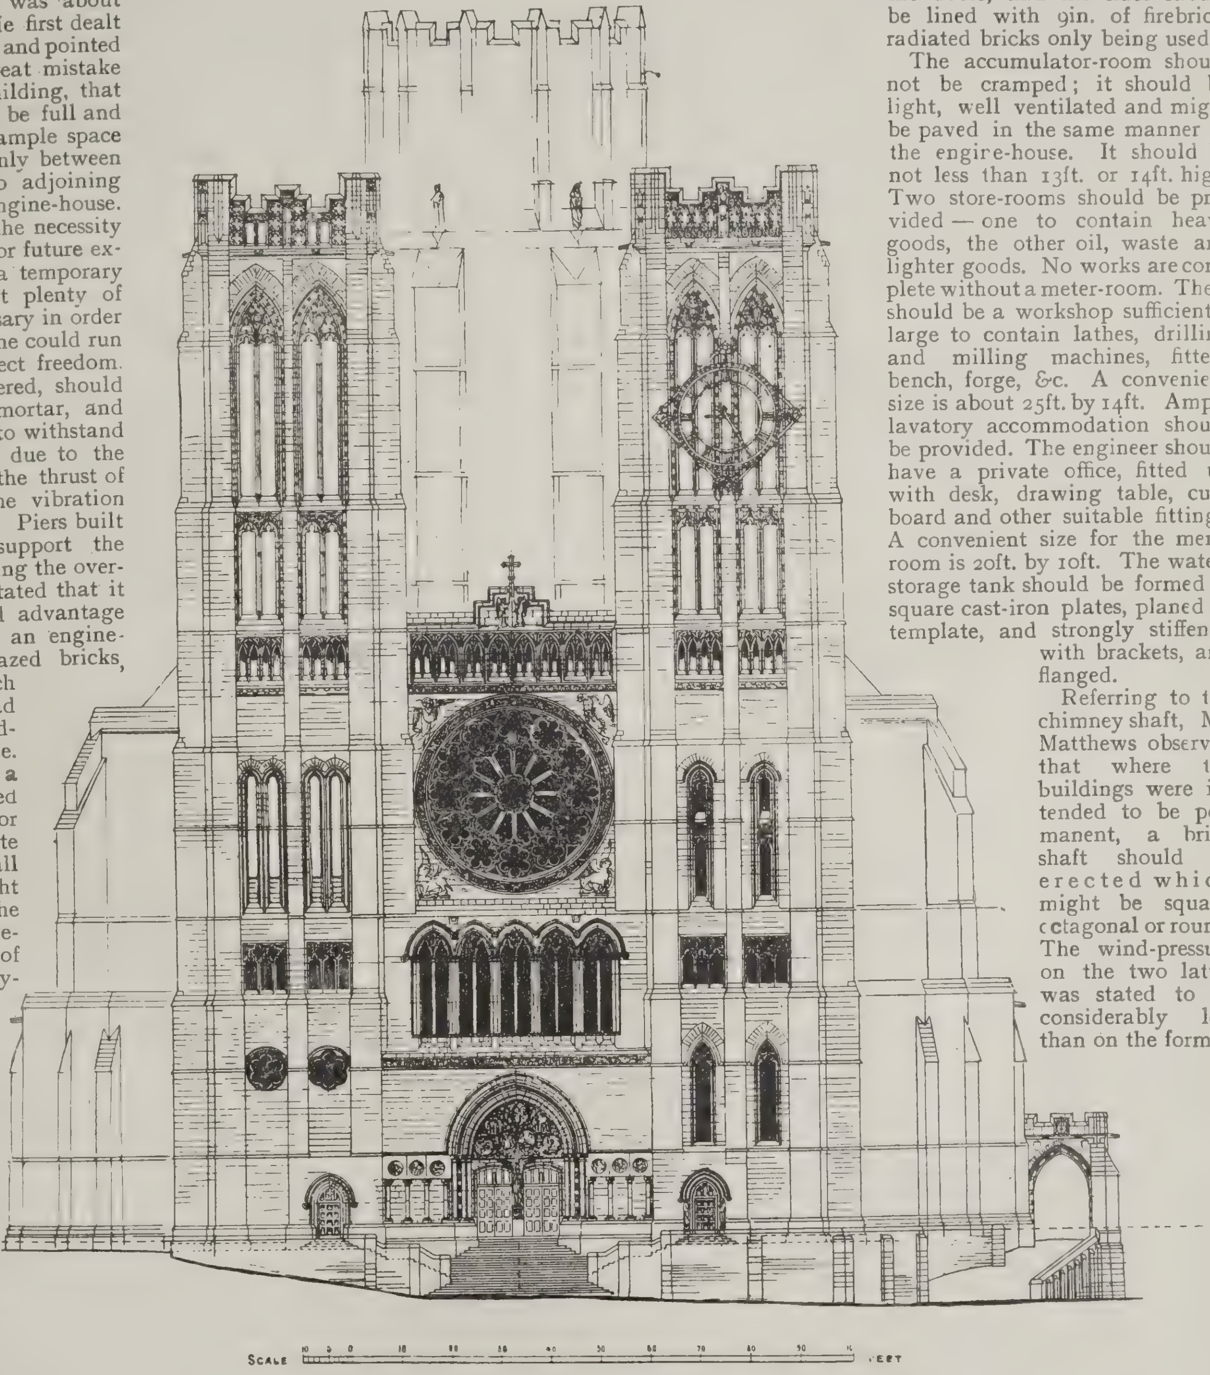
The walls should be built in cement-mortar, and plenty of light should be provided by means of a number of large windows placed on the permanent side, and about one-fourth of the roof covered with patent glazing. The ventilation might be by means of hopper ventilators in the windows and louvre ventilators in the roof. The floor might with advantage be paved with flags on 6in. or 9in. of concrete, and the trenches should be covered with wrought-iron checker plates.

The roof should be supported by steel roof-trusses, and should be close-boarded. Drainage for the scum and blow-off cocks, water-gauge cocks, &c., should be provided. The coal bunker should be placedas near to the furnaces as possible, and an inclined footway should lead to the boiler-house for the purpose of wheeling ashes out. Care should be taken in the arrangement of the doors, and the flues should be lined with 9in. of firebrick, radiated bricks only being used.

The accumulator-room should not be cramped; it should be light, well ventilated and might be paved in the same manner as the engine-house. It should be not less than 13ft. or 14ft. high. Two store-rooms should be provided — one to contain heavy goods, the other oil, waste and lighter goods. No works are complete without a meter-room. There should be a workshop sufficiently large to contain lathes, drilling and milling machines, fitters' bench, forge, &c. A convenient size is about 25ft. by 14ft. Ample lavatory accommodation should be provided. The engineer should have a private office, fitted up with desk, drawing table, cupboard and other suitable fittings. A convenient size for the men's room is 20ft. by 10ft. The water-storage tank should be formed of square cast-iron plates, planed to template, and strongly stiffened with brackets, and flanged.

Referring to the chimney shaft, Mr. Matthews observed that where the buildings were intended to be permanent, a brick shaft should be erected which might be square, octagonal or round. The wind-pressure on the two latter was stated to be considerably less than on the former, the relative pressures being:—Square, 1·0; octagonal, 0·65; round 0·5. The external width of the shaft at the base should be, if square, one-tenth of its height; if octagonal one-eleventh, and if circular one-twelfth.

Mr. Matthews then dealt with the foundation, observing that, given a good clay foundation, a chimney 150ft. high might stand on a good bed of Portland-cement concrete (5 or 6 to 1) 20ft. or 22ft. square by 7ft. or 8ft. thick. The concrete should remain three weeks before any brickwork is



DESIGN FOR LIVERPOOL CATHEDRAL BY C. A. NICHOLSON: ELEVATION TOWARDS UPPER DUKE STREET.

---

* Summary of a paper read before the Society of Engineers on June 8th, 1903.

placed upon it, and all the bricks should be of the same density.

He then dealt with the thickness of the brickwork, also the bond, which should be one course of headers to three or four courses of stretchers. The mortar, he said, should be lime-mortar and not cement-mortar, which was too rigid. The brickwork should proceed slowly, say 3ft. or 4ft. per day. He said the cap might be of iron, terra-cotta, or stone, and should not project more than the thickness of the brickwork. The shaft should be lined to a height of at least 30ft. for ordinary heats with a firebrick lining. The lightning conductor should not be carried around projections, but through them. The author then gave particulars of how the lightning conductor should be fixed; also as to how the inside diameter or area of a flue should be determined, and as to the height of a shaft.

Mr. Matthews stated that the tender of Messrs. G. Storr & Son, contractors, of Bridlington, for the buildings had been accepted, the contract amount being £5,283. The consulting electrical engineer is Mr. J. H. Medhurst, B.Sc., M.I.E.E., of Westminster, and the total estimated cost of the works is £26,000.

Correspondence.

The West Front of Wells.

To the Editor of THE BUILDERS' JOURNAL.

LONDON.

SIR,—In a study I have lately made of the images on the west front of Exeter Cathedral it has been shown that the scheme figured the Coronation of the Virgin, the central subject being surrounded by apostles, prophets, the royal ancestors of the Virgin and rejoicing angels. It is natural to turn from Exeter to the more glorious image wall of Wells. Here, since Cockerell wrote, it has been the custom to interpret the fine series of kings, bishops and deacons as English kings and clergy of local interest. Following the critical study which in France has been given to cathedral iconography, I hold it for certain that the whole of the sculptures must be explained by reference to the Bible and the Calendar of Saints.

At the apex of the gable is Christ in majesty; directly below, in two tiers, are the twelve apostles and the nine orders of angels (these two last are comparatively late sculptures). The next row beneath is filled with a series of small subjects representing the resurrection of the dead. Then come two great tiers of statues, mostly kings and bishops. A row of small Bible histories follows, and a series of angels holding crowns, mitres, books, scrolls, &c., in quatrefoil panels. Beneath these again was another tier of statues, but these are mostly lost. In the tympanum of the west door is the Virgin and Child, with two censing angels, and above in a large central niche is a lovely coronation of the Virgin. In the last the figures of Christ and the Virgin are about life-size and of remarkable beauty. His foot is on a lion; hers seems to have rested on a serpent. This group is certainly the centre of interest of the whole front, and the meaning of the rest of the sculptures must be sought in relation to it; so much at least the Wells front has in common with Exeter—it celebrates the triumph of the Virgin.

There are few other clear data for founding a sure theory for the interpretation of this great scheme of sculpture.

The leading facts are that—

(*a*) To the north of the central axis there are a great many kings and knights, and to the south a great many bishops. There are one or two interchanges, but, generally, we may speak of the side of the kings and the side of the bishops. (It is said that Arabic numbers have been found on some of the statues, and this may point to shifting at some time.)

(*b*) Here and there are figures of martyrs and saints.

(*c*) William of Worcester, writing about 1450, says that the rows of great images of the west front and south return treated of the "New Law" and that the north return represented the Old Law. In these small Bible story panels, the north half is devoted to the New Testament and the south half to the Old Testament, but it is at least evident that William described carefully from personal observation, and that he was told nothing about English kings.

(*d*) The kings are figured trampling on smaller figures of knights and kings, some with their arms bound, and most expressing rebellion and rage. In several cases it is clear that the kings carried swords or sceptres and other objects. One holds a large shallow cup, or rather a dish on a stem, and in a second case the foot of a cup remains. The king just above the coronation of the Virgin is said to have held a building. One of the figures holds his tunic aside so as to show a curious plate over his thigh. This is evidently applied above an under-garment like a piece of armour for the protection of the thigh, possibly of leather. Following the analogy of other cathedrals one might expect that the kings would represent the royal ancestors of the Virgin, but there are several difficulties in the way of this explanation, the foremost being the manner in which the kings are balanced by priests as above described. It seemed possible that these priests might represent the priestly line of the Virgin's descent as given in St. Luke, but it is difficult to suppose that priests of the Old Law would be represented as bishops. The royal ancestry theory would, however, well explain the king and queen who stand directly above the Coronation group. This king held a building, and would thus be Solomon, as in the east window of the same church; moreover, Solomon and Bathsheba are proper Old Testament types to accompany representations of the coronation of the Virgin. They are found together in the Biblia Pauperum, and are so painted in the glass at King's College. On the Old Testament theory the figure showing his thigh might be Jacob, and one with a cup, Melchizedech.

It is possible to suppose that the kings and knights on one hand were the ancestors of Christ and other Old Testament worthies, and that the bishops and other priests were the descendants in spirit under the New Law. This furnishes a general idea, such as we must suppose would have ruled in a great work of art. And it agrees with William of Worcester's antithesis between the Old Law and the New. Arguments against it are the difficulty of supporting such an interpretation by examples in other places; and the interchange between a few of the churchmen and laymen. It is possible that the only scheme was to have saints and martyrs broadly divided into religious and secular in their several ranks of life—popes, bishops, deacons, abbesses; kings, queens, knights. That some correspondence as between "kings and priests" was intended seems to be made evident by the angels in the quatrefoils who carry crowns and mitres.

The only way of proceeding further will be by making individual identifications, and to this end I propose the following. The figure standing in water and carrying two children must be St. Eustach; it cannot be St. Nicholas, who was a bishop, nor St. Christopher, who should only have one child. St. Eustach was very popular, and a large wall-painting is devoted to his story in Canterbury Cathedral. The king and queen over the coronation of the Virgin are Solomon and Bathsheba, not Ina and his queen. There is no difficulty in supposing that this pair of figures are pendants to the Virgin's coronation, even though the other kings are not Biblical. The series of deacons in the north tower are probably Stephen, Vincent Lawrence and other popular deacon-martyrs. These took a first place amongst the great saints of Christendom. The bishop carrying the crown of his head in his hands may be St. Denis, although he is usually figured carrying his mitred head. Can it be St. Thomas of Canterbury? It is difficult to think that he would not be present in a group of sainted churchmen, and according to some accounts the top of his head was cut off. One or more of the ecclesiastics have tall conical mitres: such a tiara marks a pope. An old illustration of one of the figures shows a bishop carrying a stone; if this representation was correct, he was probably, as suggested in Parker's calendar, St. Elphage.

The images were painted throughout on a systematic plan, as may be seen from vestiges which here and there give evidence to careful examination. Indeed, it is the colour-skin of ochre still adhering to the heads of most of the statues which has preserved them in so marvellous a way for seven hundred years. The splendid group of the coronation of the Virgin has its ground coat nearly intact all over, and this would have been highly illuminated. The ground of the niche in which the figures are seated is drilled with many holes, which we may suppose bore gilt metal stars on an azure ground. The central door below still shows strong red on the roll mouldings and bright blue here and there in the quatrefoil which contains the Virgin and Child. The row of niches in the central bay on either hand of the coronation group had their recesses of deep red. The angels in the row of quatrefoils have in several cases the ground colour of yellow ochre all over, and the same may be found in places on the Bible story series. The tree in the baptism panel also shows the ochre clearly. The panel of Christ disputing with the Doctors is particularly interesting as still showing decorative detail added in painting. The wall of the Temple is carried out in red, "masoned" as it was called, and its cornice has scroll leafage painted on it in black.

I have spoken above of the heads of the large standing statues being coloured in ochre; this smooths the texture of the stone, so that it takes up reflected lights; but this is not all, for in two or three cases it is still evident that the hair and eyebrows were black and the lips were coloured red (the foundation colour of ochre we find on other early figures—those on the choir screen at Salisbury, for instance). Here and there patterns were doubtless added as borders and diapers to the robes, and portions were touched with gold, as the little building in the hand of the king above the coronation group, which, according to Cockerell, was gilt.

The central door with the coronation of the Virgin above it must have been splendid in bright colour. Sixty years ago Cockerell saw vestiges of gold on the figures and mouldings of the doorway; the ground was ultramarine, the mouldings gold and red, the figures partly gilt. This colour must have been echoed in the ranks of saints round about, and the heads of the statues must have shone out under the canopies like carved and painted ivory.—Yours truly,

W. R. LETHABY.

Devon and Exeter Architectural Society.—The "Proceedings" of this Society for 1902–03, just issued, include, among other matters, some notes on architecture in Switzerland, with sketches, by Mr. Harbottle Reed. The statement of account shows a balance in hand of £20.

R.I.B.A.

New Council, Committee and Members.

At the last meeting of the Royal Institute of British Architects the following elections were made for 1903-4:—

President.

Aston Webb.

Vice-presidents.

John Belcher.
T. E. Collcutt.
A. Darbyshire.
J. Slater.

Council.

F. T. Baggallay.
C. E. Bateman.
G. F. Bodley.
J. J. Burnet.
A. W. S. Cross.
Ernest George.
J. S. Gibson.
J. A. Gotch.
E. T. Hall.
C. H. Heathcote.
Arnold Mitchell.
E. W. Mountford.
Beresford Pite.
G. H. Fellowes Prynne.
S. B. Russell
W. H. Seth-Smith.
J. W. Simpson.
Leonard Stokes.

[Not elected:—A. C. Blomfield, W. D. Caröe, H. O. Cresswell, F. R. Farrow, W. M. Fawcett, W. Flockhart, G. E. Grayson, E. A. Gruning, J. Douglass Matthews, F. L. Pearson, S. P. Pick, H. H. Statham, C. Harrison Townsend, Silvanus Trevail, Paul Waterhouse and R. S. Wornum.]

Associate Members of Council.

V. S. Balfour.
H. V. Lanchester.
W. J. N. Millard.
E. W. Wimperis.

[Not elected:—A. T. Bolton and H. W. Wills.]

Representatives of Allied Societies.

G. C. Ashlin (R.I.A. of Ireland).
J. W. Beaumont (Manchester)
A. W. Brewill (Nottingham).
H. K. Bromhead (Glasgow Institute).
A. H. Crawford (Edinburgh).
Arthur Harrison (Birmingham).
Butler Wilson (Leeds and Yorkshire).
Joseph Wood (Bristol).
J. Woolfall (Liverpool).

[Not elected:—A. Clyne (Aberdeen), D. Morgan (Cardiff), J. W. Taylor (Newcastle) and A. Waverley (Leicester).]

Representative of the Architectural Association.

H. T. Hare.

Auditors.

L. Ambler.
W. A. Forsyth.

Art Standing Committee.

The following alterations in the schedule of conditions of contract, about which negotiations with the Institute of Builders had been made, were adopted:—As printed on p. 319 of the "Kalender," line 3, for "said" read "signed"; lines 4 and 5, for "and instructions in explanation of the same" read "instructions, directions and explanations"; line 9, for "in excess of" read "extra to"; line 12, for "excess" read "extra." The following clause, for use where quantities are part of the contract, was also adopted:—12A. Should any error appear in the bills of quantities other than in the contractors' prices and calculations, it shall be rectified, and such rectification shall constitute a variation of the contract, and shall be dealt with as hereinafter provided.

NEW RESERVOIRS.

On Thursday, May 28th, the members of the Junior Institution of Engineers, by permission and under the personal guidance of the engineer, Mr. Joseph Francis, M.I.C.E., visited the Staines reservoirs communication works of the New River Company, special arrangements for their reception having been kindly made by the contractors, Messrs. John Aird & Sons, of whom Mr. Basil P. Ellis was present. The intake is formed at the side of the Staines reservoirs aqueduct, and is furnished with an automatic gauge for measuring the quantity of water received. Thence the water will flow into a suction tank having a capacity of 1,000,000 gals., from which it will be pumped to a height of 24ft. into two subsiding reservoirs having a joint capacity of 300,000,000 gals. and a total area of 62 acres, the depth of water in each being 20ft. The embankment of the reservoirs will be of earth, with clay puddle walls in the middle, carried down to the London clay that underlies the site. From the reservoirs the water will flow through lines of 42in. pipes to the filter beds, first passing through tanks provided with float-valves to retain the water surface in the beds at a fixed level. There will be twelve filter beds, each of an area of three-quarters of an acre. The filtered water will be pumped through a 42in. main, $13\frac{1}{2}$ miles in length, to Cricklewood, where it will be again pumped through a main $3\frac{3}{4}$ miles in length to a service reservoir at Fortis Green, Finchley, at a level of 298ft. above O.D. The engine-house will contain two first lift engines, three second lift engines, auxiliary engines and eight boilers. There will be in connection therewith an octagonal chimney-shaft 135ft. in height. Six sand-washing apparatus will be provided, and settling tanks and coke filters for treating the effluent water from the sand-washing, before its delivery through a line of pipe, 2 miles in length, into the River Thames. There will also be provided coal stores, offices, a fitting and other shops, stores, stabling, a residence for the manager and cottages for workmen. From the adjoining railway a siding will be formed for the conveyance of coals, sand, castings and other material required. The Act of Parliament authorising the construction of the above-mentioned and other works, at a cost of £1,000,000, was obtained in the year 1897. Notable features of the inspection included the colossal engine-house; the processes in the formation of the puddle walls for the reservoirs; the ingenious gravel-washing apparatus; puddle-clay excavation by means of steam navvy; puddle-mixing machine; locomotives, wagons, &c., on the contractor's railway, of which there are ten miles laid. Mr. Samuel Cutler, Junr., M.I.M.E., the newly-elected vice-chairman of the Institution, proposed the vote of thanks.

BRICKMAKING IN AUSTRIA-HUNGARY

American Machinery and the Combination of Manufacturers.

The Board of Trade have received through the Foreign Office a copy of a memorandum, drawn up by the Commercial Attaché to H.M. Embassy at Vienna, relating to the introduction of American brickmaking machinery in Austria and to the combinations formed by brick manufacturers in both Austria and Hungary. According to this memorandum American brickmaking machinery was introduced into Austria in the year 1899 by the "Wienerberger Ziegelfabriks und Baugesellschaft," a company representing with its annual output of 200,000,000 bricks the biggest individual brickmaking industry in the world. Already in 1898 the company had decided on this step owing to the difficulty of obtaining sufficient labour for the manufacture of hand-made bricks, and also to the fact that the brick produced by the "stiff mud clay" process was not popular with consumers.

Many difficulties, however, had to be overcome before the American machinery intended for the production of the American standard brick of $8\frac{3}{4}$in. by $4\frac{1}{2}$in. by $2\frac{1}{2}$in. (222 by 108 by 64 millimetres) could be successfully adapted to the manufacture of the larger Austrian standard brick of 290 by 140 by 65 millimetres. Nevertheless, within a year these preliminary difficulties were overcome, and since 1899 two vertical machines from a firm at Cincinnati, Ohio, have been at work in the Wienerberger factory. In the following year the general director of the company, Dr. Emil Teirich, proceeded to America for the purpose of studying other kinds of brickmaking machinery in use in that country. As a result of these investigations the company introduced the horizontal machines of a firm at Wellington, Ohio, and improved upon them to such an extent that one of these machines is now capable of turning out 2,500 bricks—Austrian standard—per hour. During the last three years the construction of brickmaking machinery has been occupying the attention of Austrian machine manufacturers, and at the present time horizontal machines on the Wienerberger Co.'s system and vertical machines on Craeger & Son's system, and on the system of the Eastern Machinery Co., of Newhaven, Connecticut, are being turned out. Several brick factories in Austria have adopted this class of machinery, and it would seem as if Germany was going to follow suit, as during the present year two brickmaking machines have already been exported thither from Austria. An Austro-Hungarian Brick Trust does not exist. In the year 1900, however, nine of the principal manufacturers of Vienna and neighbourhood formed themselves into an association for the purpose of disposing of their production in ordinary wall bricks by means of a general sales bureau. After duly weighing the different possibilities of an organisation of this nature, it was finally decided that the Wienerberger Co. should undertake on commission the sale of the total production of the parties to the contract. The proceedings of this company, as commission agents to the Association, are controlled by a committee representing the different firms interested. The firm acting as commission agents receive, as compensation for its working expenses, $1\frac{1}{2}$ per cent. of the invoice value of the goods sold. After deduction of this commission, all profits, bad debts, &c, are shared *pro rata* by the Association. The committee decides what proportion of production should for the time being be allotted to each individual manufacturer in the Association, and fixes selling prices, credit facilities, &c., according to the requirements of the market. The factories, parties to the foregoing contract, are in a position to turn out annually about 400,000,000 bricks, Austrian standard. The Association was not founded for the purpose of raising prices, but with the object of reducing expenses and establishing fixed rules as to the method of payments; and from all reports it would seem that the system is working equally satisfactorily for both consumers and producers.

In Hungary a different arrangement has been made. With a view to the prevention of over-production, a joint stock company was formed at Budapest in 1899 for the sale of ordinary wall bricks. The company consists of sixteen factories, with a total annual output of about 420,000,000 bricks. The capital of the company is 1,000,000 crowns, divided into 1,000 shares of 1,000 crowns each, of which 30 per cent. is paid up. Owing to a "pooling" arrangement amongst the holders the shares are not on the market. The object of the organisation is the sale of all bricks produced by shareholders, whether hand- or machine-made, the granting of cash advances on stocks on the basis of a stipulated minimum price, and the regulation of production according to the requirements of the market. The direction of the company is entrusted to a council of fifteen members, and its supervision in detail to a committee of five. The improvement in prices anticipated by the company has, however, as yet, not been realized. This is partly to be attributed to the competition of five factories which have not joined the cartel and partly to a reduced demand owing to the depressed condition of the building trade in Hungary. The company's profits for 1900 were only 16,431 crowns and for 1901 28,833 crowns. No dividend has as yet been declared. Inasmuch as there is no export trade in bricks from the dual monarchy, no comparison between home and export prices can be made.

R.I.A.I.

Examination and Registration.

A SPECIAL general meeting of the Royal Institute of Architects of Ireland will be held at Dublin to-morrow to consider a report from the committee appointed to confer with ths Architectural Association of Ireland on the subject of qualifying examinations for admission to this Institute. The committee recommend that no one shall in future be eligible for admission to membership unless (in addition to the other qualifications set out in the by-laws) he has passed two examinations held by their Institute—a probationership examination (candidates for which to be not less than nineteen years of age and to furnish evidence of general education), and a membership examination for candidates who have already passed the probationership examination (such candidates to be not less than twenty-three years of age). The committee further recommended that an interval of at least one year should elapse between the passing of the two examinations; that the probationership examination should be chiefly theoretical and historical, and the other chiefly of a practical nature and dealing with professional practice; that a joint committee of the R.I.A.I. and of the A.A. of Ireland should be appointed to draw up a scheme of examinations and to frame a syllabus; and that the examiners should be appointed by the council, and the standard of the examinations for membership be equal to that adopted by the R.I.B.A. for associateship. It is also recommended that a candidate who has passed the latter examination should not be required to pass the examination of the R.I.A.I.; and that for a period of twelve months after the date of the first examination the council of the R.I.A.I. should have power to dispense with all examinations in the case of candidates who have been in practice as principals for not less than ten years.

The meeting will also consider the following notice of motion from Mr. W. T. Gilliland: "That the absence of restriction of the use of the title 'Architect' to those properly qualified to use same is a great injustice to architects who are so qualified, and seriously retards the progress of architecture in Great Britain and Ireland. That it is the duty of the Council of the Royal Institute of British Architects as representing the profession to make an immediate and serious effort to obtain statutory powers for the purpose of establishing such restriction."

Keystones.

In Charlton Kings Parish Church an oak screen has been placed in the south transept, and is a facsimile of the organ screen.

Cyfarthfa Castle, which has for some time been practically unoccupied, is being restored. The architect is Mr. Charles Morgan Davies, and the contractor Mr. John Jenkins.

The Drapers' Schools, Purley, have been enlarged in the addition of a new wing from designs by Mr. George Lethbridge, the architect. Messrs. Buckland & Waters, of Redhill, were the builders, their contract amounting to £4,375.

Change of Address.—Mr, Bertram Blount, consequent on the death of his partner, Mr. W. H. Stanger, has removed his chemical laboratory and testing works to 76–78, York Street, Westminster, where he will continue to practice under his own name.

A New Workhouse Infirmary at Bideford has been opened. It has cost £3,248, and accommodates thirty-eight patients. It is built of Marland bricks, with red-brick dressings. Messrs. R. T. Hookway & Son were the architects, and Messrs. Ellis & Sons the builders.

A new Wesleyan Church at West Kirby is being erected in Westbourne Road, at a cost of about £3,600. Messrs. John Wills & Sons, of Derby and London, are the architects. The design is Gothic, and the exterior facing will be local rock stone with ashlar dressings round the windows and doorways. Mr. Samuel Fowler, of Bootle, is the contractor.

New Central Public Baths at Bradford are being erected in Morley Street, and district baths in Drummond Road, Manningham. The cost of the Morley Street baths is about £34,000, and they have been designed by Mr. A. Hessell Tiltman, F.R.I.B.A., while the city architect (Mr. F. E. P. Edwards) is generally superintending the work.

A Housing Competition.—Messrs. A. B. M'Donald & P. Fyfe, Glasgow, the assessors in the competition invited by Hamilton Town Council for plans for the housing of the working classes, have made the following awards: 1st, R. W. Horne, A.R.I.B.A., 201, Kent Road, Glasgow; 2nd, W. Inglis, 102, Portland Place, Hamilton; 3rd, F. Southorn, architect and surveyor, 144, St. Vincent Street, Glasgow.

Stable Fittings.—Messrs. Hayward, Bros. & Eckstein, Ltd., of Union Street, Borough, London, S.E., have just secured the contract to supply all the stable fittings (for fifty-six stalls) for the Tottenham Urban District Council, new general depôt, The Green, Tottenham. Quite recently this firm has also supplied stable fittings to the Nottingham Corporation, Aston Manor District Council, and Bermondsey Borough Council, &c.

St. Mary's Parish Church, Whitechapel, was reopened recently after complete restoration. A sum of about £7,000 has been spent in repairing the church and in other works.

Dundee Institute of Architecture Sketching Club last week visited Pitkerro House, which has been recently restored and enlarged by Mr. R. S. Lorimer, A.R.S.A., architect, of Edinburgh. The company was shown over the old and new parts by Colonel Dick, the proprietor, and greatly admired the Scottish character of the work, special notice being taken of the plaster ceilings with their enrichments.

Liverpool Cathedral.—The general committee appointed by Mr. Bodley and Mr. Scott, the joint architects for the new cathedral, and have instructed them to prepare the plans with such modifications as they may think desirable; also to provide a morning chapel to seat 300, a chapter house, and more commodious vestries. They have also been requested to submit plans for the foundations for the chancel by October 1st next, so that the foundation stone might be laid during the Spring of next year.

The View from Richmond Hill.—At last week's meeting of the Richmond Town Council the alleged undertaking by Sir J. Whittaker Ellis to prevent building on the Buccleuch House grounds was considered. The parties concerned had now provisionally agreed to a modification of Sir Whittaker's letter containing the alleged undertaking by which one dwelling-house might be erected within a defined line on the back part of Cambridge Park Gardens, but the remainder and part of the Haversham Grange estate were to be protected from any further buildings, except observatories and others for garden purposes. This agreement was approved by the Town Council.

Views and Reviews.

Some Modern Drawings.

These are twelve drawings illustrative of the story of a woman and her child. They are essentially mystic, both in meaning and treatment, but are effective in their bold arrangement of blacks and whites. The best is that inserted in this issue "The Path to the Sun," whither the central figures of the story go. It will be seen from this inset that the reproduction of the drawing is admirably clear. The sheets are hand-made, and are enclosed in a portfolio of green cloth. Mr. Jephson is the well-known Surrey cricketer.

Twelve Drawings by Will G. Muir illustrating "A Fragment" by D. L. A. Jephson. London: R. J. Everett & Sons, 56 Ludgate Hill, E C. Price 7s. 6d. nett.

Obituary.

Mr. C. H. Cooksley, a well known Glamorgan builder and contractor, was accidentally cut to pieces by an express train at Llantrissant last Saturday week.

Mr. Harry Harper of Falkland House, Ballards Lane, Church End, Finchley, committed suicide last week by shooting himself. Deceased was the head of the firm of Harry Harper & Co., the well known builders, of Highgate and London.

Mr. Robert Walker, F.R.I.B.A.—We deeply regret to have to announce the decease at Windermere last Wednesday of Mr. Robert Walker, who had an extensive practice in the Lake District. Deceased was sixty-two years of age. He was elected a fellow of the Royal Institute of British Architects in 1893. Only last week we announced he had taken into partnership his son, Mr. Frank H. Walker, and Mr. James Carter, of Windermere, late of Darwen.

LONDON HOSPITAL.

The New Out-Patients' Department.

THIS important building, opened by their Majesties the King and Queen on Thursday last, takes the place of the old out-patients' department which occupied a part of the cramped, dark and badly-ventilated basement of the old west wing of the hospital. To form a site it was necessary to demolish forty houses. The building as completed is the largest of its kind in the United Kingdom, occupying nearly an acre of ground, but is only proportionate to the number of out-patients, 162,147 of whom were treated last year.

The building is entered from Oxford Street through a vestibule (capable of seating 200 patients) in which are the registration and ticket offices, at which new patients are registered and old cases receive their tickets. In the centre of the ground floor is a spacious waiting hall 105ft. by 55ft. and 40ft. high, having seating accommodation for 1,000 persons. It has an open steel roof with a lantern the whole length, in addition to large windows in the upper part. At the east end of the building there are two complete suites of rooms forming the surgical department. Each suite consists of a surgeon's room 28ft. by 19ft., clinical assistant's room, an operating room with a recovery room adjoining, two examining rooms, and on both male and female sides there are waiting-rooms for old and new cases with separate surgical dressing-rooms. At the west end is situated the medical department. This has also two suites of rooms, each of which consists of physician's room 30ft. by 19ft., clinical assistant's room, two examining-rooms, and waiting-rooms for both old and new cases for each sex. After receiving their prescriptions, the patients pass out through two waiting lobbies past the dispensary, and medicines, &c., are dispensed through eight hatches; the patients then leave the building by the exits into Green Street. This dispensary is connected with the laboratory in the basement by an electric lift and a separate staircase, and is completely fitted up in the most approved and modern style. A refreshment bar is attached to the waiting hall for the sale to the patients of light refreshments at nominal prices. Drinking fountains are provided both in the waiting hall and the vestibule. The general arrangement of the plan ensures that the patients after entering at Oxford Street are sorted, and then proceed through the department in which their case is dealt with, while after obtaining their medicine they leave by the exits into Green Street without crossing the progress of other patients. There are two private entrances from the street for the use of the staff and the officials. This out-patients' department is connected with the west wing of the hospital by a subway under Turner Street.

On the first floor are situated the aural, dental, obstetric and massage departments; all complete in themselves, having the necessary consulting-, operating- and waiting-rooms. The aural department at the east end has a consulting-room 60ft. by 19ft., fitted with thirteen tables, two operating-rooms with anæsthetising- and recovery-rooms, and a dark-room, together with male and female waiting-rooms. The dental department at the west end consists of extracting- and stopping-rooms with anæsthetising and recovery, teeth-cleaning and waiting-rooms. The obstetric department has two consulting-rooms, with dressing- and waiting-rooms. The massage-room has a waiting-room for each sex, and the staff sitting-rooms are also on this floor. The second floor is devoted to the ophthalmic, photographic and electrical departments. The ophthalmic department has rooms for surgeons and clinical assistants, large refraction- and dark-rooms, also an operating room with anæsthetising and recovery-room adjoining. There is a large photographic studio with two dark-rooms and workshop and store attached, also a separate room for radiography. The electrical department has a large consulting room with electric bath-room, Röntgen-ray room and dressing-rooms adjoining. The lupus department is also on this floor, and contains the "Finsen" lamp which her Majesty presented to the hospital, together with several other lamps. There are separate rooms for the surgical dressing of wounds, medical officer and nurses. The motor-generators and other apparata for transforming the electric current to supply this department are situated in a room on the roof above. These upper floors are approached by four staircases and two large lifts.

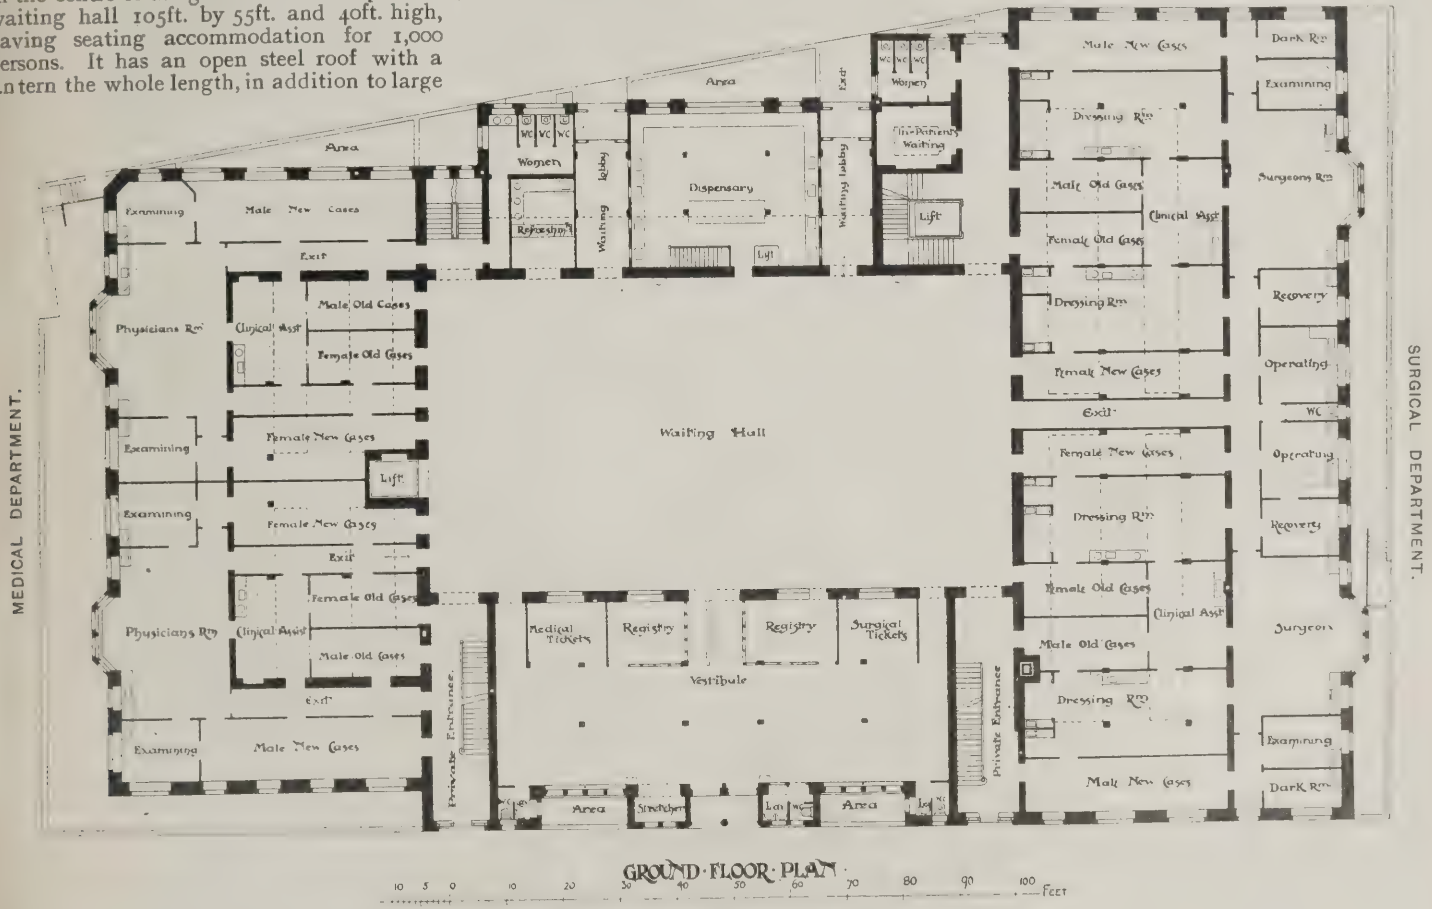
The basement contains a large laboratory department, with stores. The bath department consists of medicated and Turkish baths with the necessary dressing- and waiting-rooms, and is also in the basement, together with the boilers, isolation rooms and accommodation for students, dispensers, porters and other officials. The whole building is of fireproof construction, and the floors throughout finished with mosaic (by Messrs. Diespeker, Ltd.), and where necessary the walls are glazed with either glazed brick or Opalite; the remainder are finished with Serapite plaster.

The internal and external areas are faced with white-glazed bricks, and the external elevations are faced with red brick and artificial-stone dressings. The large waiting hall and principal rooms are ventilated by a system of inlet and forced outlet ventilation.

The total cost of the building has been £80,000, of which sum £25,000 was given by a friend of the hospital. The balance of £55,000 still remains to be collected.

The buildings have been erected from the designs and under the superintendence of Mr. Rowland Plumbe, F.R.I.B.A., of 13, Fitzroy Square, London, W. Mr. Henry J. Wagg, 15, Great George Street, acted as consulting electrician, Mr. William Shepherd being the builder and Mr. G. T. Murton the clerk of works.

At the opening ceremony Mr. Plumbe and Mr. A. F. Yarrow were presented to their Majesties by the Duke of Cambridge.



LONDON HOSPITAL, WHITECHAPEL: NEW OUT-PATIENTS' DEPARTMENT. ROWLAND PLUMBE, F.R.I.B.A., ARCHITECT.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Measuring Street Frontage.

REDDITCH.—P. M. writes: "In measuring the frontage to street on a building estate where the street is at a considerable angle, should such frontage be measured between perpendiculars or on the line of slope?"

Horizontal measurement between perpendiculars is correct. G. A. T. M.

Hollows in Brickwork: North and South Practice in Quantities.

BIRKENHEAD.—QUANTITIES writes: "In the North we usually include an item in our quantities of yds. super. forming hollows in brickwork reduced to the same standard thickness as the brick walls. This is the labour only in forming all openings for doors and windows, &c., the superficial area of the window or other openings being taken and reduced to the standard thickness in the same manner as the brickwork itself. Is this also the custom in London and the South, and, if not, what is the usual way of giving the labour in forming openings? I see no mention of it in the works on quantity surveying."

It is not the custom in London and the South to take an item for forming hollows in brickwork. Having had a good deal of experience of Northcountry-work, I have endeavoured at various times to discover the object of this item—the only justification for it, in the opinion of some of the builders asked (the others could give no opinion), being a labour to "plumbing jambs." While there may be something in this, the system of taking it in the same way as the brickwork seems most illogical—*e.g.*, an opening 4ft. by 6ft. in a 9in. wall gives 50 per cent. more of "plumbing jambs" than one 6ft. by 4ft. in an 18in. wall; yet in the latter case the builder gets twice as much in quantity when reduced to the standard thickness.

W. E. D.

Co-operative Building.

LITTLEHAMPTON.—STENOGRAPHER writes: "How is the profit-sharing principle (such as instituted by the Carnegie Steel Co.) applied to the building trade?"

Mr. Carnegie being a man of energy, whose business was his pleasure; having the special kind of clever organizing faculty; being autocratically in command, he could increase a salary or pay a bonus just as he deemed most effective for his purpose; in this way he worked up his big business until it became an organism with life in itself. The question of the morality of trusts, even when they rest on a basis of co-operation, is too large to deal with in answer to your question. Profit-sharing bears a family likeness to "piecework." There are, however, departments to which piecework will not apply. If twenty men carry a burden in such a way as that it is no way evident how much each man is doing, the honest ones of the twenty will have too much to do: the "organizing" man will fit upon each of these men's shoulders an indicator which will register the time-pressure, and he will pay accordingly; this is piecework. Profit-sharing goes a step further; it not only pays for work done, but it is supposed to stimulate to increase the supply of work; it is a payment on results after book-keeping shows that something more than the estimated profit has been earned. The manufacture of building materials, bricks, cement, joinery, &c., is easily organized into a routine, like the working of a railway or the distribution of goods; but what I understand by the building trade is a very complex thing, and it appears to me to be too difficult a business to deal with by means of any short formula to be written down in reply to so short a question as has been put. The work of a manufactory or of a distributing business is fairly steady; the growth of the number of letter carriers, for example, is slowly continuous. In the building trade it is not so (unless it is proposed to monopolize the whole trade of the country), so that there is much greater flux in the numbers of men on a builder's books than in probably any other business: where men come and go it is impossible to have what is known as co-operation. There is a fairly steady nucleus in most cases, and the principle might be applied to it; but building firms themselves are notably much subject to business vicissitude; their standing and capital do not in many cases command the same confidence as the standing and capital of, say, a railway company. Losses, weather, unforeseen rise in the price of slates, for example, accident, miscalculation—any one of these causes affecting one large job which may bear a very large proportion to the total capital of the "firm," will bring it into bankruptcy. It is well known that builders work under greater risk than other business men. I am unable to do more to assist "Stenographer" than by these very general remarks. P.

"Drain" or "Sewer."

LONDON, S.W.—C. N. writes: "A drain under the centre of one house also takes the drainage from houses adjoining on each side. The drains are shown on a plan, dated 1856, in the borough council's possession. Is the pipe under the centre house a drain or sewer, and who is responsible for its repair? Should not the sanitary authority serve all three houses with notice if serving any notice at all *re* defects?"

It would greatly facilitate the consideration of questions of this nature if our correspondents would furnish definite information as to the Act or Acts of Parliament under which the local authority obtains its powers, for according to existing conditions such details must naturally govern the legal definition as to what constitutes a "drain" or "sewer" in any particular instance. From the general tenor of the question it is assumed that this case does not occur within the London area (which is governed by the provisions of the Metropolitan Management Acts), but in a district subject either to the Public Health Act, 1875, or to the 1875 Act as amended by the Public Health (Amendment) Act of 1890. If the local authority has not adopted the Public Health (Amendment) Act of 1890, but is subject only to the provisions of the Public Health Act, 1875, then it would appear that the local authority is liable for the repair of the drain from the point where it receives the drainage of more than one building. Section 4 of the Public Health Act, 1875, states that a "drain" means any drain used for the drainage of one building only, or premises within the same curtilage, whilst the expression "sewer" includes sewers and drains of every description except "drains" as previously interpreted. In the case of *Travis* v. *Uttley* it was decided that a drain taking the discharge from several houses, and constructed on private property, and also passing under the buildings, was a "sewer" within the meaning of the Act. This case occurred at Halifax in 1893, the Public Health (Amendment) Act of 1890 having not then been adopted by that town. A similar decision was given in the case of *Acton Local Board* v. *Batten*, when it was held that a drain is a "sewer" within the meaning of the Act when more than one house has been connected with it. In *Pinnock* v. *Waterworth* the same view was upheld. Most towns have, however, adopted the Public Health (Amendment) Act of 1890, and under such circumstances the difficulty of determining what legally constitutes a "drain" or "sewer" becomes greater. Under section 11 of the Public Health (Amendment) Act, 1890, it is laid down that the expressions "drain" and "sewer" have respectively the same meaning as in the 1875 Act, *except* that section 19 of the 1890 Act goes on to declare that where two or more houses belonging to different owners are connected with a public sewer by a single private drain, then the local authority may recover the expense of repairs from the owners. Also, that for the purpose of this section the expression "drain" includes a drain used for the drainage of more than one building. In the case of *Seal* v. *Merthyr Tydfil Urban Council* it was decided that a drain into which sewage flowed from the houses of the owner as well as from the adjoining houses was a "private drain" within the meaning of the Public Health (Amendment) Act, 1890. In *Hill* v. *Hair* it was decided that a private drain conveying the drainage of two or more houses belonging to different owners is a "sewer" within the meaning of the Public Health Acts of 1875 and 1890, but this decision has been questioned in other cases. In *Eastbourne Corporation* v. *Bradford* it was decided that a local authority may treat a drain connecting two or more houses, the property of different owners, as a private drain, and repairable as such by the individual owners. A similar decision was given in *Self* v. *Hove Commissioners*. If, therefore, the 1890 Act has been adopted by the local authority, it is possible that the drain taking the drainage of the different house-owners would be legally considered as a "private drain" unless it can be proved that such drain had previously become vested in, or in some way adopted by, the local authority as a "sewer," in which case such drain would still remain a "sewer." For instance, if the houses were erected before the Public Health Act of 1848 was passed, it might possibly be shown that the combined drain had thereby become a "sewer" vested in the local authority under that Act; but the successful pleading of this argument would depend to a large extent on local circumstances. The mere fact that the whole of the house drains are shown on the plans of the local authority does not in itself necessarily prove that all such drains are "sewers." The local authority is not required to serve notices on all three houses, but only on the occupier and owner of the premises on which the nuisance is found to arise. T. E. C.

Fire-escape Stairs and Dancing Floor.

PAISLEY.—SCOT writes: "(1) Kindly refer me to some article on iron fire-escape stairs in hospitals, workhouses, &c. (2) What construction would be best for the floor of a small dancing hall as shown by the accompanying sketch plan (not reproduced), so as so allow some swing on the floor without breaking the plaster ceiling of shop below?"

(1) See Structural Engineer and Fireproof Constructor sections in "Specification, No. 6" (published at 6, Great New Street, E.C., price 5s. 9d. post free). (2) The dancing floor may be arranged as shown by your sketch, but, the floor joists being of 18ft. span, should not be lessthan 11in. by 3 in. and 15in. centre to centre. The common rule for depth in inches = $\frac{1}{2}$ span ft. by 2 and thickness = $\frac{1}{3}$ depth is not unnecessarily strong for ordinary use, and dancing puts a very severe strain upon a floor owing to the rhythmic vibration. The proposed 10 × $2\frac{1}{4}$ joists would by the ordinary formula for strength of beams $\frac{bd^2}{L}$ only carry safely a dead load of $\frac{2\frac{1}{4} \times 10^2}{18^2 \times 1{\cdot}5} = {\cdot}46$, say $\frac{1}{2}$ cwt. per sq. ft., including the weight of the floor itself.

HENRY ADAMS.

Wednesday, June 24.

JUNIOR INSTITUTION OF ENGINEERS.—Visit to Messrs. Spiers & Pond's model laundries, art dyeing and chemical cleaning and steam carpet beating department, 140, Battersea Park Road, S.W., at 6.30 p.m.

A CHURCH BANNER.

THE design of the diocesan banner for the Church Congress, to be held in Bristol in October next, has been made by Mr. G. F. Bodley, and the work is in hand. The central figure will be worked by Messrs. Watts & Co., of Baker Street, and the remainder of the work will be done by ladies of the Bristol guilds for church work, under the general supervision of Mrs. Hollis. The purpose of the banner is to emphasize the historical character which it is desired the Congress at Bristol shall bear. The central figure represents St. Aldhelm, Abbot of Malmesbury A.D. 676-705, and first Bishop of Sherborne A.D. 705-709. The groundwork of the central portion of the banner is a rich cream-coloured damask silk. All of the characteristic features of Aldhelm's person, dress and pastoral staff recorded in history are carefully reproduced. The face is to be painted, not embroidered. The arms of the See of Bristol, wrought in gold on black velvet, are placed above the head of the central figure. At the four corners of the banner, on a ground-work of blue silk, are placed the shields and arms of the city and boroughs of the diocese in the following order, beginning with the dexter chief:—Bristol, Malmesbury, Chippenham, Swindon. These will be painted on silk.

The following company is to be wound up :—

CANNING JARRAH TIMBER CO., LTD. H. St. J. Hodges liquidator.

Builders' Notes.

Heating and Ventilating.—Messrs. E. H. Shorland & Brother, of Manchester, have supplied their patent Manchester stoves with descending smoke flues to the isolation hospital at the Rainhill Asylum, Liverpool, and also the Somerset and Bath Asylum, Wells.

The South Wales Building Trades, Employers' Federation at its annual meeting at Newport last week appointed the following officers:—President and chairman, Mr B. Bennett, Swansea; senior vice-president, Mr. Watkin Williams, Pontypridd; junior vice-president, Mr W. T. Morgan, Cardiff; treasurer, Mr. William Thomas, Cardiff; auditors, Messrs. W. O. Jenkins, Swansea, and T. James, Pontypridd; secretary, Mr. W. H. Billings, Swansea.

The Ipswich Stonemasons have struck work, as the masters objected to a clause in the new code of rules stipulating that employers should have one apprentice to every four on an average. A conference was arranged, however, and the following rule has proved acceptable to both parties. "All employers to have one apprentice to four masons, but employers who do not employ eight masons shall be allowed to take another apprentice during the last year of his first apprentice."

Sub-letting Plastering Work.—At the tenth annual Irish Trades' Union Congress held last week at Newry a resolution was passed expressing the opinion that "the system of sub-letting work in the plastering trade is detrimental to its best interests by work being scamped in an unworkmanlike manner, and we respectfully urge on the architects of Dublin and the various public bodies the necessity that exists for the insertion of a clause in the specifications debarring contractors from sub-letting any portion of the plastering work." Another resolution was passed urging upon Irish local authorities the desirability of using Irish setts as a street pavement.

Electric Wiring Conduits.—Owing to the continued and increasing demand for the Simplex Steel Conduit System, and with the object of furthering the mutual interests of customers and themselves, have considered it desirable to open premises of their own in Glasgow at 165A, West George Street, under the management of their Mr. D. G. Brooks, and have there a large stock of all grades of conduits and fittings ready for immediate delivery.

Appointments Vacant.

NATIONAL ASSOCIATION MASTER HOUSE PAINTERS AND DECORATORS OF ENGLAND AND WALES. Incorporated.
TO DECORATIVE ARTISTS.

It is in contemplation to establish a PAINTING SCHOOL for House Decorators, and the Committee are open to receive applications for the position of Teacher or Master.

The School will be established in some central provincial town, and would be in session only from October to April.

The exact curriculum will be decided by the Committee in consultation with the Master appointed, but the qualifications required in the latter would be thorough knowledge of the different schools of decorative art, methods and processes, and a good executive ability as a decorative artist. Hours 8.30 to 6.30 p.m. Saturdays 1 p.m.

Applications, with credentials and specimens of work and salary required, to be sent to W. C. Sutherland, Secretary, Registered Offices of the Association, 26, Oxford Street, C.-on-M., Manchester.

ARCHITECT'S PUPIL.—A VACANCY occurs in a busy West End office. Very small premium required, but must be fond of drawing and industrious.—Barrett, 23, York Place, Baker Street.

WANTED in the Midlands for artificial stone business and fireproof construction, good all round, smart, energetic ENGINEER, able to manage workmen and influence business; preference given to one having experience and knowledge of stresses and strains. Apply in confidence, stating salary required, and give full particulars to S. G., c/o Builders' Journal Office, 9, East Harding Street, Fetter Lane, E.C.

WANTED WORKING YARD FOREMAN AND TIME-KEEPER in large Builder's Yard. One thoroughly capable, energtic, and an early riser. Must live on premises, married, without encumbrances, wife as housekeeper to do plain cooking.—Apply Box 2494, Builders' Journal Office, 9, East Harding Street, Fetter Lane, E.C.

Miscellaneous.

ALL SEEKING APPOINTMENTS.—Poor Law, County Council, Educational, Municipal and other Public Bodies, should send for Classified List of Vacancies throughout the Kingdom.—"The Press" Agency, 155, Duke Street, Liverpool.

BRICKWORK and POINTING Wanted by Rod or Lump. Town or country. Good references.—E. H., 11, Charles Street, Barnes, S.W.

FOR SALE, owing to death, the business of a BUILDER and PUBLIC WORKS CONTRACTOR of high standing in a large and busy centre. Purchaser will take full benefit of large Contracts partly executed. Weekly wages average £500. Vendors would allow working capital invested to remain in business for limited time to approved Purchaser, if desired. Principals only, having command of at least £20,000, will be treated with. No Wedges Required.

GREAT LABOUR-SAVING APPLIANCE.

SAVES MORE THAN ITS COST IN FIRST JOB.

CAN BE FIXED IN TWO MINUTES.

Hunt & Fage's New, Quick, & Easy Method for Erecting Scaffolds.

CONTRACTORS and Builders well know what a costly item scaffold erecting is, as it takes two scaffolders fully 15 minutes to fix up one ledger brace or puncheon pole to standard with the scaffold cord and wedge system, and each tie costs sixpence, at least, whereas by using HUNT & FAGE'S New Appliance a ledger or other poles can be securely fixed in position in less than 4 minutes, thus saving in wages fully fourpence in every tie, and the simple method of fixing is shown in the drawing.

50% can be saved by the use of the above.

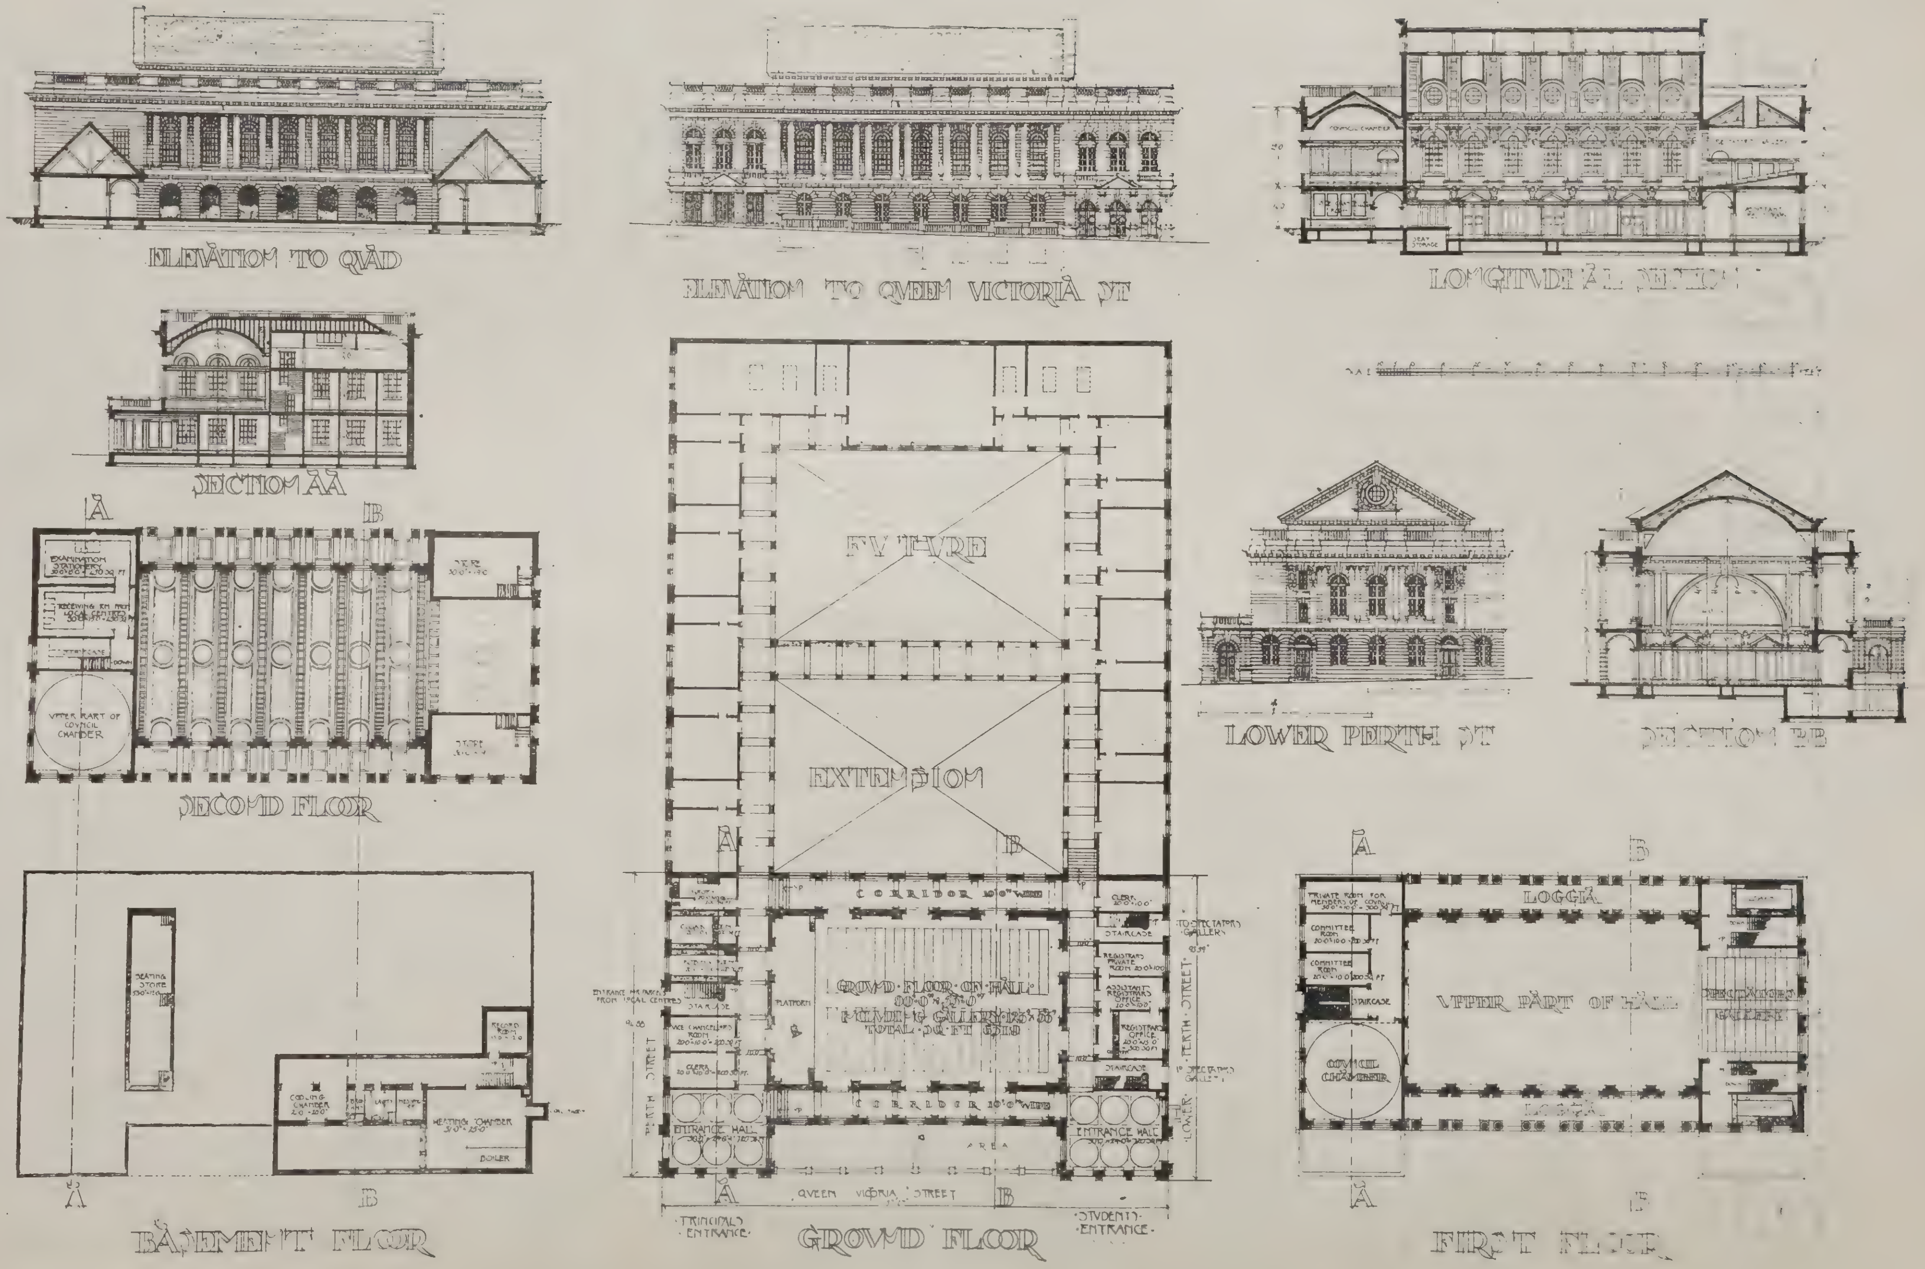
Standardizing Bricks. There seems every prospect that the standardization of bricks will soon be a *fait accompli*. The R.I.B.A. has been taking an active interest in the matter for the past year or two, and has had before it facts and expressions of opinion from all branches of brickmakers, architects, engineers and builders. It will be remembered that a conference on the subject was held at the Building Trades' Exhibition two years ago, when a tentative standard was suggested. Since then everything has been done to meet the objections raised, and at the second conference which was held at the Exhibition on Friday last a very satisfactory and amicable tone prevailed: so that the recommendations of the Institute were agreed to without dissent. These recommendations are as follows:—The length of the brick should be double the width, plus the thickness of one vertical joint. Brickwork should measure four courses of bricks and four joints to a foot. Joints should be ¼in. thick; and an extra $\frac{1}{16}$, making $\frac{5}{16}$, for the bed joints to cover irregularities in the bricks. This gives a standard length of 9¼in. centre to centre of joints. The bricks, laid dry, to be measured in the following manner: (A) Eight stretchers laid square end and splay end in contact in a straight line to measure 72in.; (B) eight headers laid side to side, frog upwards, in a straight line to measure 35in.; (C) eight bricks, the first brick frog downwards and then alternately frog to frog and back to back, to measure 21½in. This is practically the same standard size as that proposed two years ago, but the all-important margin of 1in. less as to (A) and ½in. less as to (B) and (C) has now been allowed, which does away with the most serious objections. The above standard is to apply to all classes of walling bricks, both machine- and hand-made. It cannot of course be forced on brickmakers or others, but we understand the Institute will strongly urge architects to regularly specify the standard size. The engineers, too, have given their support to the proposal—in fact, to everyone concerned the standardization of bricks must be a blessing. At present it is apparently more particularly intended to apply to London and neighbourhood, but the final aim is to secure uniformity throughout the whole kingdom. Naturally this cannot be done at once; it is a matter of time; but that is the end to work for, and we were glad to see how favourably the proposal was received at last Friday's conference by representatives from many parts of the country. The Belfast Brickmakers' Association, after being in consultation with the Ulster Society of Architects and many other architects in the north of Ireland, express their approval of the scheme, so that already it has gone far beyond the radius of the metropolis: a fact which is especially significant when it is remembered that the bricks used in Belfast, as in Glasgow and Edinburgh, are very much larger than those used in London. Naturally there are many details which time alone will settle. But if architects will only make it a point to specify the standard size of brick, and see that such is delivered, the whole of the makers will very soon fall into line. At present with bricks of varying sizes it is quite impossible to stock terra-cotta, a disadvantage which would of course be removed were all bricks of one standard. It is worthy of note, as showing how the varied interests are agreed, that among those present at last Friday's meeting—at which the Institute's recommendations were unanimously adopted—were Mr. J. C. Hill (president of the Clayworkers' Institute), Mr. S. E. Collier, of Reading, Mr. King (president of the Institute of Builders), Mr. A. T. Walmisley, the well-known civil engineer, Mr. G. E. Wragge (Eastwood & Co.—Kentish brickmakers), Mr. Bernard J. Dicksee, district surveyor for Newington, Mr. Max Clarke, Mr. R. Leah (president of the Manchester Society of Brickmakers), Mr. H. H. Bartlett (Perry & Co., Bow), Mr. Anderson and Mr. Jeffrey, of Gloucestershire, and M. Arthur Metz (president of the Union Céramique de France)—Mr. Thomas Blashill occupying the chair, supported by Mr. H. D. Searles-Wood.

An R.I.B.A. Week. The general meeting of the Royal Institute of British Architects (and the presentation of the Royal Gold Medal) on Monday, the annual dinner yesterday, and to-day's meeting of the presidents of the eighteen allied societies by invitation of Mr. Aston Webb—all suggest to Mr. Butler Wilson the establishment of an annual R.I.B.A. week in London, and elsewhere as might be determined, following the custom of other institutions. A special week of this nature, says Mr. Butler Wilson, could be made a distinct benefit and attraction to members of the Institute. "Promoters of special exhibitions dealing with matters connected with architecture and the kindred arts would quickly find it to their interests to make their displays coincide as to time and place with such an event." And he suggests the following programme:—Monday: Exhibition of prize drawings, visits to exhibitions and displays of handicraft, materials, &c., general meeting and presentation of Gold Medal. Tuesday: Visits to buildings completed or in course of erection, and president's "At Home." Wednesday: Meeting of presidents of allied societies with president of the Institute, special papers and discussions, annual dinner. Thursday and Friday: Excursions to places of interest. We commend Mr. Butler Wilson's suggestion to the Institute. It has every prospect of affording a socially enjoyable and architecturally useful week.

Popular Opinion about Westminster Cathedral. While architects of ability are expressing their great admiration for Bentley's cathedral — brought into being through the energy of Cardinal Vaughan, so lately dead—the general public are voicing quite other views. Not long ago an Oxford paper, commenting on the gale in London, observed that unfortunately the wind, though likely to blow away several hastily-erected suburbs, was not strong enough to remove the tower of the new Roman Catholic cathedral at Westminster; while another gentleman, who admits in the columns of the "Pall Mall Gazette" that he is neither an architect nor an artist, calls the building "a glorified public baths or waterworks, pumping station, chimney and all." Such criticism is mere claptrap, the expression of ignorance and of vague likings, of sentimentalism and architectural bosh. These "common-sense" critics look up at the great campanile rising nearly 300ft. into the air, and having the idea rooted in their mind that the tower of a church must be covered with pinnacles and crockets, they declare themselves as well pleased with a chimney stalk; they have absolutely no sense of its fine proportion, nor of the relative placing of the masses around it. It is nothing more to them than a chimney stalk, which they take for granted must be an ugly thing, just as they take for granted a profusely decorated building, casket, or what not, must be beautiful. And these are the very people who have unstinted admiration for some of the most appalling buildings. England is a free country, no doubt, and everyone has a right to express his own opinion: nevertheless the man in the street should be told that Westminster Cathedral will outlive all his ignorant opinions, and that a magnificent structure into which a great architect has built his life demands more respect than some percentage design of mediocrity.



SECOND-PREMIATED DESIGN FOR UNIVERSITY BUILDINGS AT CAPE TOWN. J. EDWIN FORBES, ARCHITECT.

THE REFORM OF ARCHITECTURAL COMPETITIONS.*

By JOHN MURRAY, F.R.I.B.A.

I HAVE pleasure in laying before you for your consideration my views upon this important subject; they are, however, not all new nor original, and it is not my intention to touch upon every point which might be discussed, but only upon those main facts which appear to me to chiefly bear directly upon the system and its evils, and the effective reforms required to put architectural competitions upon a sound and secure basis which will be acceptable and satisfactory both to the public and the architectural profession.

In the first place, let us have a practical definition. What is an architectural competition? It is a tempting bait cast forth by keen businesslike promoters to an overworked and underpaid profession.

This burning question of competition reform is continually before us, and judging by the various opinions of architects which we hear and read almost daily the solution of the problem seems up to the present to be but little nearer. It is generally admitted—and I agree—that architectural competitions, both open and limited, when properly conducted are a benefit to the art of architecture, but that the present method of carrying them out is unsatisfactory; and it is urgently desirable to obtain some reform in their arrangement and administration. Competitions appear to have been originally instituted without sufficient consideration of the subject in all its bearings both on the part of the promoters and the competitors, and the time has now arrived when the subject can be fully considered and some permanent arrangement arrived at which will be satisfactory to all concerned.

The solution of the competition problem appears to me to rest entirely with the architectural profession, which must combine and work together to obtain effective reformation. We have a competition committee of the Royal Institute of British Architects, and a council to guide us, and yet no adequate, sufficiently definite and common procedure has yet been formulated by them for the guidance of promoters of competitions and architects generally. How often we see members of the Institute appointed advisers and assessors, and the procedure of the competitions under their guidance very different. Some common course of action should be adopted by the profession, and if such were made known to those promoting competitions (who are generally ignorant of the subject) good results would undoubtedly follow. Effective reformation in this matter can only be obtained by drastic measures, and these should strike at the root of the defects.

In arranging any scheme of reform there is the all-important side, the interests and the authority of the public and promoters to consider as well as those of the architectural profession. Fairness I am quite sure is the desire of all, and what the public and promoters obtain they would, I feel convinced, be willing to pay for reasonably. Lack of knowledge on the part of the promoters is a fruitful source of the existing evils. If a reasonable payment were demanded by a united profession for competition work, promoters would not so lightly undertake the compilation of such vague conditions and issue such unfair invitations to architects as they have generally hitherto done.

Under the present system what an enormous amount of time, labour and money is so often expended by a number of architects upon designs for a building, the total cost to the profession amounting to thousands of pounds, while the payment made by the promoters through an inadequate system of premiums is often only a very small percentage of the total cost of the work done by the competing architects. We have seen sometimes that the design placed first has broken some important condition, which condition has deterred a more honest competitor from planning the building upon the lines of the winning design. It has sometimes happened, although in future by careful conditions it should be made almost impossible, that a design could be materially improved and a much better solution of the problem obtained by overthrowing an important condition, and I consider the promoters should be able to obtain, if they wish, the benefit of a design thus improved; but in such a case let assessors be fair, fearless and bold in their award. Let the award of the first place be given to the best design which is in accordance with the conditions of the competition, and let assessors boldly show to the promoters the superiority of the design which has violated the conditions, and even go so far as to advise its execution if they think fit. Then let the promoters acquire and carry out the design which has transgressed, if they wish, but compel them in such a case to adequately compensate the competitor whose design was placed first by the assessors, and which has fulfilled the conditions laid down. This would give the promoters liberty of action, which they should have even after the assessors' award and advice be given, but it would give the promoters no more than they often reserve at present, and to which they should I think have a right. Promoters should be in a similar position to a private client, who can do, and often does, as he pleases after the advice of his architect has been given, but he nevertheless has to pay for all the work done for him. If the promoters, however, were at first to definitely agree by their conditions to appoint the architect to carry out the work whom the assessors advised, there is no doubt the promoters would gain by obtaining more and probably better designs.

PERSPECTIVE VIEW OF SECOND-PREMIATED DESIGN FOR CAPE - UNIVERSITY.

The following are, I consider, indisputable facts which show the unsatisfactory position of the existing state of things:—

1. The system of architectural competitions has developed gradually without any general definite and logical rules being applied to it by any responsible and sufficiently enlightened authority—the inevitable result of which in most similar matters is chaos; and that is what practically now prevails in this case.

2. It is absolutely essential for the promoters to receive some good professional advice in order to frame proper conditions for a competition.

3. The system of offering two or three premiums is not satisfactory, and from this arise many evils.

4. The promoters are generally not cognizant of all the regulations which are necessary to compile a proper set of conditions for the design required; and if an architect be engaged to advise upon the conditions, even he is not infallible in dealing with such a complex subject.

5. The one-man assessor has proved to be unsatisfactory in numerous cases.

6. Architects compete in order to obtain the work, and not to win the inadequate premiums usually offered.

7. The premiums usually offered are totally inadequate to pay reasonably for the large amount of work required by the conditions.

8. The combined amount of work done and money expended by architects upon competitive designs is undignified, and is not calculated to serve the best interests of the public, the art of architecture and the architectural profession.

9. The large amount of work done and the vast amount of time spent by individual architects in preparing competitive designs by the existing system is often very costly, and also entails the loss of a large amount of time and money to the profession, which should be used in other directions—*inter alia*, to assist in raising the dignity and influence of the art of architecture, and in physical recreation, which it is so imperative for an architect to take for his health's sake.

10. Sometimes an impossible condition is framed. One in point is demanding a building of a fixed and stated size to cost a fixed sum when the size demanded cannot possibly be erected for less than about 25 per cent. more than the limit of cost stipulated.

11. A competition is very often won in consequence of the first few main setting-out lines of the plan being correct, and which indicate the right and best scheme because from them proceeds the whole design, and the most artistic building and best architecture invariably emanate from the best plan.

12. It is not always the best or most skilful architect who wins a competition, but the one to whom the best scheme of the main disposition or setting-out has occurred; and although this is only obtained sometimes after much work in testing every possible solution, and is often the outcome of an immense amount of thought and skill, it is not always so.

13. The best and most eminent architects are frequently too busy to undertake so much

---

* A paper read before the Committee of the Competition Reform Society on May 15th, 1903.

work as is demanded by the present system of competitions.

14. Many young architects of much ability, and even perhaps genius, have neither the time nor the money to spend upon the lavish competitive designs which are now fashionable.

15. The average architect who makes a practice of entering competitions wins so few that the total payment derived eventually from those he wins does little more than pay a small pittance for all the competition work he has designed, the result of which, like the unfortunate limit of 5 per cent. payment (which should be raised), is poverty, and thus another step towards the ignominy of the profession generally.

16. The result desired by promoters should be, and avowedly is, to obtain the best design possible under the conditions of the special case, and also the best architect for the work; but under the existing system it frequently occurs that neither of these is obtained.

17. The designs awarded premiums have sometimes not been in accordance with the conditions which have been laid down as rigidly binding upon competitors.

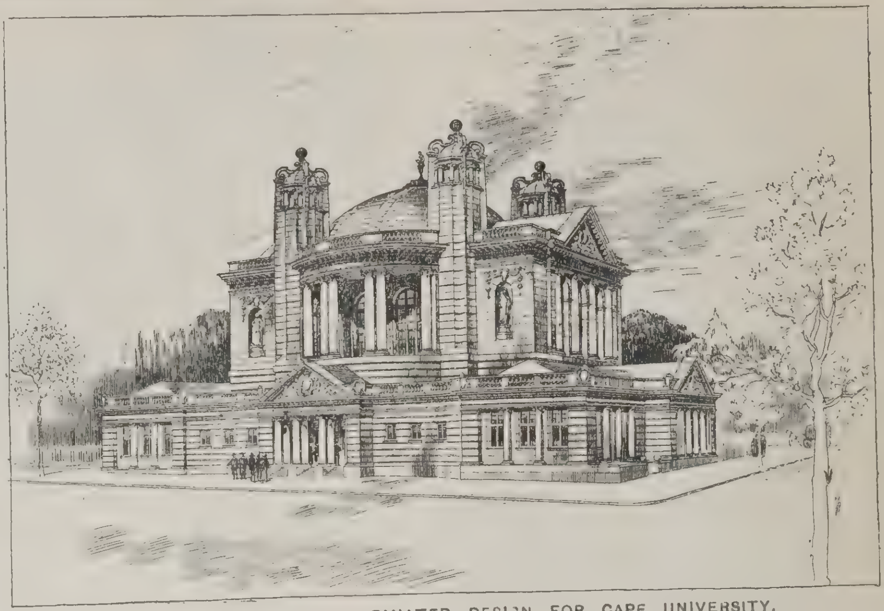
18. All the intricacies of an extensive building problem have sometimes not been fully seen nor known to the promoters, nor to the assessor or adviser when drawing up or advising upon the conditions for a competition, and some important point has been discovered by a competitor whilst working out the scheme which has been most beneficial to the whole design, although it has revolutionized some of the original conditions. This should, however, in the future be possible upon very rare occasions, as the conditions could be framed to prevent it.

In view of the foregoing facts I am constrained to suggest the following reforms for the consideration of the Competition Reform Society and the profession generally, and I am convinced that by the assistance of these or somewhat similar reforms a mitigation of the present evils can to a very considerable extent be obtained, and I think probably they can be entirely eliminated.

1. The Royal Institute of British Architects through its council should take the lead in redressing this professional grievance, and should formulate and publish some definite rules or regulations to guide promoters, assessors and competitors; and without the concurrence of the promoters in these, all members of the Institute and its allied societies, at least, should abstain from the competitive work, and the Institute should communicate with all its members requesting them to do so. This might also be made a definite condition for future candidates for election to the Institute to undertake before, or as a condition of, their election. The penalty to be inflicted upon any member of the Institute and its allied societies for breaking any of these rules should be dismissal from their membership.

2. Every assessor should approve the conditions before accepting his appointment, or make his acceptance conditional upon his approving the conditions proposed by the promoters, and unless the conditions be framed in compliance with the Institute rules or regulations no member of the Institute or of its allied societies should accept an assessorship. The conditions should be so framed that they form a definite and binding agreement between the promoters, assessors and competitors.

3. There should be a jury of three assessors, two of whom should be architects and the third a specialist appointed by the president for the time being of the Royal Institute of British Architects, because the innate conservative instincts and diverse opinions of Britons will not always permit one British architect to judge and arrive at a satisfactory and unbiased conclusion upon such a complex subject, which involves a combined knowledge of art, science and business. The design placed first by the jury must be in strict accordance with the conditions, and should be accepted by the promoters; they, however, reserving the right to acquire and carry out any other design they please, provided they compensate fairly the competitor whose design be placed first by employing him as architect to carry out the building or work. This would prevent any possible chicanery such as has been known to exist, and the architect placed first by the jury would be doubtless as capable —probably much more so—than the competitor who had violated the conditions. In order to adjudicate fairly upon some designs it would be of the greatest possible assistance to receive an engineer's or other expert's opinion, and this jury system would fully meet such a contingency.



PERSPECTIVE OF THIRD-PREMIATED DESIGN FOR CAPE UNIVERSITY.

4. The fee to be paid to the jury should be higher than at present prevailing, and a scale might be arranged by the Institute which might be regulated within limitations by a percentage of, say, one guinea per cent. upon the cost of the building or work proposed to be done, plus a fee of, say, one guinea for each design submitted, and the total equally divided among the jury.

5. The conditions should require small-scale sketches only to be submitted in a first competition to show the general scheme of the design, and such sketches should be limited to pencil only, and not be elaborately finished in any way, nor any unnecessary work repeated thereon. The scale should be one-sixteenth of an inch to 1ft. or less.

These sketches could be done quickly, and with very little or no expense to the competing architects, but they would doubtless contain very fully the architect's own personal handiwork and embody all the main ideas of the design, which would be sufficiently intelligible to the assessors.

6. The sets of sketches submitted should be examined by the jury, and the best selected by them if there be perfect unanimity in their opinion, or, failing this, they should select a few of the best designs, about six, more or less, according to the necessities of special cases, and the designers of these should be requested to enter a second competition in which more finished drawings should be required, and the work then demanded should be no more than it is customary to require by the existing system, and unnecessary repetition should be prohibited. The selected sketches should be marked or photographed and returned to their respective designers, who should send them back again unaltered with their more finished designs. A perspective drawing should not be required unless in a very exceptional case, and then it should be drawn by every competitor from one definite and fixed point of view. The jury should jointly examine these more finished designs in conjunction with their original sketches, and select the design which in the opinion of the majority of the jury is the best, and report their selection to the promoters. There should be no selection of a second and third design, a proceeding which is fraught with great difficulty and danger; and there should be no award of premiums by the jury, for they are neither necessary nor desirable. A copy of the jury's report should be given to each of the six, more or less, selected architects. The unsuccessful sketches should be returned to their respective designers after the final award be given in the second competition, and the name of the successful architect be announced to each competitor.

7. A sum equal to the total amount now usually awarded by the two or three premiums usually offered, or somewhat more, should be equally divided between the six, more or less, selected competitors as expenses, and upon receipt of their more finished designs, and the amount so awarded to the successful competitor should not merge in the commission or payment for the work if it be subsequently carried out.

In case the work be abandoned or be not proceeded with within twelve calendar months after the award be given, at the request of either the promoters or the competitor whose design was placed first by the jury a payment should be made by the promoters for the competition drawings of the said competitor, whether they be those done in the first or both first and second competitions, amounting to a sum equal to 2 per cent. upon the estimated cost of the building or work, and after such payment the said competitor should have no further claim upon the promoters.

Any subsequent business done by or between the promoters and the said competitor to be by a new and agreed arrangement, as if the competition had not been held.

8. In limited competitions the same arrangement should be adopted as embodied in the preceding clause.

9. The first-selected design only should become the property of the promoters, and that only when they have fulfilled their part of the conditions and employed its designer to carry out the work or paid the sums set out in the conditions. If the promoters desire to acquire any of the other designs

besides the one adjudged the best by the jury, they should have power to do so by paying the designer of the work required a fee of 1 per cent. upon the estimated cost of the building or work as proposed by the promoters, but the architect whose design was placed first by the jury should be employed to carry out the work.

10. The Institute should take steps to obtain and examine systematically the conditions of all published or known competitions, and all architects, or at least all members of the Institute and its allied societies, should abstain from competing in all cases where the conditions have been disapproved by the Institute — such disapproval to be made and publicly advertised by the Institute as may be hereafter determined.

Generally.—By this system which I have suggested the promoters would obtain the best architects and the best designs; there would be little or practically no loss of time and money to the profession; and I claim that the system is commercially sound.

The young men, older practitioners and busy architects could all compete without detriment to themselves or their work, and the promoters would thereby obtain better designs and more talented architects than is often possible by the existing system.

The promoters, after laying down conditions and obtaining designs, would have to pay the successful architect some compensation if they changed their views and selected another design, or failed to carry out the building; but they would lose nothing, as they would be only paying fairly for the work they caused to be done, in a similar way that a private client would do after giving instructions to his architect.

There is at present too much conservative individualism and not sufficient combination amongst architects upon this whole subject, and it is only by a strict adherence to the principles embodied in the old adage "Union is strength" that a successful solution of the competition difficulty will be eventually obtained. This almost universal unity of action we see around us to day on all sides, but it is not prevalent amongst architects, who are unfortunately far behind in this most desirable quality. We need more *esprit de corps* amongst us, and a more universal desire to work for the common good of the public and the profession as well as for ourselves individually.

The past history of competitions does not help us much except to prove the existence of their inherent evils from the beginning.

I have searched for some of the earliest records extant upon this subject, and have studied many of them. I have found that many years ago a special committee of the Royal Institute of British Architects was appointed to enquire into the subject of competitions, and they reported to the Institute on February 24th in the year 1839, about five years after the Institute was founded, and when Earl de Grey was president, Charles Barry vice-president, Thomas L. Donaldson hon. secretary, and the Institute contained such distinguished men as Messrs. Gwilt, Hardwick, Papworth, and others equally honoured.

The conclusions of that committee embodied complaints which were very similar to those we hear on every hand to-day, and the committee then and the Institute itself from that day until now have failed to effectively tackle and solve the one necessary and all-important point, namely, of formulating a system which will put competitions upon a satisfactory basis. No one has hitherto had the courage to thoroughly face this difficulty, although apparently it has always been admitted that the problem can be solved by a united profession.

I will now give you a few extracts from the report of that committee, and a few notes of mine thereon, by which you will see the unsatisfactory and incomplete condition in which the Institute then left the subject, and it has remained in a very similar condition with comparatively little improvement from the 24th day of February, 1839, until the present, being a period of upwards of sixty-four years. The council of the Institute reported upon competitions on May 6th, 1844; Mr. Cole A. Adams instituted a memorial which was presented by Mr. Street to the Institute in the year 1880; the conference of architects submitted some resolutions to the Institute on May 23rd, 1881; several papers have been read upon the subject, but all have failed to formulate an effective remedy which will eradicate the inherent evils.

"Your Committee are deeply impressed with a sense of the great and manifold evils arising from the defective system upon which competitions have been hitherto conducted, not only as regards the parties immediately concerned in them, but also the general interests of the public and the reputation of the profession at large; since it is abundantly proved that men of eminence are deterred from entering into competitions under a system which experience has taught them involves inherent principles of injustice.

". . . and it appears to your Committee that some endeavour at least to remedy them is required for the interest both of the public and the profession. As to the policy of competitions in general or the comparative advantages of open or select competitions, your Committee do not feel called upon to give an opinion. They conceive their duty to be limited to the investigation of the system as it exists. They avoid the consideration of any evils but those they consider inherent in it. They suggest no remedies for these evils but such as they think

the public will feel it to be their interest to adopt. They insist upon none but those which it lies within the power of the members of the profession to apply; and they think it not too much to expect from the Royal Institute of British Architects—an association founded and incorporated with the express object, among others, of promoting the interests of architecture—that they should interfere to the point of adopting and confirming their opinions thus far.

[I strongly urge that a new system should now be adopted and effectively carried out by the R.I.B.A.]

"Your Committee feel confident that the introduction of a better system by those who have the wish to do justice would be sufficient to crush the power of doing wrong, which has too long been indulged with impunity.

[This system has never been introduced.]

"It rests entirely with the professor to decide for himself whether the conditions, and the personal character of those who propose them, are satisfactory. . . .

[The profession as a body must decide.]

"But whatever the conditions may be, they ought to be clear and explicit, that the competitor may know precisely and unequivocally upon what he has to rely. Whenever it may be expedient to lay down definite instructions, they ought to be strictly adhered to, when judgment is to be founded upon them, and every design rejected which shall be found not to conform to them. . . .

"As the formation of definite preliminary instructions and a decision strictly founded upon them require more experience and knowledge of architecture than miscellaneous committees may be generally supposed to possess, it is suggested that in all cases competent professional advisers should be referred to upon these and other points connected with the duties of the Committee, but without taking the final decision out of the hands of the original parties to the competition or relieving them fro its responsibility. . . .

"Perspective drawings, if correctly made, are certain desirable to show the proper effect of designs, but th should be restricted to specified points of view . . .

"They have the greatest reason to believe, from t information they have obtained, that in a very gre majority of cases of competition* the committees parties to whom judgment is confided are quite ready acknowledge themselves deficient in the means of fu filling their duty, when once the nature of that duty candidly and temperately explained to them; and th any suggestion to the effect above stated will be favou ably received when offered in proper terms and at proper season. But to effect this object rests with t profession at large,† upon whom the Committee wou urge in the most earnest manner the necessity of refusi to enter into any competition which does not offer sufficient guarantee that it will be conducted both wi intelligence and justice. To secure these desirab requisites in competition let every architect exami the conditions . . . and address to the authorised par the most searching enquiries‡ . . .

[* This was before the one-man assessor wa generally appointed. † The profession large cannot act effectively as individual and can only so act through the R.I.B. ‡ This has been left to individuals, but shoul be done through the R.I.B.A. Council.]

"Although the enquiries which may be addressed professional men to the institutors of competition mu necessarily be dictated by the peculiar circumstances every case, yet the following, although merely propos as explanatory of the intentions of the Committee, m be found generally applicable :—

"By whom are the designs to be examined a selected?

"Have any designs been laid before the parti previously to the competition being proposed?

"Have the parties any architect or person professi to be an architect in their employ?

"Will any means be adopted to ascertain that t designs can be executed for the sums estimated?

"Will the parties undertake to lay aside all desig which cannot be executed for the sums estimated?

"Is it the intention of the parties at once to exclu from the competition all designs not in strict conform with their instructions in every respect?

"Will the architect whose design is selected employed to execute the work, provided his charact and standing in the profession be such as to render hi unexceptionable?"

Regarding some shortcomings in th report, I will now only refer to the fact th the committee pointed out serious evils in t system of competitions, and some of the exist until to-day: they suggested remedies for these evils, "but such as th think the public will feel it to be the interest to adopt. They insist upon no but those which it lies within the power the members of the profession to apply."

Now these suggested remedies have prov to be insufficient, and I feel that the re remedy required is to go further and form late such methods of action and such system that not only the public but profession itself, both collectively and i dividually, will feel it to be their interest adopt; and also to insist that these metho of action shall be applied by the Royal Ins tute of British Architects as the governi body of the profession, not leaving remedy to be applied by individual memb of the profession, as this has been tried upwards of the last sixty-four years and h miserably failed.

It appears to me to be the greatest fol that an overworked, underpaid and lon suffering profession has allowed itself remain since the founding of the Royal Ins tute of British Architects under the scou of these competitions, containing ev which have been readily, continually a universally admitted to exist by archite during that long period, and yet sufficiently strong, effective and businessli action has been taken to remedy the ev until this Competition Reform Society w recently established.

There has been since the year 1839 a lo timid and vacillating policy adopted ab this subject by individuals with the cons and approval of the Royal Institute British Architects, and it is now high ti that the Institute should take the lead its and thoroughly work out the whole proble and adopt a strong, combined, vigorous a effective policy upon the matter, which w commend itself to both the public and architectural profession, and which will b solution of and protection from the e which have attended nearly all competiti

DESIGN FOR LIVERPOOL CATHEDRAL BY MALCOLM STARK.

since their inception. Some may still ask, Is it possible to solve this problem? I say most emphatically it is possible, and by dignified and honourable methods. Some may hurl at me the accusation that my methods are only a glorified form of trade unionism. I frankly admit there may be some similarity in my suggestions, but it is not necessary, reasonable nor fair to apply such a title to them; and I contend that the requirements of this age, which are very different from those of our forefathers in many respects, demand united action in this matter and upon the best and most forcible lines. Some may urge that my methods would wreck the Institute, but in my opinion they most certainly would not do so: the Institute is now strong and rich enough to thus assert itself and manifest its strength, and anyone who would leave it or hold aloof from it for such a reason could not be imbued with the true interests of our art and progress, and such men would not add any good influence or dignity to the Institute. A simple solution, moreover, could be obtained by the Institute testing the methods I suggest in a few cases, which could doubtless be readily and easily arranged.

I have spoken somewhat strongly, but I consider the theme demands it; I possess the conviction of my opinions as well as proofs of my statements, and I feel sure that it is only by energetic and vigorous methods based upon the lines of those which I have suggested that this difficult problem will be solved. Solved it can be, and solved it should be.

A.A. COMPETITION DRAWINGS.

THE drawings submitted for the Architectural Association competitions are now on view at 56, Great Marlborough Street, W. There were four competitors for the Travelling Studentship (£25, for at least a four weeks' tour), the first place being gained by Mr. Alan G. MacNaughtan and the second by Mr. Vincent Hooper—the drawings by the former are undoubtedly the best sent in: one of the competitors, we notice, gives us a version of "L'Art Nouveau" as spoken in an English drawing-office. For the Silver Medal (£10 10s.) a design for a town hall in a small country town was required. The winning design, by Mr. A. A. Carder, is a tempered piece of work well carried out. Mr. L. G. Detmar secured second place with a design of average merit. "Si Fractis Fortis" is praiseworthy, but "Nihil Sine Labore" shows that even labour does not of necessity give us anything cherishable: while the author of "La critique est aisée et l'art est difficile" (what a fascination lies in pedantic Latin or literary French!) would do well to remember that criticism cometh as well from within as without. Four competitors submitted drawings from the Banister Fletcher Bursary, the first place being awarded to Mr. J. Gillespie for some fairly-well executed drawings of All Saints', Pavement, York; St. Martin's Church, York; The New House, Kinross, and other buildings. Mr. A. A. Reeve has secured honourable mention for some commendable measured drawings of the Horse Guards and the Orangery at Kensington Palace, while the remaining two competitors deserve praise for choosing to measure a fine building which is threatened with demolition—All Hallows, Lombard Street. The Architectural Union Company's prize of £10 for measured drawings is not awarded, while the decision over the Essay prize—subject: the life, work and influence of Robert Adam and his brothers—is not yet given. There was only one competitor for each of these two latter prizes.

Construction Notes.

Wallpaper and Hangings. APART from considerations of the design and the appearance of a wallpaper under certain conditions, the architect should also consider the means of its manufacture and the materials of its composition. Wallpapers and hangings may be divided into two main classes: (1) the printed papers, and (2) the flock and relief. With regard to the first, the printing is done either by hand or machine. In the hand printing the colours of the different blocks are not applied until after the colour is dry, while in those printed by machine the various colours follow on wet, the whole design being printed as the roll of paper passes through the machine. It will, of course, be easily understood from these conditions of manufacture that hand-printed papers have greater sharpness and accuracy, each colour being distinct and separate, while in the machine work they frequently run together more or less. The hand-block printer also has the advantage of being able to print two or three pieces at very little extra expense, whereas with machine-made papers the cost of "setting" a machine is so considerable that it does not pay unless a large quantity of paper is printed, the consequence being that after a year or two it becomes impossible to repair a room with machine-printed paper or to repeat the same design if desired. The flock papers are made by printing on the paper with a cementitious material and then scattering finely-chopped wood fibre evenly over it. As each different colour requires to be worked separately and strewed with wood fibre, the process is, of course, very expensive. The coverings in relief are prepared by a variety of special processes which are to be referred to the general principles of embossing by the application of pressure or moulding when in a plastic or flexible condition, either separate or combined. With regard to the materials of which wallpapers and hangings are composed, the colours are either distemper or oil. The distemper colours have a tendency to fade in sunlight, though much depends upon the colours chosen and the composition. Papers printed in oil colours always darken and yellow—*i.e.*, the ground does—giving a dingy and shabby appearance unless the designer has made allowance for it. When new they are often good in effect, though, I think, they never equal distemper papers. They have one advantage over distemper in allowing a tint to be gradated by the mezzo-tint process. Papers printed in oil colours may be twice sized and then varnished so as to allow washing, but a varnished paper is always unpleasant. Papers sold as varnished ready for hanging should be avoided, for they are varnished with a quick-drying, hard, white spirit varnish, and have very little durability. If a varnished paper is desired it is best to varnish it after hanging. One little point worth noting in connection with varnished papers is—that allowance should be made in the paint of the room for the yellowing of the varnish. In wallpapers from reputable manufacturers there is no danger to be apprehended from poisons in the colouring matters, but from the smaller manufacturers a warranty should be obtained that the green papers are free from arsenic (even then it is best to test them oneself) and that papers of other colours are free from copper or mercury. "Pulp" papers have the back of the paper the same colour as the ground of the front. Papers in which the ground or pattern, or both, have a sheen as of satin are known as "satin" papers, and are made by mixing Spanish white with the colouring matter and polishing it with a burnisher; such papers are very susceptible to damp, and should be protected by a lining paper. The materials of which the coverings in relief are composed are mainly paper, wood, fibre and cloth. One well-known hanging which claims to be the only material solid both in colour and relief is composed of oxidized linseed oil and wood flour mixed with colours and a few minor ingredients. Another is made by placing wood pulp in moulds to a considerable thickness; others are composed of asbestos, canvas or silk refuse.

H. K. D.

R.I.B.A.

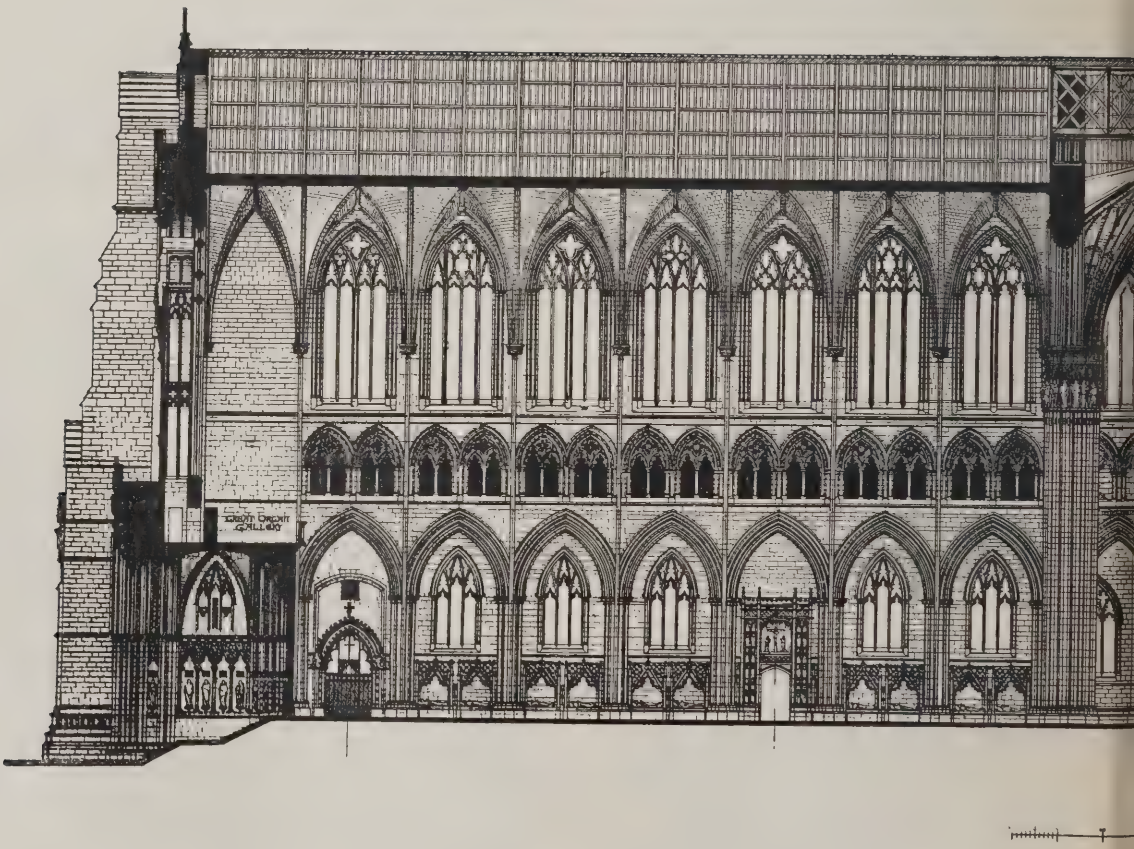
Presentation of the Royal Gold Medal.

THE last meeting of the session of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., when the Royal Gold Medal was presented to Mr. Charles Follen McKim, of New York, for his executed works as an architect. Mr. Aston Webb, R.A., who presided, gave a sketch of his career.

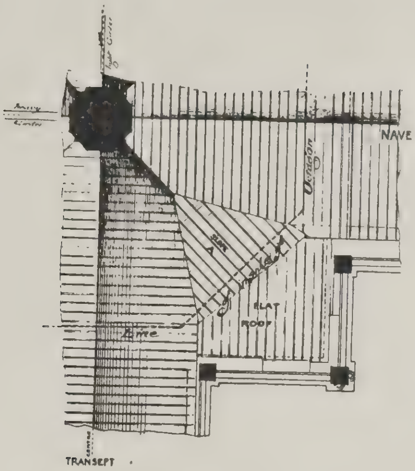
Mr. McKim was born in Chester County, Pa., sixty-five years ago. When eighteen he entered Harvard University, with the intention of becoming a mining engineer, but a year later, finding the work uncongenial, he went to the office of Mr. Russell Sturgis, architect, of New York, and in the autumn of the same year to the Atelier Daumet in Paris, where he prepared himself for the Ecole des Beaux-Arts, subsequently entering it and remaining there till the war broke out three years later. During this time he also travelled in Europe and visited England in 1869, where he was able to make profitable use of his time, "so far as cricket matches, &c., permitted": he was also elected an honorary member of the Architectural Association. Returning to New York in 1870, he entered the office of H. H. Richardson. At the age of twenty-five he commenced practice on his own account, being joined in 1877 by Mr. William Rutherford Mead and in 1879 by Mr. Stanford White—under which title of McKim, Mead & White many commissions were carried out. In 1887 they were appointed architects to the new public library for Boston, now a very famous building. In 1889 two fellowships, known as the McKim Fellowships, were established in the school of architecture at Columbia University. In 1891 Mr. McKim was appointed one of the ten American architects for the Chicago Exposition buildings. In 1894 he was appointed architect to the new capitol building for the State of Rhode Island. In 1897 the American Academy of Architecture in Rome was incorporated, and Mr. McKim elected president. In 1899 he became a member of the Academy of San Luca, and in the same year was appointed to serve on the first municipal art commission of New York. In 1901 he was appointed a member of the commission for the great improvement scheme for Columbia Park, Washington, and in the same year was elected president of the American Institute of Architects, being re-elected in 1902: in 1902 also he was appointed by President Roosevelt to restore the White House, and also as architect for the new Army War College.

Mr. Webb said Mr. McKim's style was based largely on Italian examples and showed French training; it had true artistic feeling, nobility of plan, breadth of treatment, absence of unnecessary or meretricious ornament, and suitability of purpose, and while founded on traditional lines showed just that amount of individuality required, and without which the best work must be dull and uninteresting.

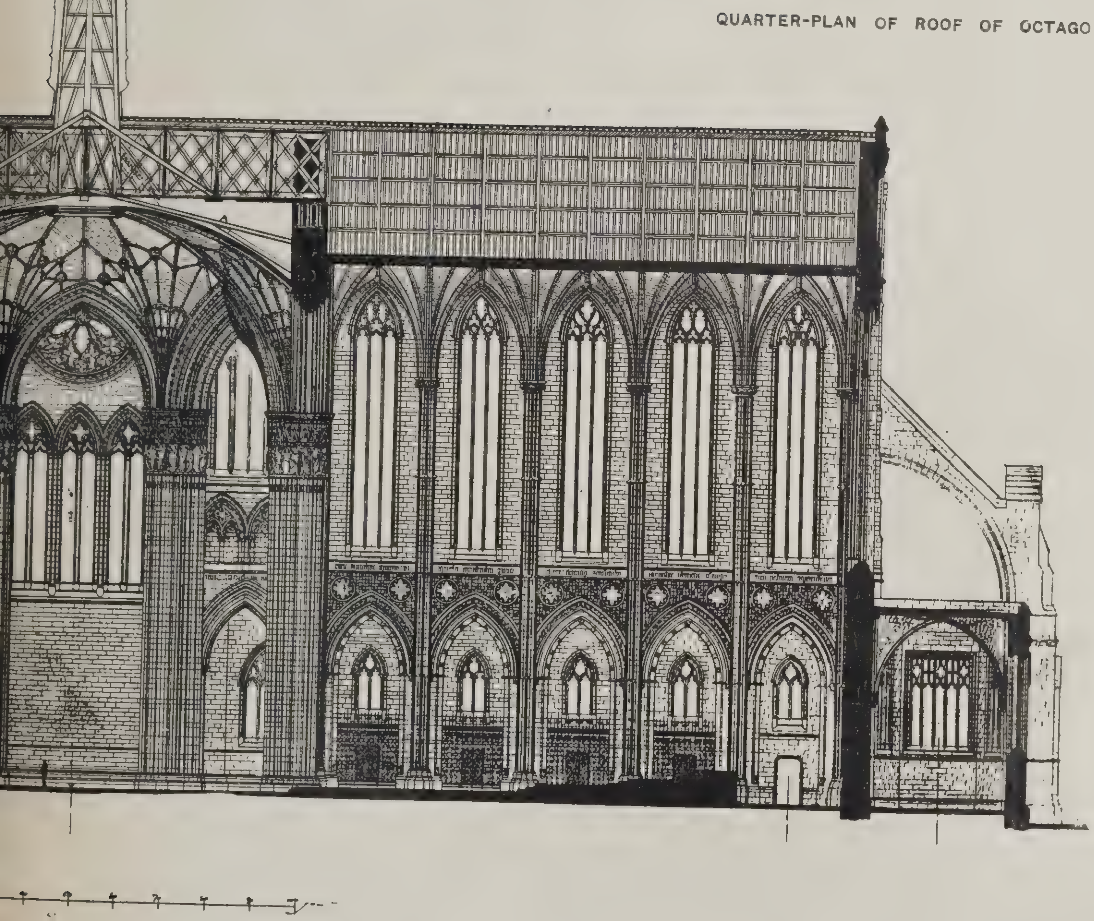
Mr. McKim replied, giving some facts about architecture in the United States, and expressing his appreciation of the honour conferred upon him. The American Ambassador (Mr. Choate), Sir Lawrence Alma Tadema and Mr. Edwin A. Abbey, R.A., also spoke.



DESIGN FOR LIVERPOOL CATHEDRAL BY



QUARTER-PLAN OF ROOF OF OCTAGON.



LM STARK   LONGITUDINAL SECTION.

Keystones.

The Académie des Beaux-Arts has awarded to M. Patrice Bonnat the Prix Deschaumes, 1,500fr., for architecture, and to MM. Déscatoire (sculptor) and Zo (painter) the Prix Tremont, 1,000fr.

The new Library at Dulwich College, erected as a war memorial to the Old Boys who died in South Africa, was opened on Saturday. Mr. Edwin T. Hall, F.R.I.B.A., was the architect.

An Operating Theatre at Kidderminster Infirmary has been erected as the town's Queen Victoria Memorial. A new ward has also been added as a memorial of the late Mr. William Adam, a local carpet manufacturer.

Durham College of Science, Newcastle.—At a recent ordinary meeting of the council Mr. W. H. Knowles, F.R.I.B.A., was appointed architect and Mr. J. P. Allen quantity surveyor in connection with the completion of the college buildings.

The Ruskin Museum, Sheffield.—The annual report states that during the year ending March 25th last the total number of visitors to this museum was 58,335, as compared with 40,580 during the previous year, the average daily attendance being 186. The special exhibit in the new room was a series of original drawings, etchings and mezzotints by Turner. Six public lectures on "The Museum and Treasures of St. George" were delivered.

Mr. Bertram Blount.—With reference to the notification in last week's issue as to Mr. Bertram Blount having removed from No. 2, Broadway, Westminster, to 76 and 78, York Street, Westminster, we are requested by Mr. R. H. Harry Stanger, son of the late Mr. W. Harry Stanger, of the firm of Messrs. Stanger & Blount, to state that he, having succeeded to his father's business, is carrying on the testing works and chemical laboratory at No. 2, Broadway, Westminster, in his own name.

St. Christopher's Church, Derby, just erected in Shaftesbury Crescent, was opened last week. It is in the thirteenth-century style, and is built of brick, with Derbyshire stone facings. The architect was Mr. Ernest Ridgway, of Long Eaton, and the contractors were Messrs. Walker & Slater, of Derby. The organ is by Messrs. Brindley & Foster, of Sheffield. The building is heated by hot-water pipes, the apparatus being supplied by Messrs Danks & Co., of Nottingham. The total cost was between £5,000 and £6,000.

The A.A. and the Westminster School of Art.—The acquisition by the Architectural Association of the premises hitherto occupied by the Westminster School of Art left this latter institution to find a new home. It has now been decided that the art school shall be carried on as nearly as possible on the old lines at the Technical Institute, Vincent Square, Westminster. The old school in Tufton Street will close on June 30th, and the new classes in Vincent Square will open in the middle of September.

A new Congregational Church and School at Little Ilford is to be erected. The tender of £4,435 submitted by Messrs. F. Gough & Co., Hendon, has been accepted. The block comprises a church to accommodate about 724 persons, and the usual vestries, &c.; also a large two-storey school, the main hall being on the upper storey and the classrooms and small hall on the ground floor. The style is Perpendicular Gothic, freely treated. The buildings are faced externally with red bricks, and the dressings are of white Costessey work. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, 5, Clement's Inn, Strand, London, W.C.

Mr. Aston Webb, R.A.—Mr. Aston Webb, the newly-elected Royal Academician, occupies the fauteuil of Mr. Alfred Waterhouse, who recently resigned his place among "the Forty" owing to prolonged ill-health.

The Excavations at Knossos.—Mr Macmillan announces that he has been promised £1,000 towards the completion of these excavations, now being conducted in Crete by Mr. Arthur Evans. But another £2,000 is still needed.

The Worksop, Blyth and Cuckney Isolation Hospital is being warmed and ventilated by Shorland's patent Manchester stoves, Manchester grates, exhaust roof and inlet ventilators, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

The old Parish Church at Nacton, Ipswich, will soon be in the builder's hands for necessary repairs and alterations. It is proposed to put new roofs on the nave and chancel and to remove the small inconvenient chancel arch, placing in its stead a new and larger one. It is contemplated, further, to erect a small north aisle, vestry and organ-chamber, as well as a new porch, and to add a new stage to the tower.

Hull Town Hall Competition.—Mr. John Belcher, vice-president R.I.B.A., the assessor appointed to decide upon the designs submitted for the Hull Town Hall extension, has awarded the first premium of £300 to Messrs. S. B. Russell, Cooper & Davis and C. E Mallows, Gray's Inn Square, London; the second premium of £200 to Messrs. Treadwell & Martin, Waterloo Place, Pall Mall, London; and the third of £100 to Mr. A. Bramwell Thomas, Queen Anne's Gate, London. The designs are estimated to cost £100,000.

The Mosely Industrial Commission to U.S.A.—Mr. A. Mosely has made arrangements with Messrs. Cassell & Co., Ltd., the well-known publishers, for a reprint of the complete reports of this Commission, in cheap form. Copies will be sold at 6d. each nett, or post free 9d. This cheap edition is being produced by Mr. Mosely not only without profit, but at a loss, solely in order that the public may be enabled to possess themselves of the knowledge gained from the enquiries made in the United States. The Board of Trade has ordered 3,000 copies for free distribution.

The Civil Service Commissioners have announced that an open competitive examination for four appointments as assistant civil engineer in the Department of the Director of Works of the Admiralty will be held in July. Forms of application for admission to the examination, together with a copy of the regulations, may be obtained on written request addressed to the Secretary, Civil Service Commission, Burlington Gardens, London, W. The forms of application must be returned so as to reach the Civil Service Commission not later than July 2nd. The salary commences at £200 a year, and assistant civil engineers are eligible for promotion to higher grades.

The Leeds and Yorkshire Architectural Society held its first summer excursion on June 13th, when the members visited the new St. Anne's R.C. Cathedral now in course of erection in Cookridge Street, Leeds. The visitors were met and conducted over the works by the architect, Mr. J. H. Eastwood, A.R.I.B.A., to whom a vote of thanks was accorded on the motion of Mr. Butler Wilson, F.R.I.B.A., president of the Society. The members then inspected additions to Messrs. Spark & Son's printing works, where a new system of fireproof flooring, known as the "Fram," has been introduced into Leeds by the architects, Messrs. Butler Wilson & Oglesby. The party afterwards journeyed to Seacroft, where a new infectious diseases hospital is in progress from the designs of Mr. Edwin T. Hall, F.R.I.B.A.

Builders' Notes.

A Bridge Contract.—The contract for the Rhodesia railway bridge over the Zambesi, which crosses half a mile below the Victoria Falls, has been secured by the Cleveland Bridge Co., Darlington. The bridge, 650ft. long, crosses a deep gorge 360ft. above the water level. The main span is a 500ft. steel arch. There will be a double line of rails.

Employment in the Building Trades, the Board of Trade Labour Department states, remains about the same as a month ago, and is not quite so good as a year ago. The percentage of unemployed trade-union members among carpenters and joiners was 2·6 at the end of May, compared with 2·8 at the end of April and 2·5 in May of last year. The percentage for plumbers was 6·4 at the end of May, as compared with 7·1 in April and 5·9 in May, 1902.

The International Fire Prevention Congress is to be opened in state at 11.45 a.m. on Monday, July 6th, by the Right Hon. the Lord Mayor of London. The Lord Mayor will be accompanied by the Burgomaster of Brussels. The first Congress conversazione will take place on the Monday evening, July 6th. The general and sectional discussions will take place on the Tuesday, Wednesday and Thursday forenoons, July 7th, 8th and 9th. The testing operations and inspections are fixed for the afternoons of these days, and there will be entertainments for the visitors in the evening. The Congress banquet has been fixed for Wednesday, July 8th.

Sir John Mowlem Burt and Mr. George Burt, of Grosvenor Wharf, Westminster, announce that for family reasons they have decided to convert the business of John Mowlem & Co. into a limited liability company, all the shares being held privately, and the change taking effect as and from January 1st, 1903. The management will still remain in the hands of Sir John Mowlem Burt and Mr. George Burt, who will be governing directors. They have associated with themselves as a director Mr. Edwin John Burt, son of Sir John, who has been superintending works by the firm for some years; and as a director and secretary of the company, Mr. James Marsden, who for a long period has been in the confidence of the firm, and has the direction of its official department. These four will constitute the first board of directors.

The Engineering Conference.—In opening the proceedings of the three days' engineering conference held at Westminster last week, Mr. J. C. Hawkshaw, president of the Institution of Civil Engineers, said that during the last two years two great works had been completed—the Nile dams for irrigation purposes and the conveying of water 300 miles in steel pipes to Coolgardie. It was impossible to over-rate the importance of the Engineering Standards Committee, consisting of 296 of the most eminent men in the profession. The work of the various committees was at an advanced stage, and those on building and general bridge construction and tramway rails had been completed. When they had standardized the sections most in use by engineers, and issued standard specifications and standard tests for materials, a great saving to the country would be effected. Then their Institution had been paying great attention to the subject of the training of young engineers, and a committee, under the able guidance of such men as Sir John Wolfe Barry, Sir William White, Sir Guilford Molesworth, Dr. Kennedy, Professor Unwin, Mr. Siemens and others, had done much to increase the standard of efficiency.

Bricks and Mortar.

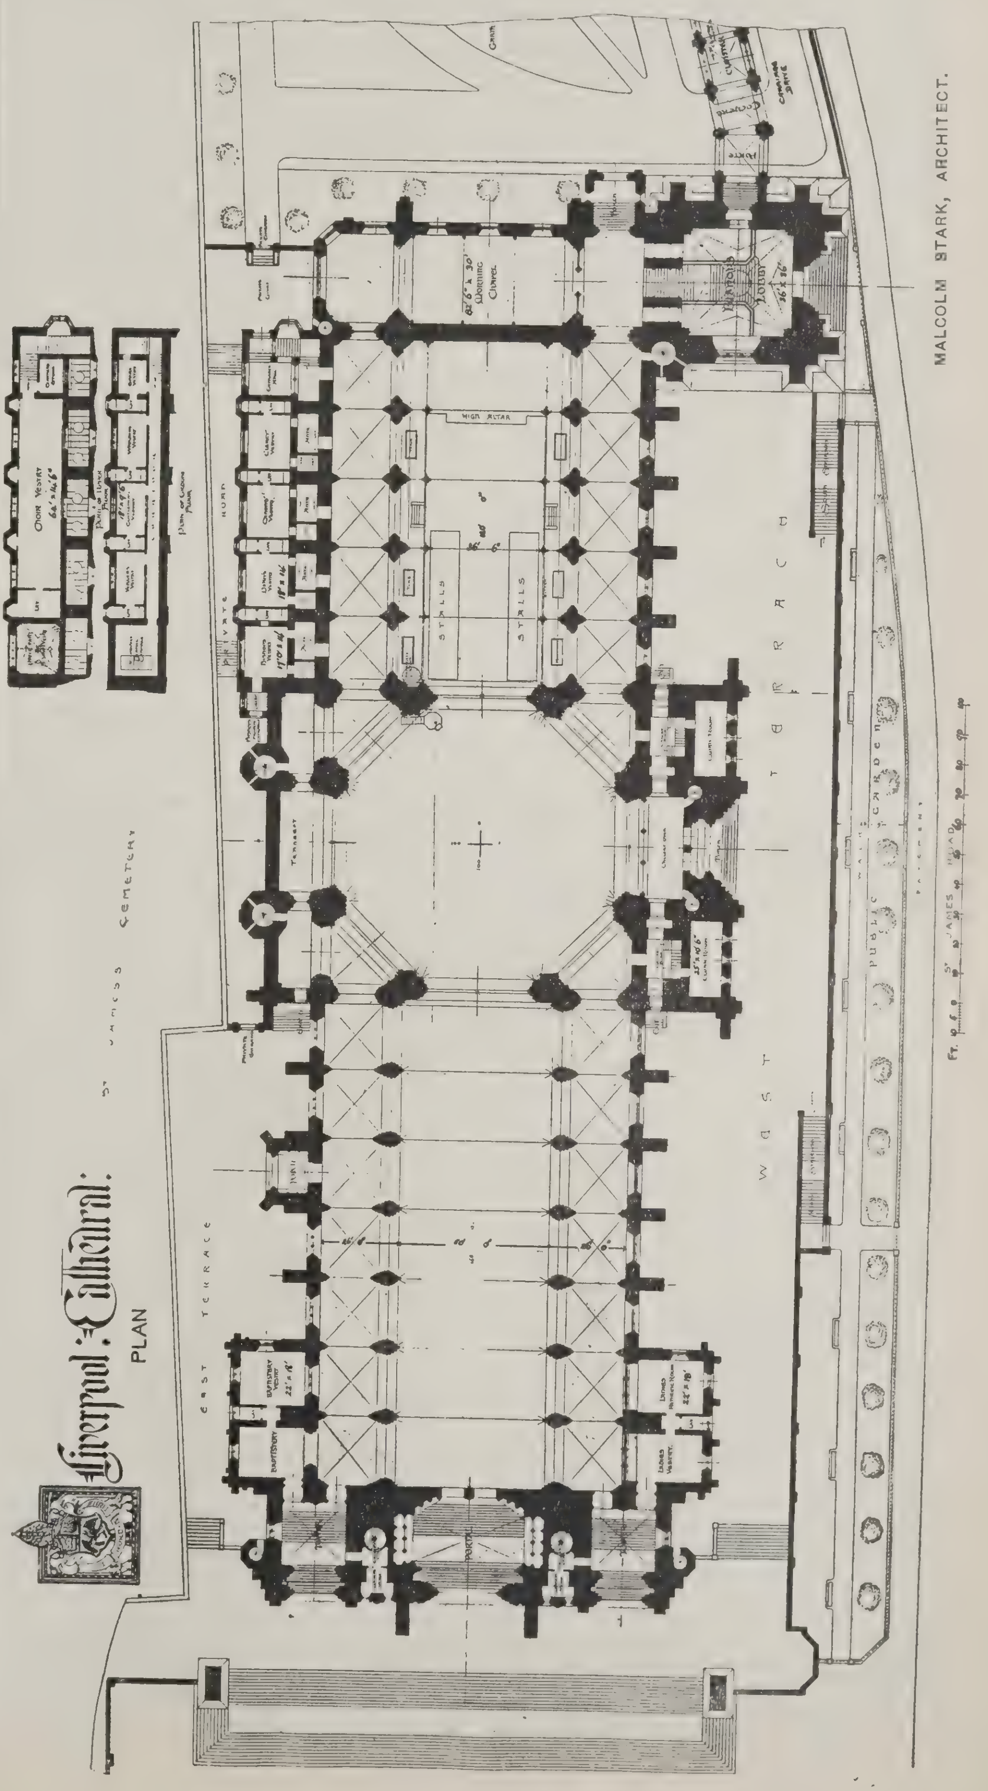
Aphorism for the Week.

It is only in the realization of ideal aims, by means of invention and imagination, that architecture vindicates its claim to rank among the arts.—Basil Champneys.

Our Plates. The Prudential Assurance Company's new buildings are the work of the firm of Messrs. A. Waterhouse & Son, the external design being wholly attributable to Mr. Alfred Waterhouse, R.A. Mr. Waterhouse, however, retired from practice in August, 1901, owing to ill health, and since then the conduct of the whole, together with the design of portions of the internal finishings, has been left entirely in the hands of Mr. Paul Waterhouse, who, on his father's retirement, was appointed by the Prudential Assurance Company to act as their architect.

Richborough Castle. Mr. Charles F. Routledge writes: "There seems to be an increasing desire among antiquaries that further excavations should take place at Richborough and another attempt be made to solve the mysterious problem as to the use of the 'mass of concrete' (145ft. by 104ft., and more than 22ft. deep) which occupies the position usually assigned to the prætorium. The opinion generally received is that this mass was at first intended as a foundation for a gigantic stone pharos, but that (in consequence, perhaps, of some Saxon inroads) a temporary wooden pharos was substituted, of which the cross, now existing on the platform, was the internal buttress or support. But (as Mr. Goddard has lately pointed out) the main sea was then at least a mile from the position of the supposed pharos, and Richborough is called a 'statio tranquilla.' What, then, would have been the use of a large lighthouse there, especially as a small Roman tower (the remains of which have been actually found) at Worth would have better served in that capacity? Why should a lighthouse, needed for an inner bay, have required such colossal foundations? Under any circumstances, it would have been unnecessary and wasteful to make the substructure a solid cube—and we may conclude that in all probability the mass of concrete is hollow. If so, it might have been used as a granary or arsenal, or (as Mr. Goddard suggests) as a great reservoir for the storage of fresh water to be supplied to the shipping below and for the service of the garrison above. Nor can we altogether dismiss as incredible the idea that it may have served as an ærarium, or treasure-house. This is, as I have said, an interesting archæological problem that must eventually be solved; but there are many other portions of the Richborough camp in which excavations are desirable; and I am sure that the trustees would give their consent to such excavations being undertaken under competent superintendence, provided that a sufficient sum of money is forthcoming."

A Casket for Mr. Chamberlain. The casket, designed by Mr. Harry Wilson, the well-known architect, to be presented by the members of the Constitutional Club to Mr. Chamberlain on June 26th, is now on view in the club. The main idea of the design is that of a casket, box or ark borne on the waters of the sea. The pedestal is divided into two stages. On the upper stage are four enamelled ships of different types and periods, typifying the sea power of Britain, while on the angle piers in the lower stage are panels of tribute-bearing kings and queens, emblematic of the land power, past and present, of this kingdom. In the central niche of the front of the casket is a figure of Britannia; a male figure symbolizing Commerce stands on a ship resting in her lap. In the opposite niche is a figure of Peace, also seated, with a garland of olives round her head; she bears a globe on which is a gold map of Africa; in the centre of this is a sleeping figure of Love—the whole symbolizing the restoration of peace. In the end niche are figures of India and Canada. The opposite niche contains figures of Australia and New Zealand. The top of the pedestal is formed by a network enclosing emblems of the four kingdoms, and bears the dedicatory inscription in gold and blue in the centre. On the lid of the casket proper are four panels in translucent enamel. That over the central niche symbolizes Empire, shown as Britannia seated on her island surrounded by her Colonies, imaged as children. Each colony leads a ship by a golden cord. Over the group of Australia is a panel symbolizing the Federation of Australia. Britannia spreads her robe round the infant states of the New Commonwealth. One of the cherubs bears a shield with "Advance Australia," the device of the colony.



Liverpool Cathedral: PLAN

MALCOLM STARK, ARCHITECT.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Patent Sashes.

HULL.—F. S. writes: "Who are the makers of Moline's patent wrought-iron sashes?"

The General Iron Foundry Co., Ltd., 43, Upper Thames Street, London, E.C., or they may be obtained from Messrs. Young & Marten, Caledonian Works, Stratford, E.

Covering Hot-Water Cylinder and Pipes.

RADLETT.—SUBSCRIBER writes: "Does coating a hot-water cylinder and pipes with a non-conducting medium result in an appreciable saving in fuel, and if so, what is the best material to use for the purpose?"

Whether covering the cylinder and pipes with a non-conducting substance would result in an appreciable saving in fuel would depend on many circumstances. Is the water heated in a boiler behind the fire of a cooking range? In this case the fire is usually regulated by other considerations than the water to be heated. What is the length of pipe between boiler and cylinder, and between cylinder and draw-off taps, and to what extent are cylinder and pipes exposed? Speaking generally, there is a great benefit derived in so covering the cylinder and pipes, and doing so will sometimes make an apparatus efficient that was previously a failure. Hair-felt is one of the best materials to use. It is wrapped around the pipes—having previously been cut into strips of convenient width—and around the cylinder, being held in position with string or wire. G. A. A.

Corrugated Iron Buildings.

HARROGATE.—J. T. writes: "I wish to build a bungalow near a brickyard which I hold under a five years' lease. I proposed to build it of corrugated iron, but the urban district council refused to pass the plans under the by-law (Model By-laws) that the material must be incombustible and laid in horizontal courses. I cannot afford to build in brick on so short a lease; besides, the same council have just built a hospital and caretaker's house of the same material. Is there any decision to explain this, and what would be the process in case they decided to prosecute?"

It will be seen by reference to clause 2 of the Model By-laws that a building erected as a temporary hospital for infectious diseases is exempt from the operation of the by-laws. Similarly, Government buildings are not subject to the control of local authorities and are exempt from their by-laws. In some districts the local authorities permit the erection of corrugated iron buildings as dwelling-houses (provided the site is suitable and adequate constructional precautions against fire, &c., are taken); but such a course is discretionary with the local authority, unless the by-laws make provision for the erection of iron buildings of this description. In the case of buildings erected in contravention of the by-laws, the local sanitary authority is required to serve a notice on the building owner calling upon him to show sufficient cause why such work should not be removed, altered or pulled down; and should he fail to show sufficient cause, the sanitary authority is empowered to remove, alter or pull down such work. It then rests with the building owner to take such action as he considers necessary. We think the best course would be to see the surveyor to the urban district council and ascertain from him under what restrictions or conditions the local authority would permit the erection of an iron building for the purpose you propose. If the period of your lease is so short and of such a temporary character that it is not worth while to build with a due regard to health, safety and comfort, then it would be better to abandon the project altogether. T. E. C.

Old Basing House.

BASINGSTOKE.—J. A. S. writes: "Kindly give some particulars of Old Basing House. Are there any records of its original structure?"

The only part of Old Basing House which is now standing is the gateway, built in brickwork, of sixteenth-century date. The house in Cromwell's time, after having stood the longest siege of any fortified place in England—namely, two years—was razed to the ground by Cromwell in person, with his Ironsides. Until quite recently the site was overgrown with grass, when excavations revealed cellars, passages, archways and ovens dating back to between the sixteenth and seventeenth centuries. The building was probably erected on the site of an ancient Norman castle, which was enclosed by mighty British earthworks, second only perhaps to those at Castle Rising, in Norfolk. Probably coeval with Basing House is Basing Church, a brick building in the Perpendicular style. There is no drawing extant of the house, neither are any records known except historical ones of the period. M.

Superheated and Saturated Steam.

WALES.—SANITARIAN writes: "(1) What is superheated steam, and what is saturated steam? (2) What diseases are persons engaged in offensive trades, such as fellmongers, &c., particularly liable to?"

(1) Saturated steam is the term applied to all steam formed in a closed vessel and arising directly from the boiling water with which it is in contact, so that the steam is then in such a condition that it would yield some portion of water on the slighest reduction of temperature or increase of pressure. For instance, the boiling point of water under ordinary atmospheric pressure at mean sea-level is 212 degs. Fahr. (100 degs. C.), but if subject to an additional pressure of 10lbs. per sq. in. the boiling point of water is not reached until a temperature of 239 degs. Fahr. is obtained, whilst at 20lbs. pressure it is 259 degs. Fahr. In the cases mentioned, the temperatures of saturated steam generated under these different conditions are therefore 212 degs., 239 degs. and 259 degs. Fahr. respectively. It will thus be seen that the term saturated steam does not refer to water vapour generated at any one particular temperature or pressure, for steam at any pressure is saturated when it is at the temperature of the boiling point of water for that pressure. Steam which is generated from boiling water at atmospheric pressure is sometimes known as "low-pressure" steam, whilst steam obtained under pressure is known as "high-pressure" steam, but in each case the steam produced is saturated steam, although the respective temperatures vary considerably according to the pressure at which it has been produced. Superheated steam consists of saturated steam which has been raised to a higher temperature than that of the corresponding boiling point of water from which it was originally generated. This result may be obtained by passing the saturated steam through a stove or chamber which is maintained at a higher temperature than the steam as given off from the boiling water. For all practical purposes, superheated steam is a gas, whilst saturated steam is a vapour. In the case of disinfectors, superheated steam is generally obtained by surrounding the saturated steam chamber with a jacket or casing containing steam at a higher temperature than that within the saturated steam chamber. For ordinary disinfecting purposes, however, it is now generally admitted that superheated steam has less penetrating power than saturated steam under similar conditions. Saturated steam generated at about 10lbs. pressure is usually found to give satisfactory results. If required, it is possible to obtain both saturated and superheated steam with almost any well known form of disinfecting apparatus, such as the "Washington Lyon," manufactured by Messrs. Manlove, Alliott & Co., Ltd, Nottingham; the "Equifex" (Geneste & Herscher's patent), manufactured by Messrs. Defries & Sons, 147, Houndsditch, London, E.C., and other similar types. (2) Fellmongers are very liable to skin and parasitic diseases. All persons following occupations of this description should exercise the greatest personal cleanliness and care in their work. T. E. C.

Advanced Building Construction.

CAMBERLEY.—L. M. G. writes: "Your solution to question 29 of the Advanced Stage in Building Construction is not quite clear. I should be extremely obliged if you would explain more fully, and also state where my answer is at fault. The following is the answer I gave: Length of roof-slope = 5ft. The gauge of the sheets is 6in. ∴ 10 sheets will be required vertically. Length of sheet = 2 gauge + lap = 6in. + 6in. + 3in. = 15in. ∴ total length of copper up the roof-slope = 10 × 15in. = 150in. The circumference half-way up the roof-slope = 4ft. × $3\frac{1}{7}$ = 151in.

Area of copper on roof = 150in. × 151in. = 22,650 sq. in. -	22650
Extra on conical cap = (4in. × $3\frac{1}{7}$) × 5in. = 65 sq. in. -	65
Extra on eaves-course = (8ft. × $3\frac{1}{7}$) × 9in. = 2,718 sq. in. -	2718

144{ 12)25433
12)2119·5
176·7

Weight = $176\frac{3}{4} \times 3$ = 530lbs.

Answer 530lbs. approximately."

I begin by admitting an arithmetical error in the area of the average ring of lap; I took it from a diagram, and by mistake used the radius as if it were the diameter. I shall, however, try to be perfectly explicit now. The slope is 5ft.; there are consequently, before the cap is put on, 10 bands of margin from eave to apex; there are therefore 9 rings of lap; at each ring of lap there are three thicknesses of copper; the fifth ring is an average ring; the distance of its centre line from the apex is 2ft. $4\frac{1}{2}$in. = 2·375ft.; its diameter is $\frac{2 \times 2·375 \times 4}{5} = 3·8$ft.; its girth is 3·8 × 3·1416 = 11·94; its area $\frac{11·94}{4} = 2·985$, say 3; the area of the 9 rings is therefore 27 sq. ft. The area of the curved surface of a cone is $\frac{gs}{2}$, where g is the girth at the base and s the distance from the apex to the circumference of the base; in this case $\frac{5 \times 8\pi}{2} = 20\pi$. There are two thicknesses of copper over this area and the additional thickness at the rings of lap.

40π for two thicknesses of copper - - -	125·664
9 average rings, extra thickness - -	27·000
Cap - - - -	·436
	153·100
	3
	459·300lbs.

If you sketch it out you will find that the length of sheet from circumference to apex is 9in. + 8 × 15in. + 12in. + 6in. = 147in. = 12·25ft.; and this multiplied by the girth at base and divided by 2 will give 153·9 sq. ft. (an approximation). Another, but rougher, approximation is to take $2\frac{1}{2}$ times the area: $2\frac{1}{2} \times 62{\cdot}8 = 157$. You are seriously wrong when you add 2,718 sq. in. for extra on eaves-course; there are only two thicknesses under the margin at the eave. Owing to imperfect checking there are errors: In question 23, $d^3 = \frac{b\Delta}{kw\mathrm{L}^4}$ should be $d^3 = \frac{kw\mathrm{L}^4}{b\Delta} = 2{\cdot}025 : p = 1406$. In question 25, instead of 131·8 read 153·8; and this makes bricks in a yard 304, sand 6 bushels, and cement 2 bushels. Note: It may be worth while to point out that if the centre of gravity of the section lines of plates can be accurately found, the area of the plates may be determined by multiplying 12·25ft. by the path of the centre of gravity —its circle round the axis of the cone. The small error in the above approximation arises by its having been assumed that the centre of gravity is at the centre point of the slope. It is not; it is a little nearer to the apex. It is an exceedingly useful thing for practical men to make up Guldin's (or Guldinus') theorems for questions of mensuration of curved areas and solids, and for questions of centres of gravity of lines curved in one plane.

OUR CONTRIBUTOR.

Removing Varnish from Oak Doors.

NORTHAMPTON. — WEEKLY SUBSCRIBER writes: "Which is the best way to remove old varnish from natural oak doors so as to retain the original colour and grain for re-varnishing?"

Any element or agent which is sufficiently caustic to remove (that is to destroy) the varnish is also strong enough to damage in some degree the wood itself, either in colour or grain, or both. "Stripso," a chemical agent, the composition of which is not known to the writer, is a preparation which will effectually remove the varnish and is guaranteed not to injure the wood, but it will certainly raise the grain to some extent. Glasspaper will, however, overcome this difficulty. "Stripso" is manufactured by Messrs. C. Chancellor & Co., of 13, Clerkenwell Road, E.C. H. E.

Buildings to Measure around Monmouth and Ripley.

BIRMINGHAM.—F. E. D. writes: Kindly mention a few buildings around Monmouth suitable to measure."

Though my personal recollection is that the district is architecturally rich, I can find little definite information about it. Ross Church I once sketched, thinking it to be good Decorated work, but have lost the sketch, and, after nearly twenty years, forget the detail. Mitcheldean Church, one of the few with a double nave in the country, has a good roof, and I fancy good windows also. Tintern Abbey and Raglan Castle are both within reach, but it is doubtful whether permission to measure at either place is obtainable. At any rate direct enquiry should be made in advance, enclosing a stamped envelope for reply. G. A. T. M.

HANDSWORTH.—D. E. F. writes: "I should be glad to have some particulars of any building near Ripley, in Derbyshire, suitable to measure."

At Crich, about 8 miles from Ripley, is a church with good Decorated windows. At Pentrich, about 3 to 4 miles away, is a church with some Norman and much Perpendicular work. The five-light east window of this period is particularly worthy of study, being of unique design. At Pinxton, about 8 miles away, is a church, largely restored, with one two-light Decorated window and one debased square-headed window of three lights. At Duffield (9 miles, as the crow flies) is a church containing a considerable amount of interesting Norman work and a good two-light window with pierced trefoil head of the Transition period, Early English to Decorated; besides which there is also some Decorated and a considerable amount of Perpendicular work. M.

Dry Rot

GLASGOW.—A. B. S. writes: "In what issues of your journal did the articles on dry rot appear?"

"Some Notes on Dry Rot" by a specialist were published in our issues for August 22nd, September 5th and September 19th, 1900.

Patent Copper Boilers.

ISLE OF MAN.—SUBSCRIBER writes: "I have for some years specified Marshall's seamless copper boilers, and have found them very satisfactory. But in two or three cases recently the contractors and plumbers have informed me that this particular boiler cannot now be obtained, and that the patentee has ceased to make them. Is this so?"

I know nothing of the boilers referred to or the discontinuance of their manufacture. You should write direct to the patentee, whose address you ought to be able to obtain from some of the contractors who have supplied the boilers to your specification.

HENRY ADAMS.

Pressure in Silo.

NORFOLK. — DOUBTFUL writes: "I have been informed that the pressure on the bottom (constructed at any angle) of a silo for grain is only a small portion of the weight of the contents. Is this correct? Also, what formula is used to find the pressure on the sides?"

It would be impossible without experiment to say what pressure is produced at the bottom of a silo full of grain. If it were any use to get at it, one might suggest that a possible answer would be that the area under consideration, if flat, whether a portion or the whole of the bottom, would be under a pressure due to the weight of a cone of the grain having a base equal to the given area and sides inclined at 60 degs. The pressure on the sides would probably be that due to a wedge of grain having an angle of 30 degs. at the bottom, calculated in the same way as a retaining wall. If the bottom were tapered like a funnel, the pressure on the complete ring would have to be taken supposing it to be surmounted by a cone of the grain as above. HENRY ADAMS.

"Drain" or "Sewer."

HARPENDEN.—A. H. S. writes: "When is a drain a drain and when a sewer? A block of four cottages is to be erected. One cesspool is considered sufficient, and it is proposed to have a common drain as shown on plan (not reproduced). The local authority consider that this would constitute a sewer repairable by them. But as it is never intended to divide up the ground at the back of the houses with fences, and there will be a common path at the back, I consider that the drain can be regarded as wholly within one curtailage, and therefore is a private drain. (1) Are the local authority right, or am I? (2) If the ground at the back were one common yard, would the drain be a private drain? The local authority admit that it would."

We have repeatedly answered enquiries as to what is a drain and what is a sewer—see the long reply on p. 276 of our issue for last week, which covers the ground of this enquiry. See also the report of the deputation which waited on Mr. Long last Friday, given on p. 290 of this issue.

A Norman Tower.—It is proposed to restore the tower and belfry of the fine Norman parish church at Bledlow, in Buckinghamshire, at a cost of about £800.

Views and Reviews.

Books on Architecture and Building at the Patent Office.

About three years ago the Patent Office authorities began to issue their series of sixpenny handbooks containing lists of the multitudinous books in the library. The handbook now before us is the twelfth of the series, and includes all the works on architecture and building construction. With so vast a number of subjects concerned, it is not to be expected that the Patent Office library, extensive as it is, can be as comprehensive in all its sections as the separate collections of the societies and associations: consequently its books on architecture and building are not comparable with those in the Royal Institute library; but they are nevertheless a goodly collection, and have the distinct advantage that they may be pulled down from the shelves by the reader without filling up any forms or making any request whatsoever: for the Patent Office library is open to anyone, and the signing of the book in the entrance hall is the only requirement.

This new handbook comprises 1,344 works (71 serials, 1,273 text-books, &c.), representing about 3,173 volumes. These are arranged under subject headings with the date of each book (so that the latest can be selected at once), and a summary of the headings given in class order. The book will be of great service to those who are able to use the Patent Office library, and will also be found handy for reference by those who do not reside in London.

Subject List of Works on Architecture and Building Construction in the Library of the Patent Office (25, Southampton Buildings, Chancery Lane, W.C.). Price 6d., postage ½d.

Obituary.

Mr. William Gibb, of Craigton, Fintray, Stirlingshire, died last week. Deceased was a son of the late Mr. John Gibb, who was the first to open up and develop the Rubislaw Quarries, Aberdeen. Mr. William Gibb always manifested a great interest in the quarries, and when a limited liability company was formed to carry them on he was appointed a director, a position which he occupied till the end.

Mr. Edward Woods, who was perhaps the oldest railway engineer in this country, died last Sunday week. Born in 1814, Mr. Woods at the age of twenty-one entered the service of the Liverpool and Manchester Railway, then recently opened for traffic, and was soon afterwards appointed its chief engineer. He was chosen president of the Institution of Civil Engineers in 1886, having then been a member for forty years. Mr. Woods also served as president of the Smeatonian Society of Engineers and of the mechanical section of the British Association.

Mr. George Watson, architect, of the burgh surveyor's department, Aberdeen, died last Saturday week at the age of twenty-seven years. Mr. Watson served his apprenticeship with Messrs. Matthews & Mackenzie, architects, Aberdeen, and was afterwards for a short time in the employment of the Aberdeen School Board. He subsequently went to South Africa, where he remained for three years, but at the outbreak of the war, owing to the unsettled condition of the country, he returned to Aberdeen, and had since been in the employment of the burgh surveyor. For a considerable time he taught a class of building construction at Gordon's College. He carried out a number of important works for the Corporation, including the present extension of the fish market and the car sheds at Constitution Street, Queen's Cross and Mannofield.

Law Cases.

Overtime in the Building Trade.—Mr. G. Chamberlain, builder, of 14 and 15, Hall Street, City Road, E.C., was recently summoned at the Worship Street Police Court by a workman named Long for wages, £1 5s. 6d. The plaintiff entered the employment of the defendant on May 20th, no questions being asked whether workmen were trade-unionists or not. Plaintiff commenced work at 2 p.m. and worked till 7 p.m. The next day he worked from 8.30 a.m. till 7 p.m. On the 22nd he commenced at 6.30 a.m., and during the afternoon asked defendant's son if time and a quarter was paid for overtime. Upon receiving a reply in the negative he stated that he could not work after 5 o'clock, and accordingly left at that hour. On Saturday he worked from 6.30 till 12—thus making 28½ hours altogether. When applying at the office for his wages he demanded an extra five-eighths hour, 7d., for the 2½ hours he claimed to be overtime. This the defendant refused, but offered to pay for the 28½ hours at 10½d. per hour, £1 4s. 11d. Defendant declined this, and after a call from the Society's delegate the police-court proceedings were taken. The magistrate held that the rules of the union were not binding on the defendant, and that there was nothing to prove it was a custom of the trade within the meaning of the term as intended by law. He could therefore only give judgment for the 28½ hours actually worked, £1 4s. 11d., no costs being allowed.

PRIVATE DRAINS AND PUBLIC SEWERS.

Deputation to Mr. Long.

LAST week Mr. Long received the representatives of twenty-one metropolitan borough councils, who desired him to get rid of the decision of the Court of Appeal, which had decided that a drain pipe receiving water from two houses became a sewer within the meaning of the Metropolitan Management Act of 1855, by which the burden of reform was taken from the private owner and fell upon the local authority, resulting in an average burden of a ½d. in the £ on the ratepayers of London. Sir A. Rollit, M.P., said the precise point was that where two or more houses were served by way of combination drainage, and where no record could be found in the shape of an express authority by the local sanitary authority, the cost both of maintenance and repair was held to fall upon the authority. They asked the Government to take up this matter. After the Mayor of Battersea, Alderman Cuffin and Mr. H. J. Smith (town clerk of Lambeth) had spoken, Mr. Long, in reply, said there was no dispute as to the facts and, he might almost say, the ridiculous condition of things which had arisen. He was invited to ask Parliament to settle in future—when was a drain not a drain, or when it became a sewer? It was not an easy question to carry through Parliament. But there did not seem any reason for confusion in fact or in law between two things which were so essentially different as a sewer and a private drain. As had been pointed out, this question did not affect merely the local authority and the private owner, but it might seriously interfere with public improvements. Certainly in regard to a sewer which a local authority had to maintain they ought to be masters both as to the situation of the sewer, its construction, and everything connected with it before they should be called upon to be responsible for it, and much less to be responsible for its maintenance. He recognized the existence of a very serious difficulty, and that it could be remedied only by the intervention of the Government. He fully accepted the situation, and asked them to be content with his assurance that he would give to the solution of the matter his most careful and earnest consideration.

THE GRANITE TRADE AND PREFERENTIAL TARIFFS.

A CORRESPONDENT of the "Aberdeen Free Press" points out that amongst business and commercial men throughout the north of Scotland there is perhaps no class to which Mr. Chamberlain's great fiscal proposals will appeal more closely than to those connected with the Aberdeenshire granite industry. Scarcely ten years ago one of the most important branches of that trade was its large export connection with America. At that time, said a prominent granite merchant the other day, it is not too much to say that eleven-twelfths of all the granite work cut in Aberdeen was exported to America. To-day the proportions are reversed—and the work done in Aberdeen for the United States is infinitesimal.

Ten years ago the American tariff was only 20 per cent. on manufactured granite articles. But with McKinley the tariff rose to the unprecedented figure of 40 per cent. That was the first decisive blow to Aberdeen's granite export trade with the United States. There have, it is true, been variations in the tariff since then, but from that first blow the trade has never rallied. In 1894 the notorious McKinley tariff was reduced by 10 per cent., but three or four years ago the tariff on granite imported into the States was increased to the almost prohibitive figure of 50 per cent. The enormous disadvantage Scottish granite merchants labour under because of this can readily be imagined. For every monument of the value of £100 manufactured in Aberdeen, and exported to America, £50 must be paid to the United States Government in addition to the ordinary charges for railway rates and shipping freights. The following statistics giving the value of the granite exported to the United States during the past twelve years show the disastrous effect which the tariff has had on the Aberdeen granite trade—and all the while American goods and tools are being poured in here duty free:—

1891 - - - - - -	£112,382
1892 - - - - - -	123,565
1893 - - - - - -	91,343
1894 - - - - - -	108,570
1895 - - - - - -	88,160
1896 - - - - - -	55,452
1897 - - - - - -	36,915
1898 - - - - - -	26,700
1899 - - - - - -	18,078
1900 - - - - - -	19,081
1901 - - - - - -	18,135
1902 - - - - - -	19,710

Last year, it will be observed, showed a slight increase on the totals of the three previous years, but this, be it said, was due rather to an abnormally brisk season in America than to any actual success on the part of the local granite merchants in combating the American tariff. But for the McKinley tariff, an additional £50,000 might have been distributed in wages by the employers in the granite trade of Aberdeen during the year—sufficient to give employment to 600 extra workmen.

The more favourable tariffs that prevail in the Colonies have induced many connected with the granite trade to consider with at least some small amount of sympathy the proposals for preferential tariffs with our Colonies. On granite exported to Canada the tariff is 20 per cent., to Africa only 10 per cent., and even that last minor sum may be returned after a time on compliance with certain specified regulations.

Electrical Notes.

New Surface-Contact Trams.—At the Bromley Town Hall, Bow Road, last week, an exhibition was given of a working model and a section of tramway line constructed upon the Dolter electric traction system. This is run by surface contact, and the merits claimed for it by the inventor, a French engineer, are cheapness, simplicity and safety as compared with either the conduit or the overhead methods. Wolverhampton is the only town in England which runs surface-contact tramways, although on another system, but in the course of the next few months the "Dolter" will be inaugurated on the borders of London. It has been in use for more than a year on a short length of tramway on the outskirts of Paris for purposes of trial, and has received the formal approval and authorization of the railway department of the French Ministry of Public Works. Each car carries a long iron skate or runner, so suspended that it just touches the tops of a number of iron blocks or studs embedded in the road so as to project slightly above the surface. Each of these studs forms the upper part of a small watertight box or chamber, in which is suspended a bell-crank lever. When the car passes over any of the studs the skate, which is magnetized, acting through the iron of the stud, attracts the lever and so completes the electric circuit. Power is obtained as in the conduit system from a generating station, and passes along an underground cable, and the completion of the electric circuit conducts the current from the cable to the motors in the cars. It is claimed that a line can be constructed at a cost of only £600 a mile in excess of the cost of the trolley installation.

Trade and Craft.

Velvril Paint.

Velvril—the invention of Mr. W. E. Reid, F.I.C., the well-known chemist—is prepared by treating castor oil and nitric acid, and incorporating nitro-cellulose with the product. The Velvril Co., Ltd., of 29, New Bridge Street, London, E.C., after having employed their patent medium for various purposes, are now introducing it as a paint. It contains no lead or linseed oil, is quick drying, and gives a smooth surface; but it is more especially noticeable for its damp-proof qualities, its elasticity and its resistance to acids and noxious gases. For use as a paint "Velvril" is thinned with a spirit to a working consistency, and dries as a tough skin on whatever it is applied to, whether iron, steel, wood, stone or cement. It can be made with metallic colours or in various ordinary colours; it can be washed with antiseptic solutions, and its covering powers compare favourably with oil paint. It has been used by Sir William Armstrong, Whitworth & Co. and Messrs. Vickers, Maxim for lacquering gun shells, and is now being tested by the War Office at Woolwich Arsenal (the results, we understand, having proved highly satisfactory up to the present). A test was made with it at the new War Office buildings now being erected in Whitehall by Messrs. Foster & Dicksee. Here some blocks of Portland stone were painted with "Velvril" and put in contact with very wet breeze-concrete; upon examination after four months the face and back of the stone were found to be quite unstained. The makers draw particular attention to its use as a waterproof covering on the haunch of an arch to prevent percolation and moisture from breeze-concrete staining the stone or going through the masonry. Priming colours are specially prepared as a basis for the finishing coat. The price of the paint is 8s. 6d. per gallon.

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, Builders' Journal, *9, East Harding Street, E.C.*

Abercynon (Wales).—For the erection of a new infants' school at Abertaf Abercynon, for the Llanwonno School Board. Mr. A. O. Evans, architect, Pontypridd:—

D. Davies	£3,760
C. Jenkins & Son	3,700
Knox & Wells	3,400
J. Howells	3,130

Blaenau-Gwent (Abertillery).—For the erection of an infants' school at Blaenau-Gwent, Abertillery, Mon., to accommodate 300 children. Mr. R. L. Roberts, architect, Abercarn:—

D. Davies, Cardiff	£4,692	0	0
E. C. Jordan Newport	3.700	0	0
N. Bagley & Co., Abertillery	3,680	7	3
D. W. Richards, Ltd., Newport	3 635	0	0
A. P. Williams, Crickhowell	3,615	0	0
D. Lewis, Llanhilleth	3,597	0	0
J. Newcombe, Ebbw Vale	3,516	0	0
Gaen Brothers,* Abertillery	3,434	0	0
Smith Brothers, Newport	3,388	0	0

* Accepted.

Cambridge.—For works of sewerage at Grantchester, for the Chesterton Rural District Council. Messrs, Waters & Worrall, engineers, Cambridge:—

Swann Brothers	£4,827	9	8
Wilmott & Sons	3.620	0	0
Oak Building Co.	3.373	0	0
Langley Brothers, Haverhill	3,263	18	7
Jones & Sons	2,954	17	6
Wallace & Innes, Hitchen	2,900	0	0
Rayner Croydon	2,827	12	0
Redhouse	2.769	0	0
Flack,* Russell Street	2,765	10	3
Deards, London	2,650	0	0
Hinkins. Royston	2,382	0	0
Roberts & Co., London	2,235	14	6

[Engineers' estimate, £2,856.] [Rest of Cambridge.]

* Accepted.

Caterham.—For the supply of fire hydrants, &c., to the Caterham Asylum, for the Metropolitan Asylums Board:—

Mather & Platt, Ltd., S.W.	£3.653	0
J Blakeborough & Sons, Brighouse	2,534	17
Shand, Mason & Co., S.E.	2,436	0
Brightside Foundry and Engineering Co., Ltd., S.W.	2,059	0
Merryweather & Sons, Ltd., S.E.	2,048	0
J. & F. May, W.C.	1,970	0
H. F. Joel & Co., and T. Potter & Sons, United, Ltd., S.W.	1,766	0
J. Simpson & Co., Ltd., S.W.	1,670	0
Rosser & Russell, Ltd, S.W.	1,611	0

[Engineer's revised estimate, £1,600.]

Dover.—For providing and laying about 2.300 sq. yds. of Australian hardwood paving (karri or jarrah) for the carriageway of High Street, Dover, for the Town Council. Mr. Henry E. Stilgoe, A.M.I.C.E., borough engineer, Town Hall, Dover:—

Acme Wood Flooring Co., Ltd., N.E.	£1,503	7	6
General Contract Co., Folkestone	1,485	7	0
W. Griffiths,* Bishopsgate Street Without, E.C.	1,413	3	4

* Accepted.

Hughenden (Bucks).—For erection of new stables, Hughenden Manor, for Mr. Coningsby Disraeli, M.P. Mr. Arthur Vernon, architect, 29, Cockspur Street, London, S.W, and High Wycombe, Bucks:—

Nash & Sons	£2,197
Webster & Cannon	2,150
H. Flint	2,100
G. H. Gibson*	2,068

* Accepted.

Ipswich.—For additions to the theatre in Carr Street, Ipswich, for the Directors of the Ipswich Lyceum, Ltd. Mr. Walter Emden, architect, 105 and 106, Strand, London, W.C.:—

H. T. Linzell	£1,490
W. H. Bloomfield	1,400
Grimwood & Sons	1,372
Spencer, Santo & Co., Ltd., Felixstowe	1,350
T. Parkington & Son	1,200

[Rest of Ipswich.]

Ipswich.—For the erection of Wherstead Road Schools. Mr. Thomas W. Cotman, architect, Northgate Street, Ipswich:—

S. A. Kenney	£6.576	0	0
H. J. Linzell	6,317	0	0
F. C. Thurman	6,316	2	5
Grimwood & Sons	6 143	0	0
T. Parkington & Son	6,136	0	0
C. Roper	6,115	10	0
A. Sadler	5,929	0	0
Spencer Santo & Co.	5.750	0	0
E. West	5,699	0	0

Kirkby-in-Furness.—For the restoration of St. Cuthbert's Church tower, Kirkby-in-Furness, for the Executive Committee. Mr. J. Standen-Adkins, architect, 3, Maze Road, Kew:—

J. Hatch & Sons Lancaster	£520	0
W. Waite, Ulverston	413	10
Ashburner, Ltd., Dalton-in-Furness	389	13
J. S. Balderstone, Broughton-in-Furness	388	0
J. S. Balderstone*	370	0
Ashburner, Ltd.*	359	3

* Estimate for reduced scheme.

Leavesden (Herts).—For the supply of fire hydrants, &c., to the Leavesden Asylum, for the Metropolitan Asylums Board:—

Mather & Platt. Ltd., S.W.	£3,147	0
Shand Mason & Co., S.E.	2,520	0
Merryweather & Sons, Ltd., S.E.	£2,148	0
J. & F. May, W.C	2,072	0
J. Blakeborough & Sons, Brighouse	2,070	12
Brighside Foundry and Engineering Co., Ltd., S.W.	1,976	0
W. J. Fraser & Co., E.	1,915	
J. Simpson & Co., Ltd., S.W.	1,816	0
H. F. Joel & Co., and T. Potter & Sons, United, Ltd., W.	1,665	0
Rosser & Russell, Ltd.* 22, Charing Cross, S.W.	1,659	0

[Engineer's revised estimate £1,600.]

* Accepted.

Llandegla (Wales).—For the erection of a chapel. Mr. W. Moss, architect, 2, Temple Row, Wrexham:—

R. Roberts	£1 245
S. Moss	1.200
T. Williams	1,199
J. Harrison,* Coedpoeth	1.180

* Accepted.

London, S.E.—For the foundations of Union Street Parcel Office, for H.M. Office of Works, &c.:—

		Alternative Tenders.

Romford.—For works of sewerage and drainage, or sewerage, drainage and repairs in the following roads or streets, or parts of roads or streets, or on lands in the parishes of Romford and Horchurch, for the Romford Urban District Council, viz.:—Victoria Road (part of), Heath Park Road, Brentwood Road (part of). Ardleigh Green Road (part of), Factory Road, Catherine Road, Hamilton Road, Margaret Road, Salisbury Road, Starling Lane to Brook. Mr. H. Ridge, surveyor:—

J. Meeston, Kensington, W.	£20,153	10	5
Peerless, Dennis & Co., Eastbourne	11,494	5	0
W. Iles, Southend-on-Sea	10,500	15	5
T. Adams, Wood Green, N.	10,276	10	7
G. Bell, Tottenham	10,216	0	0
Free & Sons, Maidenhead	10,148	7	4
W. Manders, Leyton	10,018	3	9
D. T. Jackson, Barking	9,919	2	0
B. W. Glenny, Romford	9.211	4	6
J. Jackson, Forest Gate	9,113	19	0
Wilson, Border & Co.,* Cromer Road, Romford	8,545	5	3

* Accepted. [Surveyor's estimate, £10,021 1s. 5d.]

Southend.—For the erection of eight houses, Camper Road, Southend-on-Sea, for Mr. T. Dowsett, J.P. Messrs. Burles & Harris, architects and surveyors, Southend-on-Sea:—

Smith & Chambers	£5,555
F. E. Woodhams	5,200
R. Elvy	4,846
W. E. Davey	4.440
J. Dowsett	4,380
Whur & Campkin	4,272
C. Wingrave	4,056
Dupont & Co.,* Southend	3,950

* Accepted.

Tredegar (Mon.).—For the erection of a cottage hospital at Tredegar. Mr. E. A. Johnson, F.R.I B.A., architect, Merthyr and Abergavenny. Quantities by the architect:—

Lattey & Co., Ltd., Cardiff	£3,429	19
J. Newcombe. Ebbw Vale	3,193	0
Lloyd & Tape, Barry	3,180	0
Thomas & Sons, Abergavenny	3,150	0
E C. Jordan, Newport	2,870	0
D. J. Vaughan,* Tredegar	2,784	0
W. P. Lewis & Co., Hereford	2,657	0

* Accepted.

West Ham—For making-up the following streets, for the West Ham Borough Council:—Hilda Road (part), Chester Road, Desford Road, Exning Road (part), Kimberley Road, Cheshunt Road and Knighton Road (part). Mr. John G. Morley, borough engineer:—

J. Jackson, Plaistow	£4,462
T. Adams, Wood Green	4.337
W. Griffiths & Co., Ltd, Bishopsgate	4,265
Parsons & Parsons, Ilford	4,032
D. T. Jackson, Barking	3,916
W. Manders, Leyton	3 869
G. J. Anderson,* 26, North Street, Poplar	3,612

* Accepted.

Willington (Durham).—For the laying of a cast-iron outfall sewer and building of tanks, filters and other works necessary for the construction of sewage-disposal works at Willington, near Durham, for the Willington Urban District Council. Mr. J. E. Parker, A.M.I.C E., engineer, Post Office Chambers, Newcastle-on-Tyne:—

G. Wells, Horton	£2,102	19	11
G. Hetherington, Coundon	1,931	2	0
Hardy & Atkinson, West Hartlepool	1,909	16	2
G. H. Bell, Bishop Auckland	1,841	16	8
J. Carrick, Durham	1,808	10	9
J. G. Kirtley, Sunderland	£1,775	0	0
T. A. Turnbull, Rowlands Gill	1,740	0	0
P. Frater, Howden-le-Wear	1,650	0	0
W. & J. Lant,* Dixon Terrace, Darlington	1,500	0	0

* Accepted.

Worcester.—For the widening of Breedon Cross Bridge, for the Worcestershire County Council. Mr. J. H. Garrett, county roads surveyor, Shire Hall, Worcester:—

J. White, jun., Handsworth, Birmingham	£2,173	4	0
A. Kellett & Sons, Ltd., Northfield	1,854	4	9
W. H. Gibbs, King's Heath	1,845	0	0
Currall, Lewis & Co., Birmingham	1,615	16	4

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver.]

During the week ending June 20th sixteen failures in the building and timber trades in England and Wales were gazetted.

J. A. Hollands, builder, Marlow. R.O. June 6th.

C. Harris, builder, Wimbledon. R.O. June 12th.

W. Lloyd, builder, Hereford. R.O. June 12th.

F. Mills, builder, Bexhill. Liabilities £307; assets £540.

E. Howson, builder, Lincoln. Discharge granted, subject to two years' suspension.

C. H. Jackson, builder, Hove. Liabilites £2,599; assets £875.

J. Pyett & Sons, builders and house dealers, Anerley, Surrey. R.O. June 9th.

C. E. G. Day, builder and contractor, Cowden Village, Kent. R.O. June 12th.

J. Davis, plumber and decorator, Havant. R.O. June 6th. P.E., Portsmouth C.C., June 29th, at 11.30.

J. Flanders, carpenter and builder, Newport, Mon. P.E., Newport Town Hall, July 2nd, at 11.

S. Y. Brock & Son, builders and contractors, Alburgh. R.O. June 6th.

J. Gibson, junr., builder, Newburn. First meeting, O.R.'s, Newcastle-on-Tyne, June 24th, at 11.30. P.E., Newcastle C.C., July 9th, at 11.

M. Morris, builder, South Benwell. R.O. June 10th. First meeting, O.R.'s, Newcastle-on-Tyne, June 26th, at 11.30. P.E., Newcastle C.C., July 9th, at 11.

S. Cooper, builder, Kingston and Hampton Wick. Liabilities £5,788; £718 to rank for dividend; deficiency £565.

J. Vernon, builder and contractor, Eaton-by-Tarporley. First meeting, Royal Hotel, Crewe, June 26th, at 10.30. P.E., same, at 11.

R. Peck, builder, Chesterfield. R.O. June 11th. First meeting, Angel Hotel, Chesterfield, June 25th, at 2.30. P.E., Chesterfield C.C., July 17th, at 2.

S. Tucker, builder, Plymouth. R.O. June 11th. First meeting, 6, Athenæum Terrace, Plymouth, July 6th, at 11. P.E., East Stonehouse Town Hall, July 7th, at 12.

J. A. Harris, builder, Bristol. R.O. June 11th. First meeting, O.R.'s, Bristol, June 24th, at 11.30. P.E., Bristol Guildhall, July 3rd, at 12.

R. B. Powell, builder and decorator, Finsbury Park, London, N. R.O. June 11th. First meeting, Bankruptcy Court, June 29th, at 11. P.E., Bankruptcy Court, July 24th, at 11.50.

E. J. Charles, builder and contractor, Moseley. Liabilities expected to rank for dividend, £10,949. Debtor estimates a surplus of £23,000 from securities, but this entirely depends on his estimate of £35,000 for an arcade at Wolverhampton being realized.

The following companies are to be wound up:—

Argillite Slab Co., Ltd., Cardiff. E. S. Trezelles, 18, Cwrt-y-vil Road, Penarth, liquidator.

Transparent Art Painting Development Syndicate, Ltd.

A new Wesleyan Church at Sherwill is being erected at a cost of about £400. Mr. A. Lauder is the architect and Messrs. Cooke & Sons, of Barnstaple, are the builders.

At the Church of St. Mary, Charlton Kings, an oak screen has been placed in the south transept. Mr. W. H. Fry executed the commission in less than six months.

THE LONDON

OF OUR

FORE-FATHERS

is rapidly disappearing, and many picturesque bits of Old London have already been demolished to make room for modern requirements.

The following Photogravures (reproduced by the Rembrandt Process), from originals by Mr. F. L. Emanuel, form a lasting record of many of these interesting buildings.

No further copies can be published, as the plates have been destroyed, and the pictures are therefore quite unique.

Single Copies at the following Prices :—

1. **The "Old Horse and Groom,"** Back of Holborn - above - Bar (since demolished).	6d. each.
2. **Holywell Street,** from St. Clement Dane's Church (since demolished).	2s. 6d. each.

THE
BUILDERS' JOURNAL
AND ARCHITECTURAL RECORD.

July 1, 1903. Vol. 17, No. 438. 9, East Harding Street, E.C.

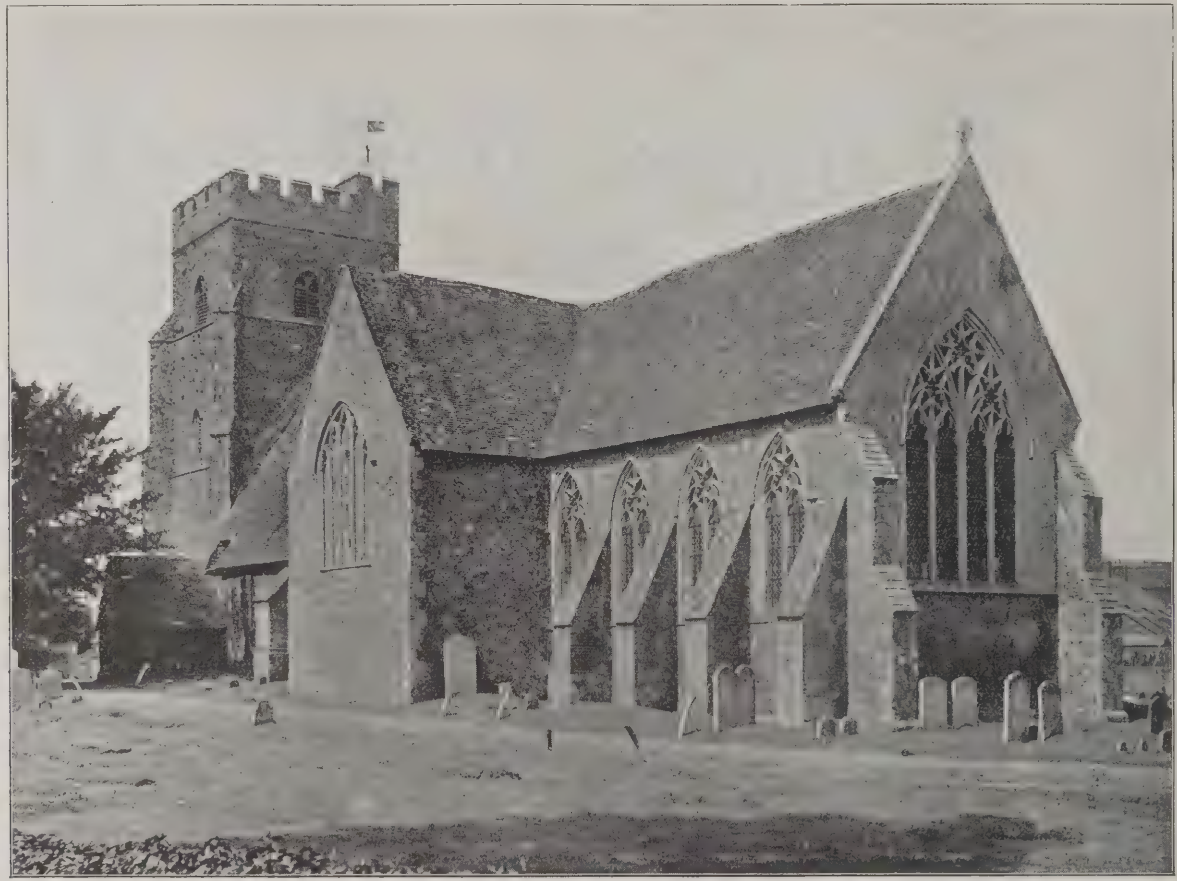
The Building Trade in South Africa. An emigrants' information branch has been opened at 96A, Victoria Street, Westminster, S.W., under the auspices of the Agent-General for the Cape of Good Hope, and as the direct outcome of Sir Gordon Sprigg's wishes This branch is in the charge of Mr. Lewis Atkinson, through whose courtesy we are able to give some first-hand information in regard to the building trade in South Africa. Let it at once be stated that in Cape Colony at the present time there is an urgent demand for all building operatives. Master-builders in Cape Town, Port Elizabeth and in up-country settlements—such as Johannesburg (the ratable value of which is now £36,500,000)—are badly in need of men. The emigrants' information branch above mentioned is in weekly communication with its labour bureau at Cape Town, and we are informed that between seventy and eighty carpenters are now required in Port Elizabeth by the Master-Builders' Association, and also seventy-five carpenters for the Cape Government railways. The latter is an especially good opportunity. The wages are from 11s. to 12s. a day, and the hours 48 per week—overtime is allowed for at the rate of time and a quarter for the first two hours, after that (and on Sundays) time and a half. A third-class free passage out is given, with half-pay on voyage; the agreement being for one year, and the Government having the right to extend it for another two years. If men are incompetent or are dismissed for misconduct they are required to refund the passage money and the half-pay on voyage. In the usual cases of men wishing to go to South Africa, the Government provides a passage for eight guineas (which is two guineas less than the shipping companies' rates), requiring them—if they have no capital—to deposit five pounds with the shipping company, which enables them to obtain from the Agent-General a permit to land, and in producing their letter of credit at the port the shipping company refund to them the £5. It will thus be seen that the Government is doing all it can to encourage emigration to the Cape—that is, the emigration of Britishers, who shall find employment rather than Poles, Russian Jews and other foreigners. We have already said that the demand for workmen is immediate, because the great building boom is only just commencing, and hundreds of houses are being erected as the settlement of the country proceeds. From the figures given it will be seen that a carpenter, for example, can earn about £3 10s. a week, which is very good pay when, on the computation of Mr. Atkinson, he can live comfortably—board and lodging—for 25s. a week. As for architects' prospects in South Africa, we have on previous occasions stated that there are many men already on the spot who are familiar with all the local conditions, having been in practice before the war, and consequently architects fresh from this country would have much to learn: but we are informed that there is a substantial demand for draughtsmen and assistants. It should be clearly understood, however, that there is practically no likelihood of engagements being obtained by letter from this country—young men must go to the colony and make personal application, never fearing that if they have any grit they will find profitable employment. Still other openings are afforded to builders' merchants and makers of brick and quarry machinery. With characteristic backwardness British makers are allowing Americans to look after these interests; and in this connection we would mention that by far the best results are secured by sending a representative from this country, instead of leaving matters to an agent who pushes most those things which pay him best. It is interesting to note that building regulations are now being more stringently enforced in Cape Colony. At Kimberley it is no longer permitted to erect houses of corrugated iron alone: at Cape Town sandstone from Saldana Bay and granite from the Paarl are largely used.

———

The Wellington Memorial THE plaster cast on which Mr. Tweed has been working for some time is now in position on the Wellington memorial in St. Paul's Cathedral—under the second arch from the dome on the north side of the nave. The cast was taken from Alfred Stevens's original full-size model which was so disgracefully hidden in the vaults of the cathedral. This original model was deficient in two details—the tail and one of the hind hoofs—and it was to supply these deficiencies (which, however, are shown on Stevens's small sketch model, now at South Kensington) that Mr. Tweed was engaged by the private committee which forestalled Sir Edward Poynter. It will be remembered that the selection of Mr. Tweed for the task gave rise to a burst of disapproval from certain quarters, and it was largely to set that criticism at rest that the committee decided to have the finished model placed in position on the summit of the memorial. The model was brought to the cathedral last week, and actually placed in position two days ago. At present it is hidden by the scaffolding, but when this has been taken down it will be possible to form a correct judgment of Mr. Tweed's work, in comparison with the original model and Stevens's sketches, which we understand are to be placed beside the memorial so that everyone may see exactly what has been done by the living sculptor to the great work of a dead master.

———

Prof. Petrie's Latest Discoveries. PROF. FLINDERS PETRIE, the doyen of Egyptologists, announces further discoveries at Abydos. In a depth of about 20ft. below the old temple site no fewer than ten successive temples, ranging in age from 5,000 to 500 B.C., have been brought to light. In a letter to the "Times" Prof. Petrie says: "To separate these buildings was an affair of anatomy rather than spade work; the walls of mud brick were so commingled with the soil that incessant section-cutting with a sharp knife was the only way to discriminate the brickwork. Often only a single course of bricks or a thin bed of foundation sand was all that told of the great buildings which had existed here for centuries. Over 5,000 measurements were taken for the plans and levels . . . . . The discoveries of the civilization of the first dynasty, the beginning of the kingdom, expand what we already had from my work in the Royal Tombs. Of Menes, the founder, we have part of a large globular vase of green glaze with his name inlaid in purple; thus polychrome glazing is taken back thousands of years before it was previously known to exist. The free use of great tiles of glaze for wall coverings shows how usual the art was then. In the highest art of delicate ivory carving there are several pieces of this age; especially the figure of an aged king, which for its subtlety and character stands in the first rank of such work, comparable to the finest carvings of Greece or Italy. We must now reckon the earliest monarchy as the equal of any later age in such technical and fine art. Pottery of forms and material quite unknown in Egypt also belongs to this remote age; and it proves to be identical with that in Crete of the late neolithic age. . . . ." Everyone who has followed Prof. Petrie's splendid excavations in Egypt will be eager to visit the collection which is to be exhibited at University College, Gower Street, W.C., from July 1st to the 25th.



CHARTHAM CHURCH.

Views and Reviews.

Canterbury.

This book has been published by the Canterbury Chamber of Trade with the assistance of the Corporation. It is very fully illustrated from excellent photographs; indeed, the book is perhaps most acceptable for these illustrations, which form such a pleasant record for those who are familiar with the city and are such exact guides to those who have never visited it; but the letterpress is none the less interesting, the cathedral having been dealt with by the late Dean Farrar; St. Augustine's Abbey and St. Martin's Church by the Rev. Charles F. Routledge, M.A., F.S.A., honorary canon of Canterbury; and the rest of the volume edited by Mr. Sebastian Evans and Mr. Francis Bennett-Goldney, F.S.A., honorary director of the Royal Museum at Canterbury.

Canterbury has of course a history going very far back. As a Roman town—Durovernum—it was of considerable importance, more especially from the fact that here the roads met from the three Kentish fortresses Richborough, Dover and Lymne, whence the great military road—Watling Street—stretched out into England. But Canterbury is more famous as having been the gateway of Christianity in Britain—the nucleus of the church, its influence so increasing as to become the primate's see, culminating with the beautiful cathedral. With a history going so far back it is only natural that many ancient relics are to be seen in its buildings.

Dean Farrar has told the history of the cathedral in a manner interesting to the layman and to the architect—of its very early foundation, the destruction by fire of several succeeding churches, the rebuilding by Lanfranc about 1077 and later by Ernulf, who re-erected it "so much more splendidly," says William of Malmesbury, "that nothing like it could be seen in England for the lustre of its glass windows, the brightness of which attract the wondering eyes to the summits of the vaulting." But before fifty years had passed (*i.e.*, in 1174) the fabric was again destroyed by fire. The work of rebuilding was undertaken by William of Sens, who, however, fell 50ft. from a scaffolding and injured himself so severely that he was obliged to resign his task to another—William the Englishman. The choir and east end of the cathedral and the upper part of the exterior walls are by these two men, being Transitional work. "Of previous work, besides the fragments of pre-Norman architecture in the crypt, we have Lanfranc's plinth and small blocks of Caen stone worked into the walls in the nave and western transept; the foundation piers of the central tower in the crypt; a door in the east cloister, and above it three windows of the old dormitory. Of Prior Ernulf's and Conrad's work (1026–1106) we have the round-arched masonry of the crypt, parts of the outer walls, of the Dark Entry (famous for the ghost of Nell Cook), and of the monastic kitchen. Of later Norman work (1135–1145) we have the transept towers, the lavatory tower (the so-called baptistery), the treasury, the earliest example of diagonal rib-vaulting, the Green Court gate, the Norman staircase, and the remarkable sculptured ornament of the alternate shafts and capitals of Prior Ernulf's columns in the crypt." Then came the Early English work—including the "Chair of Augustine"—Henry of Eastry's stone screen across the choir (of the Decorated period and formerly painted in bright colour), the Perpendicular nave and cloisters (the latter originally erected in the Early English style), the central tower—also called the Angel Steeple and Bell Harry Tower (built 1495–1503)—Christ Church gate (1517), &c.

The ruins of St. Augustine's Abbey, though fragmentary, are of unique interest, and the excavations are still being carried on there under the superintendence of Mr. Sebastian Evans and Mr. George Hubbard, the consulting architect to the city. It is worthy of note that a missionary college stands on the site, having been designed by Butterfield, who incorporated the ancient remains with his own work.

Another ecclesiastical foundation of great interest is St. Martin's Church, the subject of never ending controversy on account of its many features attributable to Roman or Saxon days.

Canterbury, indeed, has so many interesting buildings that we cannot attempt to mention a tithe of them—the city walls (mostly of the fifteenth century), the Guildhall, Marlowe's birthplace in St. George's Street, the castle, St. John's Hospital, &c. Round about are numerous villages with other buildings of interest—such as the churches at Hackington, Harbledown, Thanington, Chartham (the windows of which are fine examples of the transition between the Decorated and Perpendicular styles), Chilham, Charing, Fordwich and Barfreston: all of which are dealt with in this book.

"The Ancient City of Canterbury." Published by Cross & Jackman, Canterbury. Price 1s. with stiff paper covers and 2s. 6d. in cloth; postage 5d. extra. Copies free to public libraries, hotels, steamships, &c.

A new Technical Dictionary.

"In these days, when people want to do things rapidly, it is frequently impossible, without undue labour, to go to original sources for one's knowledge. For the sake of saving time, we are therefore driven to consult books of reference. This becomes specially necessary in the case of technical terms; and I have no doubt there is a field of usefulness for a dictionary which will explain their meaning." We can readily endorse these introductory words by Mr. Cl. Le Neve Foster, D.Sc., F.R.S., professor of mining at the Royal College of Science, London. With the first part before us, we are able to form an opinion of what the dictionary will eventually amount to. The definitions are concise and clear and range over a wide field. It will serve our purpose to state that this first part includes definitions of "Abyssinian wells," "access pipe," "air-tight stoppers," "Albolite cement," "alternating valve cistern," "artificial stone" and "bacterial contact bed," so that it will be of use to architects, surveyors, sewage engineers and others. The book is printed in very legible type and is illustrated. It will be issued in eighteen parts, price 2s. nett. each.

"The Technical Dictionary-Cyclopædia," edited by Philip R. Björling, C.E., and Frederick T. Gissing, M.I.P.S. London: Rebman, Ltd., 129, Shaftesbury Avenue, W C.

New Edition of Stephenson's "Estimating."

The chief reason why this book is so much to be recommended is—that the author has set about his task in the only proper way, by taking the cost of materials and labour on each item and so arriving at the total estimate, adding the profit afterwards. The prices in this new edition have been carefully revised in accordance with the continued increase in the cost of building, and the book is thus made thoroughly trustworthy and up-to-date. It is practically the only book on the subject.

"Estimating: a Method of Pricing Builders' Quantities for Competitive Work," by George Stephenson. Fifth Edition. London: B. T. Batsford, 94, High Holborn, W.C. Price (reduced) 4s. 6d. nett.

Some Old Doorways.

This book makes an acceptable addition to one's library not only for the seventy collotype reproductions from Mr. Davie's excellent photographs but also for the accompanying letterpress and sketches by Mr. Tanner. It is evident that the photographs first suggested the issue of the book and that the letterpress was invited later to "carry" them, a difficult task which Mr. Tanner has executed with considerable skill, so that the matter, instead of being a disjointed series of archæological notes, runs well together. Mr. Tanner has exercised his critical faculty a great deal in considering these doorways, and we must say that his criticism is very acute and reasonable. The doorways

THE NAVE OF CANTERBURY CATHEDRAL LOOKING EAST.

CANTERBURY CATHEDRAL FROM THE NORTH SHOWING THE NORMAN LAVATORY TOWER.

illustrated date from the sixteenth century to the time of the brothers Adam, including those to simple brick houses, to larger town and country residences, and to mansions such as Hatfield and Aston Hall. First come examples in which the Gothic tradition still lingers, finding uneasy expression in the new style so fresh from Italy; then, when masters like Inigo Jones had set a great example, follow more homogeneous designs; then doorways of still better proportions—such as that to the Conservative Club at Lewisham; later the shell porch, and so on to the days of the Adelphi. In reading the letterpress it is easy to turn to the plates and to follow the writer's observations—a most desirable feature—besides which we must commend the publisher for having inserted Mr. Tanner's sketches in the midst of the matter relating to them. The book will be prized by all interested in architecture, forming a pleasant record of much beautiful work.

"Old English Doorways" illustrated from photographs by W. Galsworthy Davie, with notes and sketches by H. Tanner, junr., A.R.I.B.A. London: B. T. Batsford, 91, High Holborn, W.C., price 15s. nett.

Another Book of Lettering.

We cannot recommend this book of lettering. Besides the usual styles employed by architects, engineers and others, it contains twenty-two "ornamental" alphabets, the majority of which are ugly and ill-formed.

"Lettering for Architects. Engineers. &c.," compiled by John B. Thorp. The London Drawing and Tracing Office, 58, Gray's Inn Road, W.C.

Two Books on House Planning.

Mr. Batsford has just published two volumes which deal with the planning of houses, one devoted to proposed designs for suburban houses, the other illustrating a number of executed designs for country houses. In the former the author, Mr. Snell, attempts to improve upon the plans and elevations of that enormous class of English houses known as "suburban houses." It is doubtful whether the volume ought to have been published at all, for though the plans occasionally exhibit points of interest, on the whole they are essentially bad, while the elevations are as atrocious as the worst of the speculative-built houses of this class. It is, of course, next to impossible to get an ideal plan on such sites, generally enclosed on both sides, as are given to these small houses in the suburbs, and every design must be largely a compromise. They cannot have that simplicity of arrangement which betokens a masterly plan, while aspect or the placing of wall on wall and void on void cannot as a rule be considered. The problem therefore comes down to the juggling of a number of rooms together and the sacrifice of small facilities to essential needs. Cost is an ever-present governing factor. But there is not the slightest reason why angles should be cut off rooms when the extension of a back-addition by a foot or two would avoid it, as in plates II., IV., V. and VII. of Mr. Snell's book, or why walls should suddenly break back a few inches or a foot for a similar reason, as in plate III. Chimneys should always be collected where possible for reasons of economy, of money and of warmth, and the roof-plan made simple for the same reasons—points in which these plans are abundantly at fault. A matter which seems generally overlooked is that the light should come on a kitchener from the side (best from the left, as most persons are right-handed), or still better from a top-light, and there is often no logical reason in these plans why this should not be done. Another consideration of the utmost importance is that there should be unencumbered wall-space in bedrooms in a position not subject to draughts, and if possible not visible when the door is open, for the placing of the bed—another point wherein these plans are at fault, as indeed are those of the majority of architects to-day. In looking at most architects' plans for small houses we realize the reasons why the mere fact of engaging an architect immediately increases the cost; for, unlike the speculative builder, he has had no experience in the saving of every penny, and he plans in a happy-go-lucky fashion with his eyes mostly on the elevation—cutting the roof plan about, designing chimneys isolated far apart, and often adding an extra staircase, while wall does not come on wall and roofs are of large span—all meaning additional expense. It is not to be traced to the fact that an architect requires better work—this is of minor consideration; it is his unpractical methods of planning.

We turn with pleasure from the consideration of this book to that by Mr. Newton, who is a practical architect and one of our most able designers of country houses. The illustrations are excellent; we have never seen any better produced, though some of the photographs are not as good as they might be. Mr. Newton's first publication of the sort, brought out in 1890, soon went out of print, and instead of publishing a new edition of that volume he has issued this selection of country houses planned by him during the last ten years. In the former book, except for plans, the illustrations were entirely from photographs, but in this book the difficulty of obtaining them is not to be greatly regretted, for there are a number of fine perspective drawings instead. Mr. Newton is not an extremist; he says—"It would be affectation to insist nowadays on the use of local materials only, but it is, I think, legitimate to take the district into consideration. Materials foreign to the country side are often imported for no better reason than that the architect has a habit of design and an inelastic mind. We must, too, get rid of the idea that we can compel materials to assume any shape we like, in defiance of their idiosyncrasies. Our house building ought to develop naturally." Not only is Mr. Newton a remarkably able planner, but his elevations and detail work are most charming. His means are quite simple, and gain thereby effective strength. His plans are worthy of the closest study, and are often model solutions of the problems, with every general principle exactly fitted. If we have any criticism to make it is that his plans suffer, as nearly all plans by English architects do, from a somewhat haphazard grouping of rooms, and have no general scheme which makes the arrangement apparent at once, such as in the plans by the brothers Adam or in the best modern French or American plans. A point often overlooked by Mr. Newton is the provision of wall-space for the bed, as dealt with above.

"Modern Suburban Homes: A Series of 18 distinct designs for small and medium-sized houses," by C. R. Snell, M.S.A. London: B. T. Batsford, 94 High Holborn, W.C., price 7s. 6d. nett.

"A Book of Country Houses, comprising 19 examples, illustrated by 62 plates," by Ernest Newton. London: B. T. Batsford, 94, High Holborn, W.C., price 2's. nett.

SMOKE ABATEMENT.

A Proposal to Tax Chimneys.

IN the course of a paper on "Smoke Abatement" which he read before the recent Engineering Conference Mr. G. T. Beilby, A.M.I.C.E., said:—

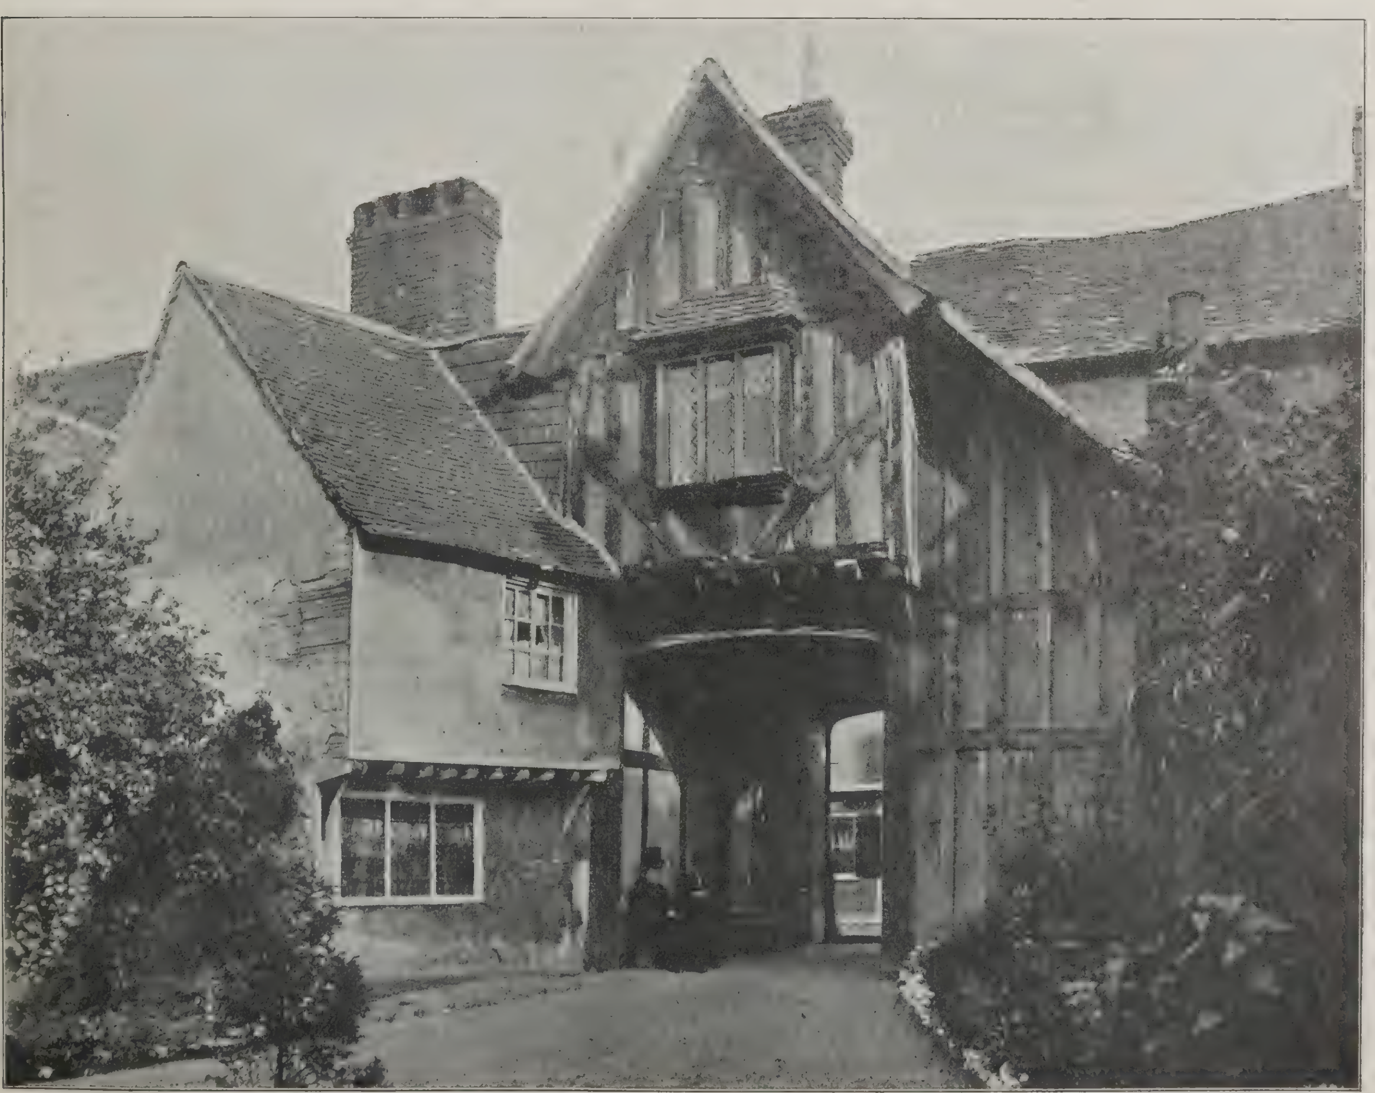
The consumption of coal in domestic fires is about thirty-six million tons per annum. This huge consumption is so completely spread over the whole nation that it may safely be said that there is not one individual in the population of forty millions who is not directly interested in it. It is this fact which makes the domestic problem in many respects harder to solve than the industrial. To the manufacturer we can hold out as an inducement to make an end of his smoke the hope of a handsome premium in the shape of savings on his bill for fuel and power; but for the householder there is no such premium. True, the saving in the cost of cleaning and re-decorating the house and the reduction in the laundry bill would represent no small amount for the average family, but at present the means whereby these desirable savings may be effected are somewhat vague and uncertain, and are supposed to involve a serious initial outlay.

If the direct inducement for the householder to abolish his smoke is insufficient to overcome his inertia and conservatism, it is clear that pressure must in some way be applied from outside. The following are three ways in which this might be done—by a great and permanent rise in the price of coal, by prosecution and fining, and by the imposition of a tax on the burning of smoke-producing fuels. As to the first, there is no likelihood that the price of coal will rise to a point which would compel the householder radically to alter the whole practice of domestic heating; it may therefore be dismissed without consideration. For the second method, that of legal conviction, there is little that is favourable to be said. One effect of the extension of this method from the industrial to the domestic department would be to direct increasing attention to all sorts of patent grates and other nostrums, and to divert it from the broad fundamental proposition, namely, that bituminous coal cannot be uniformly and systematically burned in open fires without smoke. I am well aware that there are good grates as well as bad, and that wonderful efficiency and economy can be secured by the skilful designing and setting of domestic grates, but there are two permanent conditions which make it improbable that any large measure of success will be obtained in this direction. These are the irregularity in the quality of the coal consumed and the dependence of the performance of any grate on the skill and judgment of the person who fires it. The domestic grate is at the mercy of a larger and more varied selection of incompetent stokers than any other coal-consuming appliance! We are driven, therefore, to the third means of applying the necessary pressure, namely, the imposition of a tax on the consumption of smoke-producing fuels.

I venture to suggest that a chimney tax might be so applied as to stimulate and encourage the widest and most radical improvement in domestic heating. Tax every chimney which is sufficiently wide to vent the products from the burning of raw coal, and leave free all those which are too small to do this. This would at once place a premium on the use of smokeless fuel, as gas and coke can be satisfactorily burnt with very narrow chimneys. The production of these forms of fuel would be enormously stimulated, and the devising of appliances for their combustion would be encouraged. The architect and the engineer would have a new and fruitful field for their ingenuity and skill, and their trained efforts would in a short time greatly advance our practical knowledge of the subject.

At present the 9in. chimney holds absolute sway, and a house built without its full complement of these chimneys is looked on as abnormal and outside of the ordinary practice of those who buy and sell or who lend money on house property. The builder, therefore, declines to build houses which are really adapted for smokeless firing by gas or coke, with the result that these fuels have never had a chance of showing at their best. If there is a really serious intention of dealing with the question of domestic smoke, I believe it must be somewhat on the lines here indicated.

Taking the coal output of the United Kingdom at the round figure of 220 million tons and the exports as 60 million tons, there remain for home consumption 160 million tons; of this it is estimated that 36 million tons are burned in about 8 million inhabited houses. At the rate of two working chimneys per house a tax of 1s. per chimney would yield £800,000.



ST. JOHN'S HOSPITAL CANTERBURY: THE GATEWAY FROM WITHIN

THE OLD TOWN HALL AT FORDWICH.

LONDON COUNTY COUNCIL.

At last week's meeting of the Council recommendations were agreed to in favour of application to Parliament for powers enabling sanitary authorities to require the cleansing or destruction of filthy clothing; to require owners to strip the walls and cleanse rooms infested with vermin (owners to recover the cost of the work from tenants in certain cases); to require the reconstruction or removal of urinals opening on to the street and constructed before the Public Health (London) Act, 1891; to make by-laws requiring the paving of stables with impervious material; and to require the removal of fixed dust receptacles after movable receptacles have been provided.—It was also agreed that application should be made in the next session of Parliament for power to enable the Council to spend a sum not exceeding £500 a year in scientific investigations relating to the public health—The Bridges Committee recommended:—(*a*) That the engineer be instructed to prepare the necessary plans, specifications, &c., in connection with the superstructure of new Vauxhall Bridge; that an expenditure not exceeding £250 for reproducing the drawings be sanctioned. (*b*) That a clause be inserted in the specification providing that all iron and steel materials shall be of British manufacture only. Considerable discussion arose upon these recommendations, especially in regard to the last, so that an amendment referring the matter back was carried.—The Council approved the plans (submitted on behalf of the Charing Cross and Strand Electricity Supply Corporation, Ltd.) for an electricity distributing station on the south side of Beech Street, between Braime's Buildings and Three Herring Court, E.C.—On the report of the Main Drainage Committee, in which appreciation was expressed of the satisfactory manner in which the recent heavy rainfalls had been dealt with by the authorities, Col. Rotton condemned the condition of affairs. He stated that at Wandsworth and Putney sewage to the depth of 5ft. had in many cases been left in the basements. Though the Wandsworth Board had pressed upon the Council the necessity for something to be done, their complaints had not received attention.—Mr. Burns considered that the authorities had done everything possible in the unprecedented circumstances. The fault rested really upon the heads of the landlords, who were allowed years ago to build basements to dwellings below the level of the sewers when full, and below the river at high tide. The Council had prevented that sort of thing in all new dwellings.—Sir John M'Dougall pointed out that in the case of storms and high tides there were districts in London where flooding could not be avoided. The law wanted changing, as it was a scandal that houses should be allowed to be built in low-lying districts with basements.—Mr. Cousins said the Council ought to develop intercepting sewers. At present the sewers could only carry away ½in. of rainfall in twenty-four hours. It was necessary for the Council to press on its main drainage works, about which there were constant complaints. After further discussion Col. Rotton withdrew his motion.—Mr. J. W. Benn said they had been singularly free from accidents on the electric tramway to Tooting, that being principally due to the new automatic life-guard. During the late storm the conduit had acted admirably, and the only interference with the workings was half an hour's delay in the Balham district. He regretted that the City authorities would not meet them in regard to taking the trams over Southwark Bridge.

The Building Act Amendment Bill.

The "City Press" says:—

The question of amending the London Building Act will soon come up again. The Bill of the London County Council which was withdrawn in March has, we presume, been re-drafted, as it is to be discussed at an early meeting of the Council, when we shall learn how far the objectionable features of the measure have been modified. A fortnight ago the chairman of the Streets Committee of the Corporation stated that he had asked for a copy of the Bill, and would endeavour to arrange for a conference. The mistake which led to the unsatisfactory character of the original Bill and its ultimate withdrawal has therefore been repeated, and the committee and the Council must share the blame between them. The Council have not sought the co-operation of the Corporation, and the committee have not taken any steps in the matter, although they were expected to do so. . . . The Bill was objected to because its provisions were unnecessarily drastic, and because of the excessive powers which it would have conferred upon the London County Council in connection with matters of which owners and occupiers in the City have had already an unpleasant experience. It is not that they are unwilling to make adequate provision for the protection of life in the event of an outbreak of fire; but that they are not prepared to submit to the arbitrary dictation of the officers of the Council involving unreasonable and costly structural alterations. What has been insisted on under the Factory Act supplies an unpleasant forecast of what might be expected under an Act which so largely extended the administrative powers of the London County Council as the Bill which was withdrawn proposed to do . . .

New Almshouses at Newport, Mon., were opened last Thursday. Messrs. Habershon, Fawckner & Co., of Newport, were the architects, and Messrs. Jewell & Sons the builders. The cost of the houses, which are situate on Stow Hill, has been about £2,200.

OLD HOUSES AT ELHAM.

CONTINENTAL NEWS AND OPINIONS.

[The following extracts have been translated for The Builders' Journal from the French, Russian, German and Spanish press.]

Iron in Russian Buildings.

A congress was recently held at St. Petersburg with the object of extending the application of iron in Russia. Amongst Russian architects, says the "Novoe Vremya," there appears to be a dread of the use of iron in buildings, probably because of their limited experience of it, so that they give wood the preference even where iron might be used with the greatest possible advantage. Meanwhile wood becomes dearer and its varieties more and more inferior; besides which wood is always subject to the danger of being destroyed by fungus, that curse of wooden beams and planks. The Architectural Society of St. Petersburg submitted the following questions to the congress: – (1) On the preparation of certain kinds of iron applied to the construction of doors, windows, fencings and awnings. (2) On the detailed working out of common types of building construction, *i.e.*, the production of designs for many years suited for wood but to which iron might be applied without recourse to complicated calculations not understood by everybody. The want of such patterns for the insufficiently educated in mathematical calculations can now be seen to be a serious drag on many builders, especially in the provinces. (3) On the application of iron for constructional work in places subject to earthquakes. (4) On the construction of fireproof cupboards and fireproof ceilings and floors with armed cement.

Acoustics.

There is an amusing and interesting article in "La Construction Moderne" on the subject of acoustics, arising out of the appointment of a special commission by the members of the Academie de Médecine, Paris, charged with the duty of finding out what means might be adopted to improve the acoustics of the new lecture-hall (see p. 239 of The Builders' Journal for June 3rd). The ordinary problem was sufficiently difficult, but the work was complicated, says the writer of the article, by the inconvenient habit of private conversation (in the words of one of the academicians, "it must be admitted that in our private conversations our exchange of words tends greatly to prevent our hearing the speakers"). "La Construction Moderne" suggests that one way to improve the acoustics would be to get the members to carry on their conversations outside the hall. But it appears that the academicians are not disposed to miss the pleasure of hearing themselves and the lecturer at the same time. They want a room so arranged that the words exchanged between members may be deadened so as to become no more than a whisper or gentle murmur, while the speeches from the lecture table may resound clear as a trumpet. The architect of the building was unable to solve the problem, and it was hoped that the committee would be more successful. The conclusion it arrived at is, that the noise is carried between two horizontal planes, the ceiling and the floor, the hardness of which causes reverberation and reflects the sound at the most unfortunate angle. The floor is therefore to have a carpet, cotton will be hung under the windows in the roof, and the boxes on the parterre will be closed with drapery. This is what was done at the Trocadero Hall when something "had to be done." If it were desired to take advantage of the reverberation this could only be done for the upper parts of such buildings as theatres, and then the roofs, instead of being concave or flat, would need to be convex. The tests of the committee were made with the aid of the organ, and it was found that with the walls and floors naked the sound was prolonged by nine seconds; but with the lower part of the walls covered in hair-padding and the forms covered with cushions, the duration of the sounds was reduced by two seconds. M. Sabine had made some experiments with various materials Taking the open window as the unit of complete absorption, the tests gave the following results:—

Theatre packed with audience	0·96
Hair-lining	0·76
Carpet	0·20 to 0·30
Linoleum on the floor	0·12
Floor covered with hard pine	0·061
Glass	0·027

This shows that glass is the least absorbent of all. It reflects the sound the most, and is therefore most unsuitable for the purpose; on the other hand, it is seen that the audience is the most favourable element, and that the best way to obtain satisfactory acoustics is to completely fill up the room with people, or, as M. Koning, late manager of the Gymnase, would have said, "with more than the maximum." The article makes a lengthy reference to the English authority, Mr. Ralph Nevill, F.R.I.B.A., F.S.A., and then quotes Mr. Sax, the great musical instrument manufacturer, who on being consulted by M. Garnier, the architect of the Paris Opera House, as to the composition of the material for the roof said that the materials employed for the cupola would have no influence on the reverberation of the sound. He decided to construct it of metal, and there does not appear to be any difference as compared with cupolas made with other material. It is here interesting to observe, however, that such a commission without any comprehensive terms of reference may easily effect a cure worse than the disease. After all, light is a desideratum not to be despised even in a lecture hall, and as experiments have shown glass mirrors to be the best light reflectors, a decision to abolish these in order to improve the sound might lead the members to rejoice in the improvement of their hearing whilst deploring their weakening sight. In one respect acoustics and light go hand in hand. A packed audience helps both—always provided, as to light, that black does not predominate in the dress material. The following from the German "Industriell Rundschau" will not read amiss in connection with the architect's duty to consider other things besides sound: "White walls and roof will reflect about 80 per cent. of the light that strikes them. Dark-brown tapestry will swallow up about 90 per cent. and thus reflect only 10 per cent. The objects in a room with white walls and ceiling will be three times as well illuminated as one with dark-brown walls. The following is the reflecting power of various stuffs:—Black velvet, 0·4; black cloth, 1·2; black paper, 4·5; dark blue, 6·5; dark green, 10·1; bright red, 16·2; dark yellow, 20·2; blue, 30; bright yellow, 40; bright green, 46·5; bright orange, 54·8; white, 70; and mirrors, 92·3. To properly light up a hall, the calculation should be based on one to two candles per square metre of floor-space and half a candle per cubic metre more."

To beautify St. Petersburg.

Some time ago a member of the St. Petersburg Town Council raised the question of offering prizes for the best façades of private houses in St. Petersburg. At present such a competition is being worked out by the technical department of the city council, and at the same time the council has addressed several enquiries to the president of the Municipal Council of Paris, to the Ober-Burgomeister of Vienna, to Brussels and other cites. On the reception of the replies by the council it has been decided to hold the competition.

The Hennebique System.

The invention of M. Monier employing iron as a frame to strengthen bodies of cement found many imitators, some of whom went so far as to patent their modifications of the idea. The owner of the Hennebique system in particular objected to rival imitators, and sought injunctions against two houses, Boussiron and Piketty. But in the Third Court of the Tribunal of the Seine it was judged that the governing patent was that of Monier of 1877–8, and that Hennebique's claim to seek an injunction did not lie.

Architectural Congress in Madrid.

The "Revista de Obras Publicas" says that although it had been intended to hold an International Architects' Congress in Madrid this year, an official notice has just appeared stating that it is adjourned till the year 1904. The supposed reason for the postponement is that the National Budget did not contain funds earmarked to defray the expenses, and the Minister of Instruction and Fine Arts has not the power to allocate any public money to this purpose. This will be the fifth of the series. The programme includes the following items:—(1) Modern art in architectural design, (2) the preservation and restoration of architectural monuments, (3) the character and scope of scientific studies in the general education of architects, (4) the influence of modern processes on constructional form, (5) artistic copyright in architectural work, (6) the education of workmen in the building trade, (7) the influence of legal building restrictions on private contemporary architecture, (8) the expropriation of architectural art—should architects arbitrate between masters, contractors and workmen in cases of misunderstanding amongst them? Of these subjects some are new, and others, such as 2, 5 and 7, the discussion of which was not completed at the Paris Congress of 1900, have been recommended by the Permanent International Committee. Papers may be read in French or Spanish, and may be notified till September 30th next to the executive commission at its offices in the San Fernande Academy, Alcalá 11, Madrid. The fee per member is thirty francs. Wives and relatives of members will be admitted to the various excursions, visits and entertainments that may be arranged for the members of the Congress; such persons also paying thirty francs each. A copy of the preliminary notification containing further details can be obtained from the secretary of the Royal Institute of British Architects, 9, Conduit Street, W.

Cork Slabs.

The cork slab, says "Uhland's Technische Rundschau," has come into use since 1880. It consists of a conglomeration of ground cork mixed with some mineral binding material. It smells somewhat like phenol, but this odour disappears when the brick is faced with plaster. It is only just covered, however, to serve as a preventative from vermin making their home in it. The specific weight of cork bricks differs little from cork itself, varying between 0·23 and 0·25; the weight of a cork brick of 25 × 12 × 6·5 centimetres is about 600 grammes. Cork bricks are pliable, and therefore are not very much subject to mechanical influences. They may be sawn or nailed, and will bind with lime, gypsum, mortar, &c. They are unaffected by changes of temperature, and if placed upon water they will only be soaked to the extent of some centimetres; if completely immersed, although they become soaked, their general constitution is but little disturbed. When dried in the air they show no sign of change. The cork brick is usually employed dry, and generally with an eye to its suitability for sawing, nailing, &c. But in special cases, as in ice houses, where it may be exposed to melted water, or anywhere where it may be constantly exposed to wet, it is set in melted pitch or similar material. The cork brick is a very different material from wood as regards fire. It may be carbonized by a flame, but will never burst into flame; and the effect of such carbonization is to coat the bricks with a spongy soot which renders them proof against further attacks of fire.

R.I.B.A. ANNUAL DINNER.

THE annual dinner of the Royal Institute of British Architects was held on June 23rd at the Hôtel Métropole. Mr. Aston Webb, R.A., the president, occupied the chair. The company numbered over 200 and included the American Ambassador (Mr. Choate), the Earl of Lichfield, the Bishop of London, Viscount Dillon (president of the Society of Antiquaries), Lord Redesdale, Lord Monkswell (chairman of the London County Council), the Lord Mayor (Sir Marcus Samuel), Sir Schomberg McDonell, Sir E. J. Poynter (president of the Royal Academy), Sir John Taylor, Sir Charles Scotter, Sir Norman Lockyer, Mr. Seely, M.P., Sir T. Sutherland, Sir William Richmond, Mr. Charles F. McKim (president of the American Institute of Architects—wearing the Royal Gold Medal), Sir L. Alma-Tadema, Sir W. Emerson, Sir H. Trueman Wood, Sheriff Sir T. Brooke-Hitching, Sir Henry Howorth, Sir Arthur Rücker (principal of the University of London), Alderman and Sheriff Sir G. Truscott, the Archdeacon of London, Sir H. Howse (president of the Royal College of Surgeons), Mr. Thomas Brock, Mr. G. C. Ashlin (president of the Royal Institute of Architects of Ireland), Mr. A. Buck (president of the Surveyors' Institution), Mr Walter Smith (Master of the Carpenters' Company), Mr. Edwin A. Abbey, Mr. E. A. Webb, Mr. Alexander Graham (hon. secretary) and Mr. W. J. Locke (secretary).

Following the loyal toasts was that of "The United States of America." In reply, Mr. Choate said that the proper person to have responded for the toast on that occasion was Mr. McKim, to whom, in London, the eyes of all his countrymen were turned at this moment, with thanks to him for having achieved honour, not so much for himself as for them. But if he must reply to the sentiment, he thought he knew in what spirit he ought to address that assembly, and, speaking of the United States in an architectural sense, he was bound to admit that they were still in the making. They would long continue to be entirely unfinished, and were likely to afford to the profession of architecture lucrative employment for a thousand years to come. And even at the expiration of that period there would still be many vast places to be improved, many noble structures to be erected, much utility, much skill, and much beauty to be lavished upon the buildings of the distant future. He believed that the United States still had a tariff upon works of art—not so high as it once was, but much higher than, he hoped, it would be eventually; but there was no tariff in America upon architects. They were in favour of and would put into practice the principle of the "open door"; but he was authorized by Mr. McKim to say that there was room for all. The report lately made by their distinguished gold medallist, acting under a Commission of Congress, showed that at the beginning of their Government the first President and his Secretary of State were well versed in the noble art of architecture, and that they brought to their aid knowledge acquired upon this side of the water, when a distinguished architect and engineer laid out, in magnificent proportions, the city which was to be the future capital of the United States. In recent years the attention of the Government and the architects of the country had been drawn to the fact that the original plan had not been carried out in its full perfection, and the genius of the architectural profession in America, as represented by Mr. McKim, had combined with the wisdom of Congress to bring about the restoration of the plan. Under their combined efforts, the future would show the city of Washington, with its public buildings, its magnificent avenues, its glorious parks extending through the district of Columbia, in a light that would challenge comparison with any capital in the world. For several generations America was too poor to indulge in the luxury of architecture. In early days architecture was imported, but America had always held the view that architects, like others, were people who were alive to the pursuit of business—and America had improved—and architecture had now been brought into the front rank of occupations in America. Almost every countryside was being adorned with comely, commodious and beautiful country residences. Municipalities were competing with each other as to which should have the finest buildings, and even the United States Congress was spending national funds freely in the erection of architectural court houses—and Custom houses. Let them not forget the Custom houses. The result was that although America now had many architects, it wanted a great many more.

Sir Lawrence Alma-Tadema gave the toast of "The Houses of Parliament," to which the Earl of Lichfield and Mr. Seely, M.P., responded.

"The Royal Institute of British Architects and the Allied Societies" was offered by the Bishop of London, who claimed architects as the faithful comrades of the clergy, and said that the splendid work of Wren, as seen in St. Paul's, had preached a grander sermon to the world than had ever been heard within the walls of the cathedral.

Mr. Aston Webb, in responding, said that the duty of a commission in New York to inspect any work of art that was brought into that city was an example which we might follow in this country. Referring to the question of education in architecture, he remarked that all the American universities had recognized architectural schools, through which all students passed before entering upon practical work. We were attempting something of the same sort in this country, and already day schools for architects had been started. They had been invited to prepare some scheme which would bring the existing means of education to a focus; and a committee had been appointed to deal with the matter. In conclusion he proposed the health of Mr. McKim, who gratefully acknowledged the compliment, as also the honour which, through him, had been paid by the Institute to the American nation.

In replying on the occasion of the presentation to him of the Royal Gold Medal, Mr. McKim gave a sketch of architectural developments in the United States, our report of which we were obliged to hold over last week. Mr. McKim said:—

The early buildings of the New England coast, dating back to the eighteenth century, and more rarely to the seventeenth, from the once vice-regal town of Portsmouth to Charleston, S.C., have happily descended to us despite political revolutions. Notwithstanding their simpler forms, both of construction and design, made necessary by slender means and the circumstances of transplantation, they still reflect the mother-country in their excellence of construction as well as sound and correct taste. Precisely the most interesting, and in their sphere the most admirable architectural monuments of my native land, private dwellings and public buildings alike, are those that most strongly recall their English prototypes. Our obligations, for instance, to Sir Christopher Wren are very imperfectly understood even at home, yet the cities of the Atlantic seaboard, especially in New England, abound in examples showing the influence of his school. The struggle of these landmarks for existence in the advancing tide of commercial prosperity, before which they are gradually being swept away, is a melancholy daily spectacle; not alone deplorable in the loss of historic monuments, but for the lessons they invariably teach of sound proportion, simplicity and good manners. Happily, some of the best examples remain to us. At the seat of Government, for instance, our Capitol, and the home of the President, the White House, are both singularly animated by a pure taste and devoted love of beauty, not to mention the City Hall and the old Department buildings of the city of Washington. Of these, for our information at home, as well as yours, let us gratefully acknowledge that the Capitol, though enlarged and changed since, was originally designed by one William Thornton, the White House by a certain James Hoban, while the City Hall and old Department buildings were the creation of a man of the name of Hadfield—*all Englishmen!*

I can well remember the thrill of surprise and pleasure which I experienced on my first visit to England, more than thirty years ago, in the discovery of a strange familiarity in the appearance of things, and in the sense of not being after all so far from home. Though I did not understand it then, the reason, as has been shown, was not far to seek! I will venture to refer to one more building, of the era which we call early and you ingloriously late, albeit of the period of Adam—the Octagon. Our Institute, which has urged upon Governments—national, state, and municipal—the duty of preserving historic monuments, has itself recently secured possession of one of the historic houses of America, known from its shape as the "Octagon," and designed by the same William Thornton, architect of the Capitol. Here in the early days was dispensed a liberal hospitality bv President Madison, whose home it was. Under its roof, too, the Treaty of Ghent was signed. The house was finished in a manner befitting its importance, and to-day is in excellent state of preservation. Thus the expressed desire and often recurring efforts of the Institute to secure for itself a permanent home have been accomplished after nearly half a century of existence. May it typify to those who assemble in it, as well as to the people of the city of Washington, the spirit of public service.

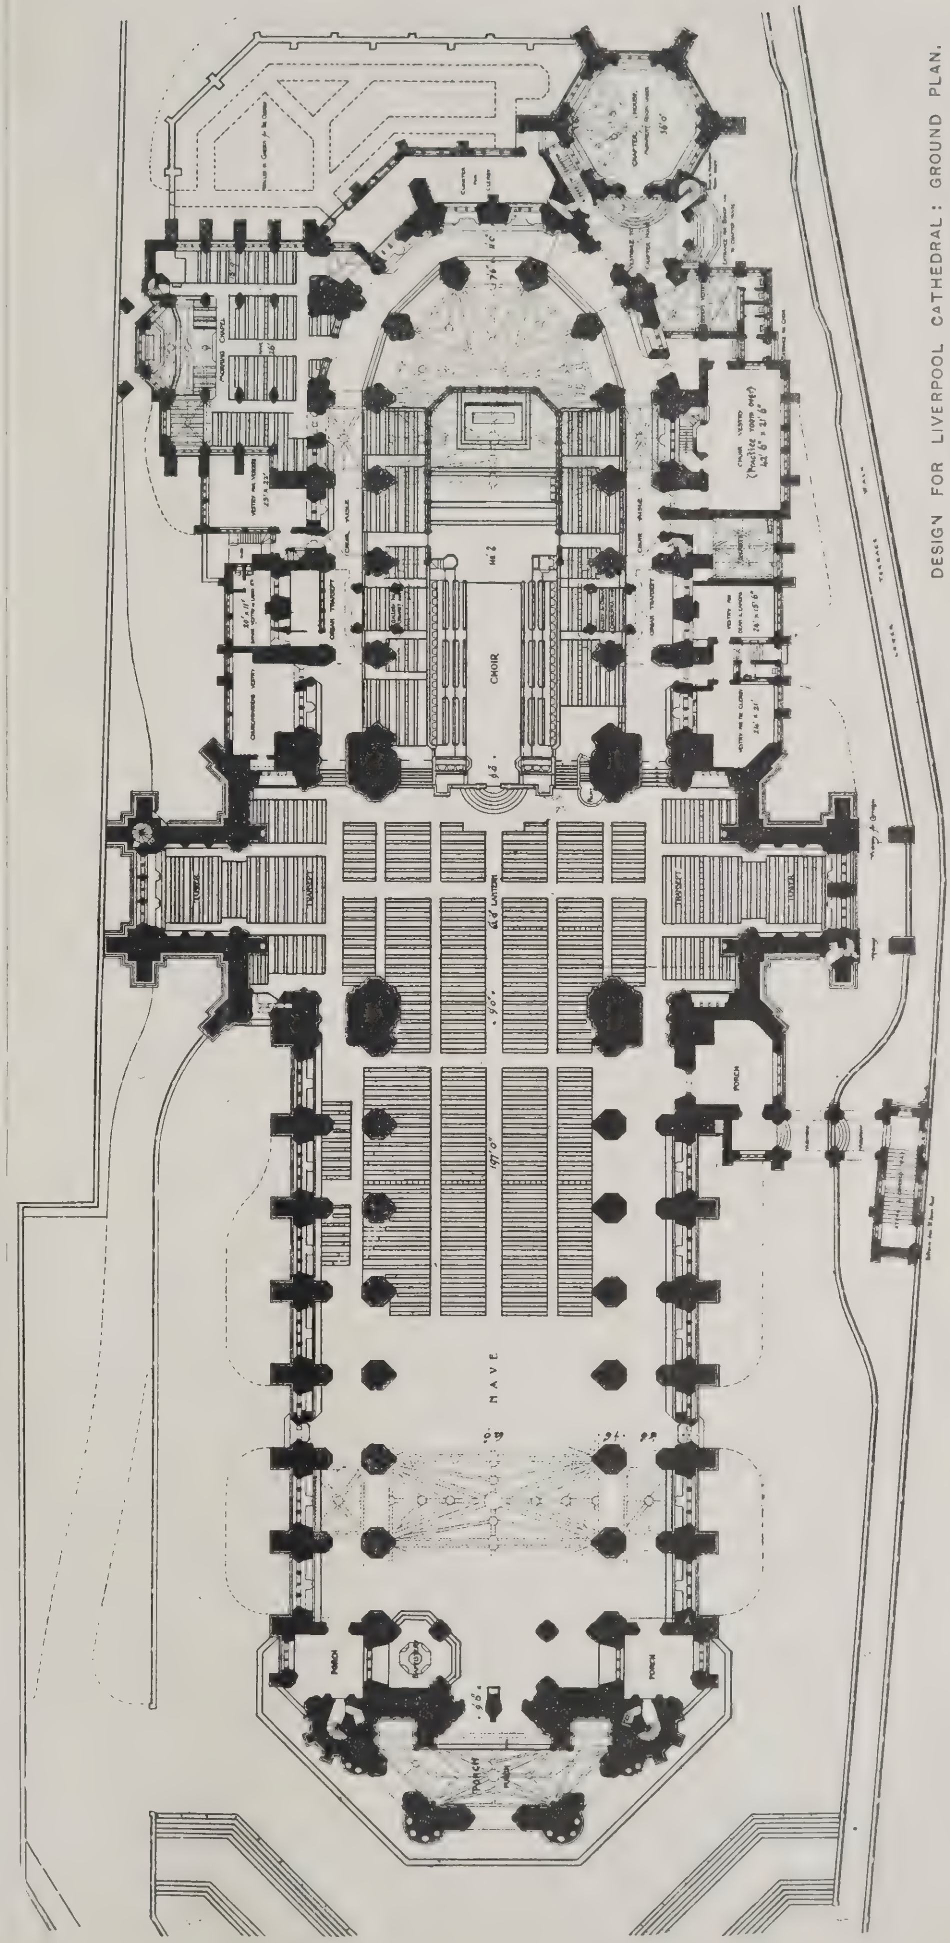
The Institute has ample reason for felicitation in both the increase and betterment of our own schools in architecture, in Harvard, Columbia, Penna, Cornell and Chicago Universities, as well as in the admirable and still older foundation of the Institute of Technology in Boston. The movement to endow an American Academy of Fine Arts in Rome on the general lines of the French Academy in the Villa Medicis is not new. Till now dependent for support upon the insufficient means at the command of the incorporators (members of the Institute), the number of scholars has of necessity been small, and the conveniences for work not such as would be afforded by an older, well-equipped and well-endowed institution. Nevertheless, in spite of its vicissitudes, such has been the quality of the work and men turned out, so strong the conviction of those most deeply interested in the need for an institution offering a post-graduate course intended only for those who shall be already technically well equipped, that a Bill for the incorporation of the American Academy in Rome by Act of Congress, and asking the protection of the United States Government, was introduced in 1901 by the late Senator McMillan. The persons named as incorporators, besides the leading architects, painters and sculptors, include the great universities and technical schools, represented by their presidents, the Secretaries of State and War, the Librarian of Congress, the Government architect and a considerable number of names of men chosen from the community at large known for their interest in art and art education. This Bill passed the Senate, and was favourably reported to the House; but owing to the legislative conditions prevailing in the latter body during the closing weeks of the session, it failed to become law. I am happy to say that it will be reintroduced in the coming fifty-eighth Congress, and is considered to have every prospect of success.

Indeed, we seem to be living in a new age, not only in our private enterprises, but in our relations with the Government. It was no small thing that a committee of the United States Senate, under the leadership of the deeply-mourned Senator McMillan, called into consultation, officially, the Institute and accepted the advice of its committee in the formation of a commission to prepare plans for the improvement of the park system of the district of Columbia, including the location of public buildings. Following this lead have come frequent requests from Government officials on the various and often perplexing problems of their departments, so that, informally and unofficially, there has come to pass a seeking for expert advice as gratifying as it has been unusual.

The forces which have brought about plans for the improvement of the national capitol are acting throughout the land. Not only in the Atlantic seaboard city of New York and the cities of the lake region like Buffalo, Cleveland and St. Paul, but even from far away Seattle, on the Pacific Coast, comes the news of attempts to treat the city as a unit and to develop a municipality as a consistent work of art. It is worthy of note also that as the star of progress takes its western way, the effort at improvement is made with increasing vigour in both enthusiasm and money. As evidence of the times, and amongst the measures voted by the last (fifty-seventh) Congress for new buildings to be erected within the district of Columbia alone, I will quote the substance of a single paragraph from the report of the Senate Commission of the District of Columbia, dated March 14th, 1903: "The fifty-seventh Congress, besides the restoration of the White House, authorized the construction of the Army War College and the Engineer School of Application; a building for the National Museum . . . . ; the Union Railroad Station; an office building for the use of the members of the House of Representatives; a municipal building for the district of Columbia, and a Hall of Records. The cost of these buildings completed will approximate not less than fifteen millions of dollars, or over three millions sterling."

I cannot close even these brief remarks without an expression of appreciation for one whom your eminent body so recently did honour. After nearly half a century of successful endeavour, during which Mr. Hunt held aloft the banner and fought the battles of the Institute, and in the fulness of his powers, at a time when his influence was greatest, he was suddenly taken away.

I have to thank you for the great patience and forbearance with which you have listened to these fragmentary remarks that but poorly express my appreciation of the great honour which you have seen fit to confer upon me.



DESIGN FOR LIVERPOOL CATHEDRAL: GROUND PLAN.
AUSTIN AND PALEY, ARCHITECTS.

Another Carnegie Library.—Mr Carnegie has given £3 000 towards a branch library on Anlaby Road, Hull.

Keystones.

Competition Reform Society.—The committee disapproves of the existing conditions in the competition for a proposed new grammar school at Newark-on-Trent because there is no professional assessor. Members are requested to abstain from competing unless they receive a further communication to the effect that the conditions have been satisfactorily revised.

A new Baptist Church and Schools at Brighton are to be erected in Gloucester Place. Messrs. Battley, Sons & Holness, 21, Old Kent Road, London, S.E., are the contractors, their contract amounting to £5,381. Accommodation will be provided for 725 adults. The architects are Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, of 5, Clement's Inn, Strand, London, W.C.

Among the Birthday Honours was that for Mr. Henry Tanner, principal architect to the Office of Works, who was appointed a Companion of the Imperial Service Order, and the same honour for Mr. F. W. Rudler, late curator of the museum of practical geology in Jermyn Street. This Order was recently instituted by his Majesty for members of the Civil Service of the Empire as a recognition of long and meritorious service.

Clifford's Inn.—At last Thursday's meeting of the Court of Common Council a report was brought up with reference to the preservation of the garden and old buildings of Clifford's Inn. The report stated that in view of the fact that the committee were unable to charge the consolidated rate with any expenses in the matter, they had not gone into the merits of the question; the Court, however, directed the committee to do so.

An Open-air Theatre for Messrs. Lever Brothers, Ltd., Sunlight Soap Works, was inaugurated on June 13th. The permanent building, containing stage, dressing-rooms, &c., and auditorium—which will accommodate about 3,000 people—is enclosed by a steel and iron frame, which was supplied by Messrs. E. F. Blakeley & Co., Vauxhall Ironworks, Liverpool, from designs of Messrs. Grayson & Ould, architects, Liverpool. This is on classical lines, and is altogether unique as regards this country.

A new Scottish Episcopal Church at Bieldside is being erected from designs by Mr. Arthur Clyne, architect, of Aberdeen. The church is in Early Gothic style, with Scottish features, and is built of Rubislaw granite and Hill o' Fare granite. The contractors were:—Mason work, Mr. Frank Morrison, of Culter; carpenter and joiner work, Messrs. Hendry & Keith; plumber work, Messrs. J. Blaikie & Sons; slater work, Messrs. Merson & Stewart; plasterer work, Mr. A. Stephen; painter and glazier work, Mr. Edward Copland; heating work, Mr. R. Tindall; electric lighting, Messrs. Claud Hamilton, Ltd., rest of Aberdeen.

The National Bank of Scotland has erected a new branch at Glasgow at the corner of Glassford Street and Trongate. The elevation is treated with horizontal bands of masonry, each angle being marked by corner turrets with a lofty dormer window between, and the whole crowned with a steep pyramidal roof. The stone has all been obtained from Plean Quarry. Messrs. A. Muir & Son, of Nithsdale Drive, Glasgow, were the builders. The sculpture was executed by Mr. Birnie Rhind, A.R.S.A., the electric elevator by the Otis Company, the steelwork by Messrs. P. & R. Fleming, the safes by Messrs. Chatwood & Co., and the floors by Mr. Stoffert. The electric installation is by Messrs. W. Bryden & Son, and the heating by Messrs. Meckenzie & Moncur. The architect is Mr. Thomas P. Marwick, of York Place, Edinburgh.

Change of Address.—Messrs. W. H. Allaway & Sons, brick merchants, owing to the demolition of No. 31, Nicholas Lane, E.C., have removed to 5, Crooked Lane, King William Street, London, E.C.

Rebuilding the Campanile.—Commendatore Beltrami, the architect and engineer, has commenced work on the rebuilding of St. Mark's Campanile at Venice. For the complete reconstruction, not taking mishaps into account, five or six years are needed. The inside will be just as before, with a space in the centre, however, in which a lift can be put.

Glasgow East-End Industrial Exhibition.—Mr. John Fairweather, A.R.I.B.A., of 136, Wellington Street, Glasgow, has been appointed architect to this exhibition, which will be opened next December. Four competitive designs were submitted to the exhibition council, Mr. Fairweather's being chosen. Much resource was shown in the adaptation of the present buildings and grounds, and in the treatment of the entrance façade and concert hall. The last is designed to accommodate 3,500 persons; the platform will have a fine orchestral organ. The exhibition is being promoted for the benefit of the reconstruction scheme of the Glasgow Royal Infirmary.

Manchester Society of Architects.—On the evening of June 16th thirty members visited the new St. Mary's Hospital, Manchester, of which Messrs. A. Waterhouse & Son are the architects, and were shown with the greatest thoroughness the admirable fittings and arrangements of this excellent modern hospital. On Saturday, June 20th, thirteen members visited Liverpool. Messrs. Norman Shaw & Doyle's White Star Line Offices and Parr's Bank (by Mr. Norman Shaw and Messrs. Willink & Thicknesse) were very much admired, and the excellent design and detail inside and out carefully examined. A visit was also paid to Mr. Mountford's new technical school buildings, where Mr. Willink, chairman of the Committee, with some of the staff, explained the buildings fully, giving special attention to the plenum ventilating system; Mr. Willink also most hospitably entertained the party. A visit to the new Central Fire Station concluded the afternoon.

Obituary.

Mr. Bruce Price, one of the most noted of American architects, died recently in Paris. He was of pure American descent both on the father's and mother's side—from the earliest colonists of Maryland. He was born in Cumberland, Md., in 1845, and studied architecture under the late Mr. Niernsée, of Baltimore. In 1869 be began independent practice as a member of the firm of Baldwin & Price. This partnership continued only four years, and, except a temporary connection with Mr. Freeman, he never formed any partnership until just before his death. It is not impossible that this circumstance contributed to the individuality by which his buildings were distinguished, and which soon brought him into note. Among the earliest of his works were the club-house and other structures at Tuxedo Park, executed for the late Pierre Lorillard; and he afterwards designed many houses in the Tuxedo settlement for various owners. For Yale University he built Osborn Hall, and the Welsh Dormitory, and carried out various important commissions in Canada, among them being the station of the Canadian Pacific Raiload in Montreal and the beautiful Château Frontenac in Quebec. Besides these buildings he designed a great number of churches and private houses both in city and country, while his American Surety Building is still one of the best, if not the very best, of the "high buildings" on Broadway.

Builders' Notes.

A Union prevents a Strike.—The Glouceste District Committee of the Dockers' Unio have refused to grant permission to th builders' labourers to come out on strik owing to the Master Builders' Associatio refusing to concede the $\frac{1}{2}$d. per hour advanc asked for by them or submit the matter t arbitration.

New "Tubes."—The City and Sout London Railway Bill came before the Ear of Belmore's Committee in the House o Lords last Wednesday. The proposals ar to extend the line from the Angel station t Euston, and also to make a new "tube" fron Brixton to the City. The promoters proposed to give an access to Euston, King' Cross and St. Pancras stations by surfac subways. There would also be a subway a Euston with the Charing Cross, Euston an Hampstead railway, so that a connectio would be practically secured with the whol of north-west London.

Messrs. Waygood & Otis, Ltd., declare a dividend of 9 per cent. for the year on the ordinary shares, carrying forward £4,949 During the past year they have carried ou some very important contracts, including lift for Marlborough House (the Prince of Wales) the Houses of Parliament, the Colonia Office and the Shepherd's Bush Station o the Central London Railway. Several larg blocks of City offices have also been fitte up in the same way. Moreover, they have manufactured many of the huge cranes a present on the river. The business of the Otis Elevator Co. has been largely conducte as a distinct department of the company's operations. The directors, however, are o opinion that it is desirable to emphasize still further the distinction between the two types of lift, and thus reap the full benefit of the Otis connection. While the Waygood electric lift, like the Otis, has been brought to a very high standard of efficiency, each possesses special advantages. Certain clients prefer the Waygood type and others the Otis, and consequently the board are desirous of arranging to meet both demands, instead of merging the two types into one.

The Building By-Laws Reform Association, of which the Duke of Westminster is president, has been formed to secure that official control of private buildings shall not extend beyond the demands of public health and safety. That some such organization is needed is obvious from the fact that it is practically impossible for individuals to successfully resist unreasonable encroachments on their liberty. The Association recognizes the necessity for building regulations in places where the interests of public health and safety demand them, but in many districts the existing by-laws and regulations go far beyond this need, and the interference with individual liberty has become intolerable. The Local Government Board, recognizing this, has issued a new set of model by-laws for rural districts, which, with due regard to health and safety, omit some of the objectionable clauses which have hitherto been included. As a first step the Association will turn its attention to the work of getting the old unreasonable by-laws amended, particularly in rural districts, where the hardship is greatest. It is important to point out that these oppressive by-laws have had, and are having, an injurious influence upon the provision of dwellings for the working classes. The amendment of by-laws in urban districts will also have the attention of the Association, in order to secure that more reasonable measures shall gradually be introduced. The hon. secretary and treasurer of the Association is Mr. R. A. Read (45, Parliament Street, Westminster).

Bricks and Mortar.

phorism for the Week.

He that buildeth his house with other men's oney is like one that gathereth himself stones the tomb of his burial.—Ecclesiasticus i. 8.

ur Plates. The main features of Messrs. Austin & Paley's design for verpool Cathedral are a nave, choir and ansepts, all 62ft. wide exclusive of aisles. ie transepts are short, being 33ft. long, and wers about 38ft. square open into the ends. was thought that western towers would tract from the length of the cathedral as en from the west, which has an important proach. Exclusive of the west porch, the thedral is about 450ft. long and 102ft. gh to the nave groining, the choir being . 6in. higher. The central lantern arches e 54ft. wide in the clear, which is about . more than those under the dome of orence Cathedral, though much less than at a. Sophia. The walls are 9ft. thick. The eight on the lantern piers at the base would about 24 tons per ft., and on the nave ers 20 tons. The nave and choir columns e 35ft. high, and the height to the ridge of e nave roof is 139ft. and to the cross on e dome 304ft., the towers being 240ft. high om the floor-line. The choir, being of usual width, allows the stalls to be placed ite within its space and 11ft. from each le wall, with a surrounding low screen and tes instead of the usual high screen. With gard to the 3,000 worshippers to be seated, essrs. Austin & Paley say: "It appears at the area taken up by each chair, inding its proportion of passage-room, is . super. On this basis the 102ft. sq. under e dome of St. Paul's Cathedral would seat oo persons, and at a distance of 155ft. om the pulpit, including the nave and ansepts to this extent, but exclusive of the oir (which is not commanded by the lpit), 2,250 persons can be seated in St. ul's. In this plan for Liverpool Cathedral, the same distance of 155ft. from the eacher, 2,500 persons can be seated under e lantern, in transepts and towers, and in e portion of nave as shown, with an additinal 500 in the choir and its inner aisles, this space would be commanded by the lpit; making in all 3,000 convenient tings, with no pillar obstructing, within 5ft. of the pulpit, and with ample passage ace. Of these, 2,700 would be within oft. of the pulpit." The organ is placed galleries on each side of the choir and ntinued into large organ transepts with ty arches and with extra openings for nd on their western sides. The roof and me would be largely constructed of steel, dome and its flêche being covered with oper. Yellow and pink freestone from rley Dale, and possibly flecked Runcorn, re proposed for the interior.

---

he Stratford Cottages. A report on the proposed site for the free library in Henley Street, Stratford-onon, has been presented to the Committee the Society for the Protection of Ancient ildings by the secretary, Mr. Thackeray rner, and Mr. Oliver Baker, one of the nmittee, who, after describing the old ises known as the china shop, which it is posed to utilize for the purpose of the rary, say: "We consider that the old ises are well worthy of careful preservan from their intrinsic interest of age, and t undoubtedly such buildings would be re likely to be permanently preserved if ularly used and occupied, which seems to ve been only partially the case for some rs. It is certain, however, if the houses no longer be retained for their original domestic use, that in adapting them to the purpose of a library the modern brick front must be so extensively altered that its present character would cease to exist. Moreover it is not structurally in a sound condition, and it cannot be, because the houses being of timber and the front of brick there is no satisfactory bond between them. This brings us to the conclusion that if the buildings are to be used for a library a new front must be erected, and we consider that the whole of the ancient work which remains can be, and ought to be, retained unaltered literally; and to do this it is desirable, if not essential, that the new front should be constructed of timber. . . In order to retain all the old work the upper storey of one house must necessarily overhang the lower, and its baseline cease to coincide with that of the adjoining one . . ."

The Great Theatre Architect. A marble monument to Charles Garnier, the architect of the Grand Opera House, Paris, has just been unveiled. The monument is placed in an outer angle of the Opera House, and is, as it were, a signature upon the building. Upon the pedestal is traced a plan of the Opéra. This is surmounted by the bust of the great architect, flanked by figures in bronze symbolical of Fame and the Graphic Arts. At the inaugural ceremony, which was performed by M. Chaumié, Minister of Public Instruction, due emphasis was laid on the talent of Charles Garnier, which enabled him, a young and obscure architect, easily to carry off the prize in the competition for the Opéra against older and already famous competitors. Charles Garnier was the son of a blacksmith. He was born in Paris in 1825, and at an early age showed an aptitude for drawing. After studying at a decorative school he became the apprentice of a fairly well known architect, but stayed only a short time, as his chief duties consisted of putting wine into bottles and rolling cigarettes. He then took a few lessons from Léveil, and at the age of seventeen entered the Beaux-Arts School. He was twice a candidate for the Grand Prix de Rome, and was accepted on the second application. It was during his stay at the Villa Médicis that he became acquainted with E. About, and that he did so much work for the De Luynes family. In 1826 Garnier was named architect for two arrondissements of the city of Paris, and in that same year was one of the 160 men who applied for the order to construct the Grand Opera House, among whom, it must be stated, were the most famous architects of the day. Exactly one month was allowed for the submitting of the drawings, and, strange to say, Garnier's was the last presented. The Opera House was commenced the following year, but was not completed until 1875. During the whole time of the construction Garnier lived in a small wooden house, from which he could survey the work and where he was constantly visited by friends and by distinguished personages. One day the Empress Eugénie, evidently wishing to express her approval in technical terms, said: "Les anciens ne redoublaient pas leurs points d'appui"; to which Garnier replied, "Madame, ils n'allaient pas non plus en chemin-de-fer." After the Franco-Prussian war Garnier was in despair, for he thought that his work would never be finished, as the Government was so slow in supplying the necessary funds. However, when the old Opera House was burned to the ground the new building became indispensable. It cost £1,520,000, although in 1860 it was estimated that it would only cost £320,000 and the French Government would never own that they had spent more than £600,000. In 1867 Garnier was made an honorary member of the Royal Institute of British Architects, and in 1875, when the Opera House was inaugurated, he became Grand Officer of the Legion of Honour. Besides the Grand Opera House, the most important buildings with which he was connected were the Casino at Monte Carlo and the villas he constructed for himself and his old friend Sarcey. He died in 1898 from a nervous malady, and in great poverty, having all through his life been too generous; he was often seen to give his own personal money to his employees in order to encourage them to execute the work with more promptitude.

Excavations in Palestine. The annual general meeting of the Palestine Exploration Fund was held at the Royal Institution last week. The annual report stated that the principal work of the Fund during 1902 was the partial excavation of Gezer. Mr. Macalister was actively employed there for five months only. The result of the excavations, thus far, had been to show that there are at Gezer seven strata of remains, which carry back the history of the site to the remotest antiquity. In some instances the objects found indicate a continuous history, whilst in others they as clearly show that the continuity has been interrupted either by the advent of a new race or by some event of which the nature is not clearly known. The two lowest strata belong to a period (the Neolithic age) when men used no metal and lived in caves, or in houses built of mud brick. The people were of slight build, and were not Semites. A few rudely-formed idols in stone have been found. The two next strata supply evidence of the occupation of the site by Semites, who were stronger and larger boned than their predecessors, and were more advanced in the scale of civilization. They lived in houses with rude walls of mud and stone, and protected them with strong well-built walls of stone. The bronze weapons of this period have been found buried with bodies. A large number of objects of the most varied kind was found in the two strata; part of an inscribed statue, scarabs and impressions of scarab seals of the Egyptian Middle Empire (about B.C. 2500–1500); flint and bronze implements and weapons, fragments of pottery, and broken idols in stone and clay. The most interesting discovery in connection with these strata is that of a "High Place," which, as far as it has been excavated, consists of a row of eight monoliths standing upright on a stone platform within a walled enclosure open to the air. The fifth stratum from the bottom supplies evidence of a break in the continuity of the occupation, which apparently coincides with the immigration of the Israelites. Iron appears for the first time. The open area of the "High Place" is encroached upon by dwelling-houses, and the *débris* is characterized by those lamp and bowl deposits under the foundations of buildings which Mr. Macalister suggests may be connected with some ceremonial custom peculiar to the Hebrews. The next stratum in ascending order may with certainty be assigned to the period of the Jewish monarchy. The lamp and bowl deposits continue, and the size of the city is reduced. There is evidence that the "High Place" retained much of its sanctity during the greater portion of the periods represented by the fifth and sixth strata. The seventh stratum marks a complete interruption in the history. Flint implements and the lamp and bowl deposits disappear; iron is in common use; the bronze objects are only ornamental; and there is no trace of worship at the "High Place." The masonry of the houses and the pottery types are similar to those found at Tell Sandahannah, in the Seleucid or Ptolemaic town of Marisa; and an Egyptian inscription of the fourth century B.C. was found in the *débris*.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Safe Load on Concrete Columns.

London, E.C.—H. S. writes: "What would be a safe load on solid concrete columns (composed of broken brick and cement) 13ft. high and of 14in. average diameter?"

If composed of 1 part of good Portland cement, 4 of hard-burnt brick, and 1 of clean sand, a safe load would be 10 tons, though concrete columns of the size stated ought to sustain 40 tons before they failed.

Removing Varnish on Oak.

Otley.—A. M. writes: "Referring to the enquiry on p. 289 of your issue for last week, I have always found Egyptian clay paint-remover the best for removing paint or varnish on oak. It is manufactured by the European Chemical Manufacturing Co., of 53, Kirkstall Road, Leeds."

A Sketching Tour in England or France.

Newcastle-on-Tyne.—North writes: "I am going to spend six or seven weeks on a sketching tour, and had thought of passing some of the time in France. Do you think that this is advisable, or would it be better to spend the whole of the time in England? If you think that the former would not be wasting time, please advise me as to where to go."

We think you will do better by studying work in this country first and in other countries afterwards. With these sketching tours there is a great deal of unprofitableness; not because they must of necessity be so, but for the reason that architectural students—and architects too, for that matter—are prone to think the proper way to spend their time is in making more or less elaborate sketches in pencil and colour of tumble-down houses in some remote spot, taking very little trouble to determine the construction they are dealing with or to analyse the composition which may be so delightful to the eye, but rather straining after picture-making and prettiness. Anyone who has the ability and the love of making sketches of old architecture can spend many pleasant hours in this way, and we have nothing to say against the practice if the student is merely passing his time languidly and not bothering to search out any architectural essentials. But the thing is greatly overdone. Students go over to Normandy, and to Belgium and the Rhine, filling their sketch-books with scraps of outline and colour, not taking or even gauging dimensions, in the belief that they are deriving great benefit from it. Doubtless much may be learnt unconsciously in this way; but it is not the kind of learning which these same students find of particular use when they get back to their drawing-boards and have to face the problems of house planning or in contriving the elevation of some drill-hall, shop premises or public house. For these reasons we are surprised that not more attention is given to the vital modern work, both in towns in this country and in cities like Paris, Berlin and Vienna. We repeat that the haphazard study of old houses on the Continent is overdone—we have seen too many fragments of Normandy steeples, Rouen porches and Dinan chimneys, more especially as the students who give their attention to them have probably never properly studied the delightful old houses and other buildings spread over the face of their own land. So that we would advise our correspondent to defer his Continental trip if he seeks most to benefit himself instead of passing the time pleasantly with a book of sketches, and to confine himself to this country, where he may go to whatever part is most to his liking.

Buildings to Measure near Birmingham, Sherborne, Seaton, the Cotswolds and Godalming.

Birmingham.—Subscriber writes: "Please name some buildings within 8 miles of Birmingham suitable to measure (churches preferred)."

The district around Birmingham does not appear to be rich in ancient churches, especially within the prescribed limit of 8 miles. There are, however, two churches which seem well suited for your purpose, namely, Tamworth Church and Temple Basall. Tamworth Church is of the Decorated style throughout, but is unfortunately much mutilated and defaced. Temple Basall belongs to the early fourteenth century. This truly elegant specimen of Early Decorated style of architecture was formerly the church belonging to the preceptory of the Knight Templars at the manor of Basall. After the suppression of the order (Ed. II., 1312) the church was suffered to fall into a state of dilapidation, and it so remained until the year 1677, when it was restored. The roof, gable terminations and the upper part of the tower were probably rebuilt at this period, and the rather unusual arrangement of the latter constitutes one of the most interesting features in the building. The south doorway is now blocked up. It was covered originally by a stone porch, of which the springer of the groined roof still remains. The windows generally throughout the church are of extraordinary beauty, and only two are similar in design. The east window is a magnificent opening of five lights, and offers some little peculiarity in the construction of the tracery. At the west end there are two windows, the larger one of five lights, but considerably smaller than that in the chancel, and above in the gable is an excellent wheel window. The two most easterly windows on the north side are lighter than the others, and therefore probably a difference in level helped to indicate the distinction between the chancel and the nave. On the south side the most westerly window in the chancel is lychnoscopic (*i.e.*, a low side window), and the other is rather stilted to make room for the piscina and sedilia. The latter, of three seats, is richly wrought with mouldings of most exquisite design. The plan is almost rectangular, being 93ft. long and 30ft. 1in. wide. There are also three halls well worth visiting in the neighbourhood of Birmingham. "The Oaks," West Bromwich, is one of the finest and most interesting half-timbered houses in England. It is considered to have been built in the latter part of the reign of Henry VIII. Cladmore Hall, now an inn called "The White Heart," was also built in the reign of Henry VIII. Oakeswell Hall, Wednesbury, is also a building of about the same period. M.

London, S.E.—R. G. N. writes: "(1) I wish to sit for the examination for an A.R.I.B.A. Can I take the Intermediate and Final, or is it essential to sit for the Preliminary as well? (2) Kindly name some building to measure within easy distance of Sherborne, Dorset, and Seaton, Devon."

(1) You must pass the Preliminary examination of the R.I.B.A. before you are admitted to the Intermediate and Final, unless you can obtain an exemption. If you write to the secretary (9, Conduit Street, W.) you can obtain particulars as to the conditions under which exemption from the Preliminary examination is granted. There is a Special Examination to qualify for candidature as Associate R.I.B.A. open to architects in practice not less than twenty-five years of age, and to chief assistants over thirty years of age. For this examination it is not necessary to have passed the Preliminary or Intermediate, and testimonies of study are not required. (2) Sherborne has an abbey church with a magnificent interior. While in this town you should not miss seeing the little chapel of the almshouses with its Flemish triptych and its old glass. There is also an old castle at Sherborne. The little village of Trent has a church which boasts of its extraordinary display of old carved woodwork. It is also notable for its painted glass. Yeovil has a church with a remarkable crypt below the chancel groined from a central shaft. Sandford Orcas, Marston, Rimpton, Montacute, Brampton-D'everoy, Hampton, Langport, Huis-Episcopi and Muchelney have churches of some importance. Montacute possesses the famous Montacute house and a priory of much interest to the student of architecture. The whole district is full of the most charming and varied domestic work.

G. A. T. M.

Scarborough.—F. J. writes: "I and some fellow architects' assistants wish to spend a week or ten days' sketching in the Cotswolds country. We thought of commencing after leaving Gloucester and cycling to Burford, taking in any points of interest *en route.* Kindly suggest a few buildings worthy of study."

The district you have chosen for your sketching tour is so delightfully rich in buildings, domestic and ecclesiastic, that it does not much matter what route you take. If you purchase the R.I.B.A. Journal, Third Series, Vol. X., No. 9, you will find all the information you require in the "Pugin Tour," 1902 (price 1s.). G. A. T. M.

Farncombe.—W. W. J. C. writes: "Could you suggest a building within twelve miles of Godalming suitable to measure for the R.I.B.A. testimonies of study? Is Shere Church a good example?"

The following buildings at Guildford will suit your purpose:—Trinity Church, for the most part of the Perpendicular style; the Town Hall, which is Renaissance; Abbot's almshouses: Clandon Church is also well worth studying. Shere Church leaves little to be desired for the purpose of preparing R.I.B.A. testimonies. The south door is Norman with chevron mouldings; the rest of the church is for the most part Decorated. There is a good Early English font. M.

Newly-plastered Walls.

London, W.—T. H. G. writes: "I have some new walls newly plastered, which must be treated in some way almost immediately so as to make them cheerful and fit for habitation. Can you tell me of a good, cheap and efficient method of treating them temporarily until the plaster is in a sufficiently dead condition to receive ordinary wallpaper?"

We advise you to use the ordinary tar-coated lining-, "Willesden" or "P. & B." papers.

Charge for Laying-out Gardens.

Arbour writes: "(1) Do architects or garden architects make any recognized charge per cent. for their services in connection with the laying-out of gardens? (2) What would be a fair charge to make for designing and superintending the laying-out of a garden of about 2 acres around a house? The garden work has gone on under my superintendence for the past seven or eight months contemporaneously with the house. The cost will be about £450, including the gravel and stocking, but exclusive of the terrace wall and steps and the dipping tank. Should the latter items, which were carried out by the builder, be charged in with the house and covered by the usual 5 per cent. commission?"

(1) No. The charge is usually made

according to the status of the architect or designer and the time occupied. (2) Charge in the wall and tank with the house at 5 per cent. commission. A fair charge for the garden work would, we think, be 30 guineas, unless there was any very elaborate work.

Hair in Wall Plastering.

LONDON, N.—W. V. writes: "What is the ordinary London practice as to internal plastering on new walls where the plastering mortar or 'rough stuff' is of stone lime and sand? It is admitted that hair should be added in the case of ceilings to hold up the plastering mortar whilst it sets, but it is contended that this is not necessary nor usual for walls."

Hair is used to keep the plaster from falling off an overhanging surface, such as a ceiling, by giving it tensile strength while it is yet wet. It is not in the least necessary for walls, because the work is done from the bottom upwards and support is given vertically, friction and adhesion being sufficient to prevent the plaster falling away from the wall.

Student Articled in his Father's Office.

BRADFORD.—KEYSTONE writes: "In the case of a son being articled to his father to learn the profession of an architect, what form of articles of pupilage would be the more suitable, seeing that the usual form as approved by the R.I.B.A. hardly seems to apply to this case. Would not the ordinary form of apprenticeship as issued by the Inland Revenue Office be more suitable, with the words 'profession of an architect' added?"

The Inland Revenue form would be recognized. It would be easy to compile a form from the comparison of the two forms you mention.

University Theatres.

LEEDS.—H. Y. writes: "Where is the best planned university theatre to be seen?"

Plans of the new University for Birmingham, designed by Mr. Aston Webb, R.A., were published recently in the "Building News," and the selected design for Cape Town University was published in THE BUILDERS' JOURNAL for May 27th last, and the second- and third-premiated designs in last week's issue. All these contain lecture-theatres or halls suitable for examinations, and are as good examples as could easily be found. G. A. T. M.

Building on Common Land.

HARPENDEN.—A. H. S. writes: "A certain piece of common field land, chiefly freehold, is held by various owners, who hold equal sporting and certain other rights over it—but the public have no common rights. It is now desired to enclose the land for building purposes. What should be done to accomplish this, so as to abolish all common rights? Must the approval of the Board of Agriculture be obtained, or would a deed properly executed by all owners be sufficient?"

Your question is a difficult one for a layman to answer, and I can only do so in general terms. Such a "tenancy in common" as you describe, though not impossible, is of very rare character, and one wonders how it can have arisen; the word "common" usually presupposes the existence of a lord of the manor and of rights of a quasi-public character. With regard to your proposal that the land should be enclosed and divided upon the basis of mutual arrangement and the execution of one deed, and presuming the facts are upon examination found to be exactly as you describe them, I see difficulties by reason:—(1) That all the tenure is not freehold, and that possibly therefore some are only "limited owners": (2) that it is hardly likely that all the owners are legally in a position to bind their successors, either because of their tenure, minority, lunacy or otherwise; (3) that they will all voluntarily agree to the final terms of partition (even if all are so able to bind their successors). I would suggest that in the first place all the owners should agree to the broad proposition "that the land be divided in accordance with the proportional interest of each," and should formally instruct one solicitor to act on behalf of them all. He will then be able to advise as to the possibility of such a deed as you suggest, or as to the necessity for an application to the Board of Agriculture and procedure under the Inclosure Acts. The essential point, of course, is that a partition such as is desired must be so carried out as to be binding for all time not only upon the parties and their successors, but must also be good in law against the public. A perusal of the Inclosure Act of 1845 (which was the first Act of general application) will give you a good idea of the difficulties attending any private arrangement for the division of land enjoyed under "tenancy of common." G. S. M.

Oak.

FURNESS.—X. L. D. writes: "I am informed that African oak is the best for outside work. Is there such a thing, and is it readily obtainable? (2) Is it known by any other name? (3) Are all foreign oaks called wainscot, or does the term apply to one particular kind? (4) Can foreign oak be easily distinguished from English oak?"

(1 and 2) See correspondence on p. 235 of our issue for June 3rd. African oak is not very easily obtainable. (3) Wainscot as applied to oak simply means that it is for joinery. (4) Only an expert can tell; we may say, however, that foreign oaks are generally straighter in grain than English oak.

Pilfered Plans: Brickwork Pointing.

CARMARTHEN.—CYMRO writes: "(1) I find that a person who has obtained working drawings and specifications of houses which have been prepared by myself is making tracings and copies and building houses from them. Have I any legal remedy? (2) What aggregate should be mixed with Portland cement to give it a good white colour for pointing with red brickwork?"

(1) You have no remedy as the law at presents stands. You should have stipulated in the contract that the person to whom you supplied the plans was not allowed to keep them nor to make any other use of them. (2) Powdered chalk. White pointing is usually done with lime-putty.

Law Cases.

The Accident at All Souls', Langham Place.—The case of *Alleyn* v. *the Langham Hotel Co., Ltd.* was heard last week in the King's Bench division of the High Court of Justice. The plaintiff, a widow, claimed damages for personal injuries received through the fall of the balustrade at All Souls' Church, Langham Place, last July, when it will be remembered a rope with flags on it was attached to the hotel at one end and to the church at the other, on the occasion of her Majesty the Queen opening the Regent's Park bazaar. The defendant company denied negligence, and asserted that the balustrade was in normal circumstances strong enough to support the cable, and was not in a defective nor dangerous condition. If it was defective it was so because of a latent flaw which was not discoverable from the exterior and could not have been detected prior to the fall.—The jury returned a verdict for the plaintiff, with £600 damages.—It is noteworthy that since the accident the balustrade and other stonework has been renewed.

SEA WATER FOR LONDON.*

By J. GRANT-BROWNING, A.M.I.C.E.

THE object of this short paper is merely to revive a formerly much-discussed project, and as briefly as possible to lay its advantages and disadvantages before you. About twenty years ago it was proposed to supply London with sea-water from Brighton, and an Act of Parliament was actually obtained for that purpose, no opposition being raised by any of the water companies, but through the lack of private enterprise the scheme was abandoned. There was also the objection that it multiplied the already numerous water authorities supplying the Metropolis, and the Act did not give powers to force the use of sea-water on the public authorities for municipal purposes, and would not in consequence mitigate the evil now existing—that is to say, the enormous waste of filtered drinking water caused by its use in street-watering, sewer-flushing, water-closet flushing, private baths, public swimming baths and the extinction of fires.

That difficulty could be overcome shortly by the incoming Water Board, who could easily obtain the necessary powers on the score of health and economy. The scheme would remove the necessity of going to Wales for a further supply, and would cost roughly about 25 per cent. of the amount estimated for that purpose if the water were drawn from Shoeburyness, which is much nearer than Brighton. We should also be drawing on an inexhaustible supply requiring no filtration.

The best route from the pumping station at Shoeburyness would be through the town of Southend, and then through all the intermediate growing suburbs to Woolwich, where a branch main could be placed across the Thames to serve South London. The scheme would comprise water towers of the necessary capacity and heights to serve each district passed through, mains therefrom along all main roads in thickly-populated districts, and in the first instance standpipes, hydrants and services to manhole flushing tanks, public baths and washhouses, &c.; and when the demand arose, which it would undoubtedly do, a service main in all other roads would follow, and a connection to each house for private baths and water-closet flushing purposes. In the meantime, however, the householders would have access to the standpipe at the corner of the street by paying a small fee annually for a key. The key system has been adopted at Clacton-on-Sea, where it is much appreciated.

The advantages of salt water for street-watering are that it takes longer to dry than fresh water, is less liable to frost and gives off a pleasant odour. The disadvantages are that on macadamized roads which are not properly scavenged the mud in rainy weather becomes very sticky and adheres to wheels of vehicles, cars and bicycles, and if not promptly removed either hastens rust or leaves its mark on paint.

There can surely be no disadvantage in utilizing sea water for sewer flushing, public baths, extinction of fires, the watering and squeegeeing of asphalt and wood-paved streets, and flushing of house drains, except on the plea of expense in the first cost; and as the abundant supply of good fresh water for drinking and other domestic purposes is an absolute necessity, any scheme which would augment by the prevention of its waste the serving of London, without costing an enormous amount of money in getting it from Wales, should be the first matter of consideration.

---

* A paper read before the "Surveyor" conference at the Building Trades' Exhibition, Royal Agricultural Hall, Islington, London, N., on June 12th, 1903.

The Editors of THE BUILDERS' JOURNAL, in response to many repeated requests by students and others, have compiled the following list of the most suitable books published on the various subjects which appertain to architecture and the building trades. Special arrangements have been made to enable readers to be supplied with books at the published prices, *post free.* An endeavour will be made to obtain for regular readers and subscribers any other Technical Books not in this or succeeding lists, and these will also be forwarded to them post free. The names given in brackets are those of the authors or editors of the respective books.

The Builders' Journal List of Technical Books.

Remittances for the amounts stated below should be sent by postal orders, addressed to THE PUBLISHER, TECHNICAL JOURNALS, LTD., 6, Great New Street, London, E.C.

No. 2 LIST.

ART, DECORATION, AND DESIGN.

	s.	d.
Handicraft and Design (W. A. S. Benson)	5	6
A Primer of Art (The Hon. John Collier)	1	0
The Origins of Art (Yrjö Hirn)	12	6
Some Principles in Every-Day Art (Lewis F. Day)	3	6
Suggestions in Design (John Leighton)	42	0
Design (Richard G. Hatton)	5	0
Decorative Design (Frank G. Jackson)	7	6
Theory and Practice of Design (Frank G. Jackson)	9	0
Practical Designing (Gleeson White)	5	0
Nature in Ornament (Lewis F. Day)	12	6
A Handbook of Ornament (Hugh Stannus)	10	0
A Manual of Historic Ornament (Richard Glazier)	5	0
Principles of Ornament (James Ward)	7	6
The Anatomy of Pattern (Lewis F. Day)	3	6
The Planning of Ornament (Lewis F. Day)	3	6
Birth and Development of Ornament (F. E. Hulme)	3	6
Elementary Decoration and Practical House Decoration (James W. Facey)	5	0
Decoration of Houses (E. Wharton and O. Codman)	12	6
Modern Mural Decoration (A. Lys Baldry)	12	6
Practical Decorator and Ornamentist (G. A. and M. A. Audsley)	75	0

ARCHITECTURE, HISTORY AND STYLES (*See also* "Planning").

	s.	d.
Decorative Part of Civil Architecture (Sir William Chambers)	21	0
Principles of Design in Architecture (E. L. Garbett)	2	6
Modern Architecture (H. H. Statham)	10	6
The Seven Lamps of Architecture (John Ruskin)	7	6
Principles of Architectural Composition (J. B. Robinson)	10	0
History of Architecture (Prof. Banister Fletcher)	21	0
Classic and Early Christian Architecture (Prof. T. Roger Smith and John Slater)	5	0
Gothic and Renaissance Architecture (Prof. T. Roger Smith and Sir Edward J. Poynter)	5	0
Architecture for General Readers (H. H. Statham)	12	0
European Architecture (Russell Sturgis)	18	0
Principles of Athenian Architecture (F. C. Penrose)	8 gns.	
Development and Character of Gothic Architecture (Charles Herbert Moore)	21	0
The Story of Architecture (P. L. Waterhouse)	1	0
Elementary Architecture, Classic and Gothic (Martin A. Buckmaster)	4	6
Grecian Architecture (Earl of Aberdeen)	1	0
History of Gothic Art in England (E. S. Prior)	31	6
History of Renaissance Architecture in England (R. Blomfield)	50	0
Short History of Renaissance Architecture in England (R. Blomfield)	7	6
Architecture of the Renaissance in England (J. Alfred Gotch)	163	0
Early Renaissance Architecture in England (J. Alfred Gotch)	21	0
Later Renaissance Architecture in England (John Belcher and Mervyn Macartney)	163	0
Orders of Architecture (R. Phené Spiers)	10	6
The Orders of Architecture (W. H. Leeds)	1	6
The Styles of Architecture (T. Talbot Bury)	2	0
The Seven Periods of English Architecture (Edmund Sharpe)	12	6
Architecture of Marcus Vitruvius Pollio (Translated by Joseph Gwilt)	5	0

ASYLUMS.

	s.	d.
Asylums and Asylum Planning (G. T. Hine)	3	6

BATHS AND HYDROPATHICS.

	s.	d.
Public Baths and Wash-houses (R. O. Allsop)	6	0
Turkish Baths (R. O. Allsop)	6	0
The Hydropathic Establishment and its Baths (R. O. Allsop)	5	0

BREWERIES.

	s.	d.
Breweries and Maltings (G. Scammell)	12	6

BUSINESS PREMISES.

	s.	d.
Planning and Construction of High Office Buildings (William H. Birkmire)	15	0

CHIMNEY DESIGN.

	s.	d.
Boiler and Factory Chimneys (R. Wilson)	3	6

COLOUR (*See also* "Paints").

	s.	d.
Colour (Prof. A. H. Church)	3	6
Colour (George H. Hurst)	7	6

ESTATES.

	s.	d.
Building Estates (F. Maitland)	2	0
Outlines of Landed Estates Management (R. S. Burn)	2	6

FACTORIES.

	s.	d.
Factories, Workshops and Warehouses (B. H. Thwaite)	9	0

FARM BUILDINGS AND STABLES.

	s.	d.
Farm Buildings (Professor J. Scott)	2	0
Farm Buildings (A. Dudley Clarke)	6	0
Stable Building and Stable Fitting (Byng Giraud)	7	6

FIRES AND FIRE PREVENTION.

	s.	d.
Facts on Fire Prevention (Edwin O. Sachs), 2 vols.	25	0
Chemistry of Fires & Fire Prevention (H. & H. Ingle)	9	0
Theatre Fires and Panics (William Paul Gerhard)	6	6
Fireproofing of Steel Building (J. K. Freitag)	10	6
Fire Protection of Mills (E. J. H. Woodbury)	10	6

GARDENS.

	s.	d.
Art and Craft of Garden Making (T. H. Mawson)	25	0
Landscape Gardening (Edward Kemp)	10	6
Landscape Gardening as Applied to Home Decoration (Samuel T. Maynard)	6	6
Formal Gardens in England and Scotland (H. Inigo Triggs), 3 parts	63	0
European and Japanese Gardens (Glenn Brown)	10	0

HEAT AND HEATING.

	s.	d.
Heat (P. G. Tait)	6	0
Elementary Treatise on Heat (Balfour Stewart)	8	6
Elasticity and Heat (Lord Kelvin)	6	0
Theory of Heat (J. Clerk Maxwell)	4	6
Lardner's Handbook of Heat (B. Loewy)	6	0
Practical Treatise on Heat (Thomas Box)	12	6
Warming Buildings (C. Hood and Frederick Dye)	15	0
Baldwin on Heating (William J. Baldwin)	10	6
Steam Heating, &c. (Frederick Dye)	10	0
Hot-water Supply (Frederick Dye)	3	0
Principles of Hot-water Supply (John W. Hart)	7	6
Modern Plumbing, Steam and Hot-water Heating (J. J. Lawler)	21	0
Heating and Ventilating of Buildings (Rolla C. Carpenter)	17	0

HORTICULTURAL BUILDINGS.

	s.	d.
Horticultural Buildings (F. A. Fawkes)	1	0

HOUSES, COTTAGES, &c.

	s.	d.
House Architecture (J. J. Stevenson)	36	0
Modern House Construction (G. Lister Sutcliffe)	48	0
Erection of Dwelling Houses (S. H. Brooks)	2	6
The Dwelling House (George Vivian Poore)	3	6
Evolution of the English House (S. O. Addy)	4	6
Cottage Building (C. Bruce Allen)	2	0
Cottages: How to Arrange and Build Them	3	6
Bungalows and Country Residences (R. A. Briggs)	12	6
Construction of Healthy Dwellings (Sir D. Galton)	10	6
Country Homes (Batsford)	15	0
Sketches of Village and Estate Buildings (James Williams)	15	0
Handy Book of Villa Architecture (C. Wickes)	31	6
The Domestic House Planner and Sanitary Architect (Ward, Lock)	5	0
Houses for the Working Classes in Urban Districts (S. W. Cranfield and H. J. Potter)	15	0
Housing Handbook (W. Thompson)	6	0

HOSPITALS AND SANATORIA.

	s.	d.
Hospitals and Asylums of the World (Sir Henry Burdett)	12 gns.	
Cottage Hospitals (Sir Henry Burdett)	10	6
Small Hospitals (A. Worcester and W. Atkinson)	5	6
Healthy Hospitals (Sir Douglas Galton)	10	6
Sanatoria for Consumptives (F. R. Walters)	12	6

LAUNDRIES.

	s.	d.
The Steam Laundry (J. Taylor)	7	6

LAW.

	s.	d.
London Building Acts, 1894-98 (Prof. Banister Fletcher)	6	6
Tribunal of Appeal under the London Building Act (Charles H. Love)	3	6
Engineering and Architectural Jurisprudence (John Cassan Wait)	25	0
Law of Contracts (John Cassan Wait)	12	6
Building Contracts (Frank W. Macey)	15	0
Law of Operations Preliminary to Construction in Engineering and Architecture (John Cassan Wait)	21	0
Light and Air (Prof. Banister Fletcher)	6	6

LIBRARIES.

	s.	d.
Library Construction (F. J. Burgoyne)	6	0

LIGHT, LIGHTING, GAS.

	s.	d.
Light (E. W. Tarn)	1	6
Light (P. G. Tait)	7	6
Chemistry of Gas Manufacture (W. J. A. Butterfield)	10	6
Construction of Gasworks (S. Hughes & W. Richards)	5	6
Acetylene (Vivian B. Lewes)	31	6
Acetylene (Frederick Dye)	6	0
Acetylene Gas (W. Doman)	3	6
Practical Gasfitting (Walter Grafton)	5	0

LIGHTNING CONDUCTORS.

	s.	d.
Lightning Conductors (Richard Anderson)	12	6
Report of Lightning Rod Conference	7	6

PAINTS AND PAINTING, &c.

	s.	d.
Manual of Colours and Dye-Wares (J. W. Slater)	7	6
The Artist's Manual of Pigments (H. C. Standage)	2	6
Manufacture of Lake Pigments from Artificial Colours (Francis H. Jennison)	7	6
Testing and Valuation of Raw Materials used in Paint and Colour Manufacture (M. W. Jones)	5	0
Recipes for the Colour, Paint, Varnish, Oil, Soap, and Drysaltery Trades (An Analytical Chemist)	7	6
Manufacture of Mineral & Lake Pigments (J. Bersch)	12	6
Manufacture of Paint (J. Cruickshank Smith)	7	6
Painters' Colours, Oils, and Varnishes (G. H. Hurst)	12	6
Chemistry of Pigments (Ernest J. Perry)	10	6
Dictionary of Chemicals and Raw Products used in the Manufacture of Paints, Colours, Varnishes, and Allied Preparations (George H. Hurst)	7	6
Manufacture of Varnishes, Oil Refining and Boiling, and Kindred Industries (Ach. Livache)	12	6
Practical Polish and Varnish Maker (H. C. Standage)	6	0
Drying Oils, Boiled Oil and Solid and Liquid Driers (L. E. Andés)	12	6
Dipping, Burnishing, Lacquering & Bronzing Brass Ware (W. Norman Brown)	2	0
French Polishing and Enamelling (R. Bitmead)	1	6
Painting and Decorating (W. J. Pearce)	12	6
House Painting, Graining, Marbling, and Sign Writing (E. A. Davidson)	6	0
House Decorating and Painting (W. N. Brown)	3	6
Imitation of Woods and Marbles (A. R. and P. Van der Burg)	25	

PHYSICS.

	s.	d.
Lessons in Elementary Physics (Balfour Stewart)	4	6
Text-Book of Physics (W. A. Anthony and C. F. Brackett)	12	6
Elementary Text-book of Physics (Prof. J. D. Everett)	3	6

PLUMBING.

	s.	d.
Modern Plumbing, Steam and Hot-Water Heating (J. J. Lawler)	21	
Plumbing (W. P. Buchanan)	3	6
Practical Science for Plumbers, &c. (J. Wright Clarke)	5	
External Plumbing Work, &c. (John W. Hart)	7	6
Hints to Plumbers on Joint Wiping, Pipe Bending, and Lead Burning (John W. Hart)	7	6
Plumbing (S. Stevens Hellyer)	5	
The Plumber and Sanitary Houses (S. S. Hellyer)	12	
Plumbing and Sanitation (G. B. Davis and F. Dye)	55	
Standard Practical Plumbing (J. P. Davies)	18	
Plumbing, Drainage, Water Supply, and Hot-Water Fitting (John Smeaton)	7	6

RAILWAY BUILDINGS.

	s.	d.
Buildings and Structures of American Railroads (Walter G. Berg)	21	

ROOFS.

	s.	d.
Roof Carpentry (George Collings)	2	
Construction of Roofs of Wood and Iron (E. Wyndham Tarn)	1	6
Trusses of Wood and Iron (William Griffiths)	4	6
Design of Simple Roof Trusses in Wood and Steel (Malverd A. Howe)	8	6
Iron Bridges and Roofs (August Ritter)	15	
Text-Book on Roofs and Bridges (Mansfield Merriman and H. S. Jacoby)	42	

SCHOOLS AND COLLEGES.

	s.	d.
Technical School & College Buildings (E. C. Robins)	18	
Planning and Construction of Board Schools (T. J. Bailey)	2	
Modern School Buildings (Felix Clay)	25	
School Architecture (E. M. Wheelwright)	21	
Modern American School Buildings (W. R. Briggs)	17	

STATICS, STRESSES AND STRAINS

	s.	d.
Elementary Statics, (J. B. Lock)	3	
Treatise on Elementary Statics (W. J. Dobbs)	7	
Treatise on Statics, with Applications to Physics (G. M. Minchin) 2 vols.	26	
Statics by Algebraic and Graphic Methods (Lewis J. Johnson)	8	
Graphic and Analytic Statics (R. Hudson Graham)	16	
Principles of Graphic Statics (G. S. Clarke)	12	
Elements of Graphic Statics (Prof. Karl von Ott)	5	
Graphics for Engineers, Architects, Builders (Charles E. Greene)	26	
Graphical Determination of Forces in Engineering Structures (James B. Chalmers)	24	
Stresses and Thrusts (G. A. T. Middleton)	5	
Stresses in Framed Structures, Strength of Materials, and Theory of Flexure (A. Jay DuBois)	42	
Theory and Practice in the Designing of Modern Framed Structures (J. B. Johnson, C. W. Bryan, and F. E. Turneaure)	42	
Strains on Structures of Ironwork (F. W. Sheilds)	5	
Course on Stresses in Bridges and Roof Trusses, Arched Ribs & Suspension Bridges (W. H. Burr)	15	
Simple Practical Methods of Calculating Strains on Girders, Arches, and Trusses (E. W. Young)	7	
Formulas for Resistance of Beams and Girders (P. H. Philbrick)	2	
Pocket Book of Calculations in Stresses, &c. (E. Monson George)	3	
Materials and Construction (Francis Campin)	3	

SURVEYING AND LEVELLING.

	s.	d.
Practical Surveying (George W. Usill)	7	
Land and Engineering Surveying (T. Baker)	2	
Treatise on Surveying (Prof. William Gillespie)	25	
Practical Land Surveying (W. Burness)	12	
Surveying as practised by Civil Engineers and Surveyors (John Whitelaw, jun.)	10	
Treatise on Surveying (R. E. Middleton, O. Chadwick, and J. du T. Bogle)	21	
Theory and Practice of Surveying (J. B. Johnson)	17	
Handbook for Surveyors (Mansfield Merriman and John P. Brooks)	8	
Plane Surveying (Paul C. Nugent)	15	
Land and Engineering Surveying, Levelling, &c. (H. S. Merrett)	12	
Principles and Practice of Levelling (F. W. Simms)	8	
Levelling (Thomas Holloway)	5	
Engineers' Surveying Instruments (Ira O. Baker)	12	
Trigonometry (Prof. Henry Adams)	2	

THEATRES.

Trade and Craft.

Baths of To-Day.

The new bath list issued by Messrs. Adams & Co., of Leeds, contains, in addition to the usual photographic reproductions, three large colour prints of new bath designs introduced by this well-known firm of sanitary engineers. The designs in question are the "Pomegranate," the "Lily" and the "Chesnut." Each is substantially the same in treatment, that is to say, the bath proper is decorated on the outside with a floral design treated as a running pattern, the hood at the end, with shower over, having a sprig of the design continued upwards in a simple but effective manner. The walls of the bathroom are shown tiled with a similar design, so that the result is very harmonious and pleasing. The colour schemes are good, being bright and cheerful. Adams's special hooded bath 6ft. long. inside, including parallel-sided cast-iron plunge bath 2ft. wide nside, with wide roll edge, is metallic enamelled and has stencil decoration in colours on the outside; the stand- and supply-pipes are of copper nickel-plated and the bath has hot, cold, waste, spray and shower ittings, with a lock-up door giving access o them. An inexpensive variety of this bath is made as well as the more costly rticle. All kinds of other baths are supplied by the firm—one which seems to us to be specially good is the "Insular," which as a base skirting that gives it a firm ppearance.

New Companies.

F. W. Mayer & Co, Ltd., builders, contractors,
corators, &c., dealers in stone, sand, lime. bricks, &c.
apital: £20,000 in £10 shares.

Edwin Marshall & Sons, Ltd., builders, contractors,
corators &c., dealers in stone, sand, lime, bricks,
nber, &c, Chapel Street Saw Mills, Ashton-under-Lyne,
apital: £6.000 in £1 shares.

Crown Staffordshire Porcelain Co, Ltd., stone-
are, brick, terra-cotta and tile manufacturers, &c.
apital: £11,000 in £1 shares (3,000 preference, 6,000
dinary and 2,000 others to be issued as preference or
dinary at option of directors).

Bowling Co., Ltd., colliery proprietors, engineers,
ick, tile and pipe manufacturers, &c., Bowling Bradford.
pital: £20 000 in £1 shares.

Engineering Contract Corporation, Ltd., iron-
unders, electrical and mechanical engineers, &c., 36,
ombard Street, E.C. Capital: £3 000 in £1 shares.

J. H. Sankey & Son, Ltd., builders' merchants,
ilders and contractors, &c., Essex Wharf, Canning
wn, Essex. Capital: £50,000 in £1 shares.

Property Trust, Ltd., land and house dealers
ilders, contractors, &c. Capital: £5 000 in £1 shares.

W. & J. Ellison, Ltd., ironmongers, ironfounders,
gineers' tool makers, builders, contractors, &c., Para-
e Street, Liverpool. Capital: £50,000 in £10 shares.

Albert Freehold Brickworks, Ltd., brick tile and
tery manufacturers. Capital: £20,000 in £1 shares.

British Electric Signs Co., Ltd. manufacturers and
alers in electric and other advertising signs and
vices, &c. Capital: £20,000 in £1 shares (12,000
ferred ordinary).

Henry Bramah & Sons, Ltd., furnishing and general
nmongers, builders' ironmongers, &c., 11, Forgate
l Chapel Walk, Sheffield. Capital: £10 000 in £1
res

V. Hosken & Co., Ltd., quarry owners, granite and
ne merchants, &c. Commercial Road, Penryn,
nwall. Capital: £20,000 in £1 shares.

owley Daniel Ltd., tar paving and asphalt con-
ctors, &c. Capital: £100 in £1 shares.

. G. Brown (Brighton), Ltd., ironmongers' and
ders' merchants, &c., 70, Trafalgar Street, Brighton.
ital: £25,000 in £1 shares (10,000 preference).

artshill Brick and Tile Co., Ltd., brick and tile
nufacturers, and dealers in bricks, tiles, pipes, stone-
e and earthenware, &c., Hartshill, near Stoke-on-
nt. Capital: £7,000 in £1 shares.

ermann M. Moller, Ltd. timber merchants, saw-
owners, &c., Baltic Chambers, Sunderland. Capital:
000 in £5 shares.

Coming Events.

Saturday, July 4.

Northern Architectural Association.—Annual Excursion to Ripon Cathedral and Skelton Church, 12.10 p.m.

Wednesday, July 1.

Royal Archæological Institution.—Prof. B. Lewis on "Roman Epigraphy in North Italy." Mr. Harold Brakspear on "Roman Villa at Box," 4 p.m.

Builders' Foremen and Clerks of Works' Institution.—Ordinary Meeting at 8 p.m.

Friday, July 3.

Art Workers' Guild.—Paper on "Masonry," 8 p.m.

Tuesday, July 7.

Sanitary Institute.—Annual Congress and Health Exhibition at Bradford. First Day. Reception of the Members in the Town Hall by the Mayor of Bradford at 12.30. Public Luncheon in Technical College at 1.30 p.m. Opening of the Health Exhibition in Bellevue Volunteer Barracks, Manningham Lane, by the Mayor of Bradford, at 3 p.m. (Exhibition remains open till July 25th.) Inaugural Address to the Congress in the Public Hall of the Technical College by the Earl of Stamford, at 8.30 p.m.

Wednesday, July 8.

Sanitary Institute.—Annual Congress and Health Exhibition at Bradford. Second Day. Conferences of Municipal Representatives, of Medical Officers of Health, of Engineers and Surveyors to County and other authorities, of Veterinary Inspectors, of Sanitary Inspectors, of Ladies on Hygiene, on Industrial Hygiene, and on the Hygiene of School Life, from 9 30 a.m to 2 p.m., in the Town Hall, Technical College, Mechanics' Institute, Church Institute, and School Board Offices. Conversazione and Reception in St. George's Hall by the Mayor at 7.30 p.m.

Thursday, July 9.

Sanitary Institute.—Annual Congress and Health Exhibition at Bradford. Third Day. Meetings of Section I., Sanitary Science and Preventive Medicine; Section II., Engineering and Architecture; and Section III., Physics, Chemistry and Biology, in the Church Institute and the Technical College from 10 a.m. to 2 p.m. Lecture in the Public Hall, Technical College, by John Slater, B.A., F.R.I.B.A., at 8.30 p m.

Friday, July 10.

Sanitary Institute.—Annual Congress and Health Exhibition at Bradford. Fourth Day. Meetings of Sections I., II. and III. from 10 a.m. to 2 p.m. Closing Meeting of Congress in Church Institute at 1.30 p.m. Popular Lecture in Mechanics' Institute, by Major Ronald Ross, at 8.30 p.m.

A QUEENSLAND TREE.

THE silky oak (*Greville arobusta*), one of the most valued trees for timber purposes in North Queensland, is spreading in many parts of the world, especially in Ceylon; it is very hardy and drought-resisting, and flourishes equally well at sea level and 6,000ft. above. The tree enjoys popularity and wide diffusion on account of its vitality, beauty of foliage and value of timber. Its favourite habitat are the scrubs that lie back from the northern coasts of Queensland. The silky oak exudes both a gum and a resin. As to its vernacular name, Hooker says: "From its deeply dissected foliage and the silkiness of the underside, it has obtained the name of 'silk oak' among the pine cutters of Moreton Bay (Queensland)." When split on the quarter, this timber shows a handsome oak-like grain, the prefix silky being either because of the silky underside of the leaf or on account of the bright appearance of the freshly split wood. The Queensland aborigines call the tree "Kroomkabang." The tree bears a profusion of orange-yellow flowers, which, like those of most members of the natural order to which it belongs, are rich in honey, and hence are sought after by the bees. The chief characteristic of the timber is its fissility. It is light in colour, and has a handsome oak-like figure. It is moderately hard, and works well. Two well-seasoned slabs of this wood have weights which correspond to 38lb. 14oz. and 36lb. 2oz. respectively per cub. ft. Specimen slabs of this beautiful wood can be inspected at 49, Eastcheap, at the City office of the Agent-General for Queensland; these slabs, together with specimens of other North Queensland woods, were supplied by Messrs. Rooney & Co., timber merchants, Townsville. A Bournemouth contractor, Mr. C. Hunt, recently ordered 5,000ft. of silky oak and cedar for testing purposes from Queensland.

THE LONDON

OF OUR

FORE-FATHERS

is rapidly disappearing, and many picturesque bits of Old London have already been demolished to make room for modern requirements.

The following Photogravures (reproduced by the Rembrandt Process), from originals by Mr. F. L. Emanuel, form a lasting record of many of these interesting buildings.

No further copies can be published, as the plates have been destroyed, and the pictures are therefore quite unique.

Single Copies at the following Prices:—

1. The "Old Horse and Groom," Back of Holborn-above-Bar (since demolished).	6d. each.
2. Holywell Street, from St. Clement Dane's Church (since demolished).	2s. 6d. each.
3. The "Old Bell," Holborn (since demolished)	1s. 6d. each.
4. Leather Lane, Holborn.	1s. 0d. each
5. Davies Street (since demolished).	9d. each.
6. Fetter Lane, View from Holborn.	6d. each.
7. King Street, Westminster (since demolished)	1s. 6d. each.
8. Staple Inn, Holborn.	2s. 6d. each.
9. Milford Lane, Strand, and Booksellers' Row, looking West (since demolished).	6d. each
10. Lincoln's Inn Fields.	1s. 6d. each.
11. Archway, Portugal Street, Lincoln's Inn Fields	9d. each.
12. Old Houses in Strand.	6d. each.
13. Exchange Court, Strand.	6d. each.
14. Foubert's Place, Regent Street.	2s. 6d. each.
15. Rupert Street, W.	9d. each.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

July 8, 1903. Vol. 17, No. 439. 9, East Harding Street, E.C.

Technical Education. The past week has been noticeable for two important proposals, namely, the establishment of two institutions to give technical education in branches of applied science superior to that at present offered in any public college in this country, one modelled on the lines of the famous Technical High School at Berlin in the suburb of Charlottenburg, and the other a school of metallurgy and metallurgical research as a memorial to the late Sir Henry Bessemer. There is no reason why these two schools should clash; the metallurgical school can very well serve as a department of the other, but while the former is wholly praiseworthy in object, there are certain questions which throw doubt upon the great advantages which it is generally accepted must accrue from the establishment of a technological institute on the lines of that at Charlottenburg. The proposal has been referred to the General Purposes Committee in conjunction with the Technical Education Board of the London County Council for their consideration, and we may expect this body, which has already done so much for London in the way of technical education, to thoroughly thrash out the subject and afford conclusive evidence of the best course to pursue. It is an unfortunate fact that technical education in this country has been pushed by persons who have had no experience of trade and who never seem to grasp the facts. We have seen numerous technical institutes established without any scheme, primarily with the idea of educating the public in branches of knowledge that apply in trade, and yet generally any pupils that offer themselves, whether they have had a proper foundation in elementary knowledge or not, are given tuition. The teachers' acquaintance with the subjects is often only book knowledge, and they aim at cramming the pupils through some examination set by men almost as impractical as themselves. This seems the natural effect of leaving education in the hands of the ordinary teacher, who secures advancement according to the number of pupils he manages to cram through the examinations. The examination system is one of the chief curses of technical education in this country. When a youth goes into a business firm he is not examined every few months, but his general progress is judged by his teachers, *i.e.* his principals, who are continually in touch with him and know his real abilities and progress, without being misled by any peculiarities of his own individuality or the little accidental features which have so much to do with the position one secures in an examination list. In business a youth acquires knowledge by practical experience, and the result is that he is not crammed with facts he but half understands and soon forgets. In any scheme of technical education which is to be of real and lasting benefit to trade, the colleges must be run on the same lines in these respects as a business firm, and the student should be allowed very great freedom in the choice of his own procedure in the study of any subject. This principle of free choice is adopted to a great extent at our universities, and is one of the special features at Charlottenburg, but is not even there carried so far as it might be. We would not have any set examinations in the suggested higher technical college, but leave the granting of diplomas to other bodies, such as the Royal Institute of British Architects, the Institution of Civil Engineers, &c. If this course were pursued our manufacturers and professional men would undoubtedly be more ready to engage young students from our technical colleges at good salaries, instead of offering the paltry remuneration they find their services are worth under present conditions of training. If their services were more valuable to our manufacturers, we have no doubt higher salaries would be paid than the £120 to £300 a year, which is what students from Charlottenburg can be obtained at. The parents and guardians would then find it worth while to pay adequate fees to make self-supporting such an institution as Lord Rosebery suggests, just as they are at present prepared to pay heavy fees to article their charges to professional men, architects and engineers. The London ratepayers ought not to be called upon to contribute £20,000 a year to support this proposed institution—it is neither right on economic grounds, nor is it just that one city should sow alone what the Empire will reap. Such a state of affairs as at present exists not only in this country but in Germany, notwithstanding its boasted excellence, proves that somewhere things are radically wrong. Lord Rosebery does not suggest that architecture shall be one of the subjects dealt with at this Central College of Applied Science, as is the case at the Charlottenburg College of which he is so much enamoured. This is wise, because the Architectural Association has already taken the matter in hand with its day and evening schools, and furthermore the Royal College of Science has recently come forward, under Mr. Beresford Pite and Mr. W. R. Lethaby, with a comprehensive scheme that promises well, while with Prof. F. M. Simpson at University College, London, and reform in the Royal Academy Architectural School, great improvements are taking place all round. But we see many directions in which such a School of Science as is suggested could, if conducted properly, be of very great service to architecture and the building trades. The subjects with which Lord Rosebery thinks it might deal are chemical technology, mining and metallurgy, electro-chemistry, electric traction, optical technology, bacteriology, railway and marine engineering, hydraulics and naval architecture. These subjects are of course chiefly connected with the engineering professions and trades, but there are many portions of them which apply to the building crafts, and we see no reason why students of building construction should not attend certain of the lectures. With bacteriology there might very well be combined sanitary engineering, which would have a very direct connection with architects, plumbers, &c.

The Statue of James the Second. THE removal of the statue of James the Second from its original position at the rear of the Banqueting House in Whitehall, and its subsequent disappearance, are matters for regret to every lover of the arts. There are so few statues in the metropolis of which we have reason to be proud, and the withdrawal of this one from the public gaze is a distinct loss to art. The tale goes that the King was desirous of removing the statue to Windsor Castle, but this project was opposed by Lord Windsor, the First Commissioner of Works, who has not yet made up his mind as to its future position. The quadrangle in the front of the Admiralty has been suggested as a suitable site, James, when Duke of York, having been First Lord of the Admiralty, as readers of Pepys's Diary may remember. This appears to be a plausible reason, but it would be preferable to restore the statue to the site for which it was originally designed. It is lamentable that our works of arts should be moved about, like pawns on a chess-board, at the caprice of the Sovereign. George the Fourth proposed in 1827 to remove the roof of King John's Palace to Eltham, and instructed Sir Jeffrey Wyattville to report as to the practicability of doing so, but on receiving an adverse report the King fortunately desisted and the roof has come down to us in its integrity. In any other country but England the palaces at Eltham and Bromley-by-Bow would have been scheduled as historical buildings and placed under proper supervision.

S.K. EXAMINATIONS, 1903.

BUILDING CONSTRUCTION:

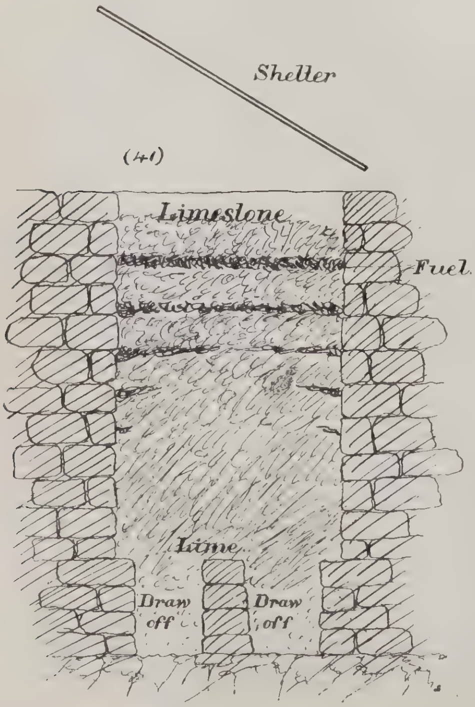
Honours, Part I.

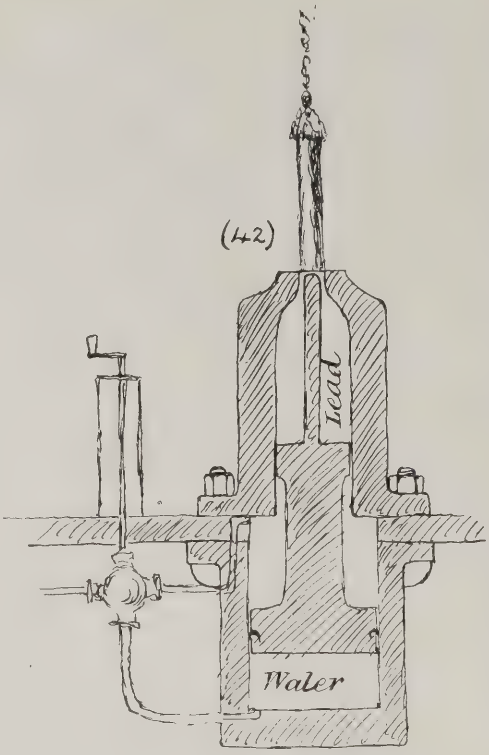
[Answers to questions set in the Elementary examination were given in our issue for May 20th and in the Advanced in our issue for May 27th last.—The examination lasts four hours. You may not answer more than six questions, of which at least one must be selected from each of the first two divisions and two from the last. The tracing must be attempted. Sketches and answers may be on the squared paper which is attached to the drawing paper. Additional foolscap may be obtained from the superintendents of the examination. The tracing should be drawn on the tracing paper attached to the drawing paper. The drawings, in answer to questions 44 and 50, should be on the drawing paper; they may be in pencil.]

Division I.

41. (*a*) Describe a limekiln — illustrate with sketches. Describe the preparation of limestone for burning. (*b*) Given Ca 40, O 16, C 12: what weight of lime should result from a charge of 4 tons of limestone? The weight of limestone is made up of 3·424 tons of $CaCO_3$ + ·4 ton of a substance not altered in weight by the burning, + ·176 ton of water which is driven off. (*c*) How many cwt. of coals (approximately) are required to burn 4 tons of limestone to lime? (51)

(*a*) The duty of a limekiln is to provide a suitable chamber in which limestone can be economically heated to the temperature at which carbonic acid gas (carbonic anhydride, CO_2) dissociates from lime (calcium oxide, CaO); it must also provide for the carrying away of the carbonic acid from the lime, because if they cooled in presence of one another they would recombine into limestone; there must therefore be a moderate draught through a limekiln. Where there is a demand for large quantities, probably the most economical form of kiln for lime-burning is the Hoffman kiln. The varieties of limekilns very much depend upon the local circumstances, nature of available fuel, demand for lime, character of the limestone, &c. A common form is a cylindrical pit, lined with the best fire-resisting substance available at the place (firebricks or some kinds of sandstone or trap stones), formed against the side of a small hill. Limestone and fuel are added in layers at the top from time to time, and lime removed from time to time from a draw-hole below (see sketch). The limestone is broken into convenient-sized fragments: chalk limestone to pieces 10in. in diameter and smaller; compact mountain limestone (carboniferous) to 3in. or 4in. fragments. If the stone is very dry it may be well to slightly sprinkle it with water.





(*b*) 44 per cent. of 3·424 + ·176 water is driven off = 1·68; 4 − 1·68 = 2·32 tons of lime.

(*c*) With the kiln described above, the weight of good coals or coke required may be taken to be about $\frac{1}{8}$th of the weight of the limestone; for 4 tons, 10 cwt. In a Hoffman kiln the quantity of fuel required is much less.

Note.—A student would not be expected to write as much as is here given in answer to (*a*). A short description of a practical limekiln that he has seen would be quite enough. Long rigmarole answers remembered from books commencing "Limekilns are of two kinds, flare-kilns and tunnel-kilns," &c., if they are accurate, may get full marks, but they are not good answers. What a student reads in a book he should assimilate; he should be unable to repeat it exactly as he read it.

42. Describe exactly the manufacture of lead pipes for plumbers' work. Illustrate your description with sketches. (45)

Lead pipes are squirted—that is, the lead is forced by pressure through an opening of the proper size to form the external surface of the pipe. In this opening is placed a core to form the bore of the pipe; the core is held in position sometimes by thin knife-like arms attached to it and to the opening. These arms divide the lead as it is pressed through the opening, but the lead re-unites at the other side owing to the great pressure, and also because the torn surfaces have no opportunity of oxidizing while they are apart.

In some cases the core is not attached to the opening, but moves up through it as shown in the sketch. The arrangement sketched is better suited to large pipes than to small pipes, because a large core is rigid—keeps its place well, so that the pipes are squirted truly of the same thickness all round a cross-section.

Lead is melted in a suitable melting pot or furnace; it is poured from ladles into the lead chamber, where it solidifies. Hydraulic pressure is applied by means of a powerful pump to the bottom of the compound piston, which is thus forced upwards, squirting the pipe through the opening. Large section-pipes are carried straight up, supported by a cord or chain, which has a heavy balance weight attached to its other end and passing over a pulley above. Smaller pipes are guided over rollers to reels, on which they are wound as they come from the presses. There are many obvious varieties of squirting presses: in some the pressure is downwards, and the supply of lead runs direct from the furnace into the squirting cylinder; not through the pipe opening, but through a special opening, which is uncovered when the piston is up in the position to commence its downward stroke.

Note.—Notwithstanding the commonness of the operation of squirting plumbers' pipes, and the covering with lead of insulated copper cables for electrical purposes, if a student tries to get information on the subject from books he will find that these operations are not described in books at all. Useful information of this kind, naturally, has not found its way into books up to the present, mainly because the workman feels apart from books as practical helps. It is to be hoped that, as a result of the development of what is now so much talked about under the somewhat vague title of "technical education," the workman physicist will become less dumb and that in the future he will more freely tell his fellow workmen—and the possibly more ignorant persons he conceives to be his betters—about his friends, the materials with whom he passes his working day.

43. Describe carefully the preparation of plaster-of-Paris. In what respects does plaster-of-Paris differ from the gypsum from which it is made? (45)

The fragments of gypsum are cleaned by picking and chipping off dirty and stained portions; the cleaned fragments are pulverized and ground fine; the gypsum is then placed in cast-iron pans which are heated from beneath; it is kept stirred in the pans; after about three hours (if the proper temperature is maintained) it should be sufficiently "boiled." When the gypsum is ovened before grinding it forms what is called "baked" plaster.

Gypsum is a compound of calcium, sulphur, oxygen and water. We can conceive the compound divided into three parts; the calcium, sulphur and oxygen forming one part, and two separate portions of water. When gypsum is just heated sufficiently to drive off one portion of water it has become plaster-of-Paris. It is now ready, if the opportunity is offered, to recombine with a fresh portion of water, and in so combining its particles will unite together; the substance sets, forming a cohering solid. It will not do to continue to raise the heat till all the water is driven off; gypsum so treated becomes an anhydrous substance $CaSO_4$, which does not behave like plaster-of-Paris. To make good plaster, just the proper quantity of water must be driven off by heat.

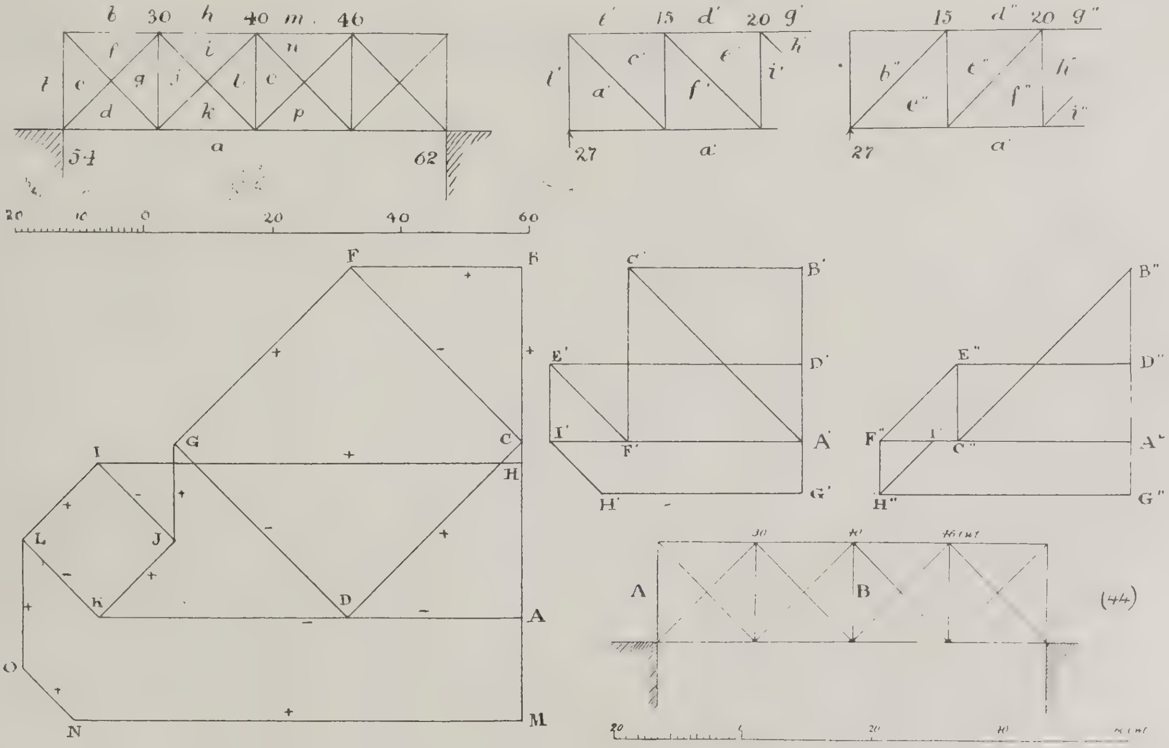
Division II.

*44. It is assumed that the girder shown may be separated into two determinate girders, placed side by side, and the load also divided and placed equally on the two girders. When thus loaded and stressed the two girders may be recombined without alteration in the stresses. On this supposition find graphically the stresses in the members of the girder loaded as shown. (Full marks will be given for an accurate continuous diagram which will include all the joints between A and B.) (51)

See accompanying diagrams.

To find the weight on each support take moments about the right-hand point of support, using a bay as unit of length. $\frac{46+80+90}{4} = 54$; the weight sustained by the right-hand support is 62.

Note.—It would be absurd in this case to draw a funicular or linked polygon. Some of the work shown on the past diagrams might be omitted by a candidate; I have drawn them fully so as to be clear to students. A question like this was recently worked in THE BUILDERS' JOURNAL. Students who had carefully studied the articles contributed by me to this Journal would have no difficulty with any one of the three "strength" questions in Division II. I will venture to say that if students carefully make themselves familiar with the building mechanics of those articles, they will be able to work fully any such questions which are likely to be set in these examinations, and they will be prepared for most mechanics' questions likely to arise when they come to practise. The sign — marks tension, + marks compression.



45. The reservoir (for distribution) of the waterworks of a small town is a circular cylinder 30ft. high and 20ft. in diameter. When the cylinder is full of water, what is the tensional stress in a ring of the cylinder 1ft. wide (or deep) whose centre line is at the height of 1ft. 6in. from the bottom? What should be the thickness of iron plate to safely sustain this stress? (51)

The pressure per sq. ft. at the centre of the ring is $28{\cdot}5 \times 62{\cdot}5 = 1781{\cdot}25$ lbs. The pressure at a diameter, forcing two halves of the ring apart, is 20 times this, because the projection of a half hoop on the diameter is 20 sq. ft. This pressure is resisted by the hoop at two places (the extremities of the diameter taken), so that one section of hoop has to resist half the total amount, or $17812{\cdot}5$ lbs. If we assume that we shall stress the iron to 4 tons per sq. in., $4 \times 2240 = 8960$. $\frac{17812{\cdot}5}{8960} = 2$ nearly; that is, 2 sq. in. of iron would be sufficient to bear the stress. But the plate is 12in. deep, it therefore may be $\frac{2}{12}$ or $\frac{1}{6}$in. thick.

This is the easiest question on the paper.

*46. A mild steel joist, of the cross-section shown, rests horizontally on two supports, one at each end, having its web vertical; it is 40ft. long:—

(*a*) Given

$$\Delta = \frac{5}{384}\,\frac{WL^3}{EI},\ E = 30{,}000{,}000 \text{ (lb.-in.)},$$

$$I = \frac{bd^3 - b_1d_1^3}{12},$$

find Δ in inches. (Rounded angles taken as not rounded; take the average thickness of flanges.)

(*b*) What is the maximum stress in lbs. per sq. in. upon the steel at the cross-section of greatest bending moment? (51)

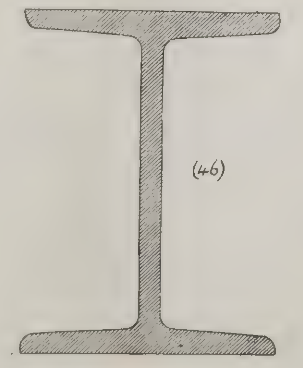
Area of cross-section = $9{\cdot}5$ sq. in. $W =$ 1,266 lbs.

$$(a)\quad \Delta = \frac{5 \times 1266 \times 480^3}{384 \times 3(10)^7 \times I} = \frac{60{\cdot}7}{I} = {\cdot}614\text{in.}$$

$$I = \frac{6 \times 8^3 - 5{\cdot}5 \times 7^3}{12} = 98{\cdot}83.$$

(*b*) The bending moment at the centre of the joist is $\frac{1266}{4} \times 240 = 75960$ (lb.-in.); this is resisted by $\frac{2Ip}{d}$, where p is the stress per sq. in on the extreme fibres $\therefore p = \frac{d\,75960}{2I}$ $= \frac{8 \times 75960}{2 \times 98{\cdot}83} = 3074$ lbs. per sq. in.

Note.—The first part of this question is mere arithmetic; the second part involves the recollection of what is called the strength modulus (or formula) of the section. This a student should remember, and he should be able to work it out, to check his recollection. The working out involves nothing higher than arithmetical progression (the sum of the squares of the first *n* natural numbers.).



DIVISION III.

*47. The drawing (see next page) shows a vertical section through a diameter of a circular concrete and masonry reservoir; the flat cover is supported upon cast-iron pillars 6in. in diameter, metal $\frac{3}{4}$in. thick; square flanges on their ends, 12in. by 12in., $\frac{7}{8}$in. thick (the pillars are not shown on the drawing, they are thirty-four in number). Find accurately (*a*) the quantity of masonry and concrete combined; (*b*) the quantity of water in gallons that the reservoir will hold when the water surface is within 6in. of the roof; (*c*) the weight of iron in the pillars; (*d*) the quantity of surface to be floated and trowelled smooth; (*e*) draw up an estimate of the cost of this reservoir (omit standpipe, overflow and wash-out, but include manhole and foot irons). (51)

$$(a)\quad 82^2 \times 14\frac{\pi}{4} - 70^2 \times 11 \times \frac{\pi}{4} - 79\frac{4{\cdot}5 \times 11}{2}\pi$$
$= 25{,}459$ cub. ft. = 943 cub. yds.

Note.—First, I take the whole as if it were a big cheese; the second term deducts the interior; the third term deducts the outside ring of triangular cross-section which is cut off by the batter. I find the area of this triangle to be $\frac{4{\cdot}5 \times 11}{2}$, and I find the distance of its centre of gravity from the centre to be $39{\cdot}5$ft., *i.e.*, the diameter of the path of its centre of gravity is 79ft.; its path is therefore 79π, and by Guldin's theorem its volume is as given above. This is much the easiest way to take the quantity.

(*b*) $70^2 \times 10{\cdot}5\frac{\pi}{4} - 70 = 40339$ cub. ft. = 252,119 gals.

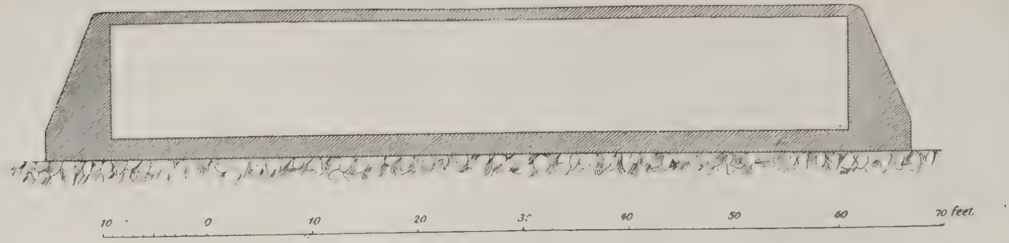
Note.—70 is the volume of wetted pillars; each pillar is 28in. cross-section; $10\frac{1}{2}$ft. of this cross-section are very nearly 2 cub. ft. (extra for foot flanges neglected).

$$(c)\quad \frac{36 - 20{\cdot}25}{144}\frac{\pi}{4}\,11 + \frac{144 - 36\frac{\pi}{4}}{1728} \times \frac{7}{4} = 1{\cdot}125$$

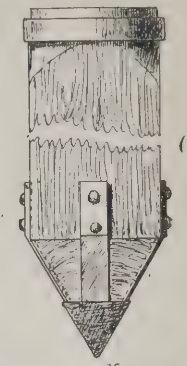
cub ft. iron in each pillar, say 513lbs. each, say 8 tons in 34 pillars (allowing filleting).

(*d*) $2 \times 35^2\pi + 36{\cdot}5^2\pi + 70 \times 11\pi + 76 \times 12\pi + 82 \times 3\pi = 17940$ sq. ft., or, say, 2,000 sq. yds.

Note.—First term gives floor and roof inside, second term top surface, third term

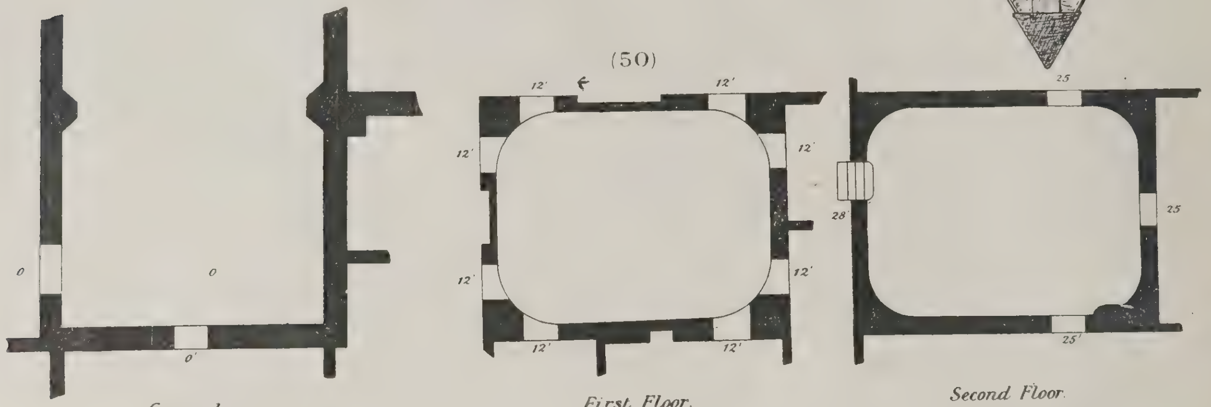


Scale, (47) *and* (50)



(51)

(50)



Ground. *First Floor.* *Second Floor.*

vertical wall inside, fourth term sloping face, fifth term vertical outside face.

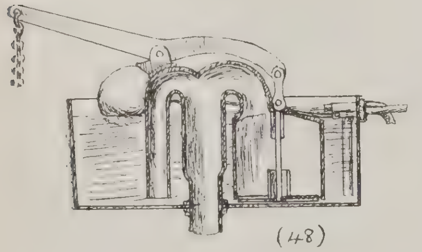
(*e*) ·943 cub. yds. concrete and masonry at £1 -	£943 0 0
2,000 sq. yds. face floating at 1s. - -	100 0 0
8 tons cast-iron pillars at £7 - - - -	56 0 0
Manhole and foot irons	3 10 0
	£1,102 10 0

Note.—Manhole opening not deducted from concrete.

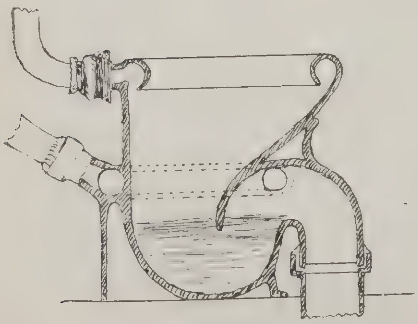
48. Sketch to the scale of about $\frac{1}{8}$ a vertical section to show the parts of a first-class washdown water-closet. Show the connection with the soil-pipe; show the flushing tank and explain its parts and mechanism; show particularly the connections of the porcelain with the metal piping. (51)

See accompanying illustrations.

There is some variety in flushing tanks. The common principle is to start a syphon, which will empty the contents of the tank down the flushing pipe into the closet as quickly as may be necessary to cleanse it. The advantage of a syphon over a common lift-up valve is: first, the discharge is completed with one pull at the chain (with a lift-up valve it would need to be held open during the whole time); second, the syphon is less likely to leak down the flushing pipe than a lift-up valve. The flushing tank shown is fitted with a ball valve whose delivery pipe reaches to near the bottom of the tank; this is to prevent a hissing splashing noise when the tank is refilling. When the tank is full the ball rises and shuts off the supply; there is an overflow pipe which is ready to act in case the ball valve fails to shut off the supply when the tank is full. This overflow pipe may be carried to the outside of the building, to a lavatory waste, or connected to the flushing pipe some distance down the wall (if connected near the top it interferes with the syphon action), or it may discharge independently into the closet basin. It is advisable to have its discharge noticeable, so as to call attention to the defective ball-valve.



(48)



In the form of syphon tank shown a pull upon the chain raises the piston in the cylinder; this forces the water in the cylinder over the bend of the syphon; this starts the syphon, which empties the tank.

The *weak* point in closets hitherto is the connection between the porcelain and the metal soil pipe. An arrangement may show very great care—indeed, excessive care everywhere but at this joint, which we may find made with some compound of white lead or glazier's putty stuck against a damp porcelain surface, an absolutely unreliable joint. A joint can now be made called metallo-keramic, which is a perfectly tight joint to the porcelain.

The connection between the flushing pipe and the closet basin is not sanitarily important; it is only necessary to have it fairly water-tight. This joint is usually made with white lead and gaskin, secured outside with indiarubber tied on with copper wire.

49. Give careful instructions; give dimensions; make sketches of parts; specify particularly the materials; for a good ordinary pattern house-painter's ladder 30ft. long. How much should it cost? (45)

See accompanying illustration. The drawing shows the two bottom rungs and a cross-section of the ladder; an iron tie is also shown. The tie is shown screwed for a nut at one end; some painters prefer to rivet the tie so that there shall be no projecting nut. It is advisable to keep the ties fairly close to rungs; this brings the hole bored for the tie close to the hole bored for the rung, and this makes it advisable to have the tie ends or washers as shown with points turned down to penetrate the wood of the ladder sides.

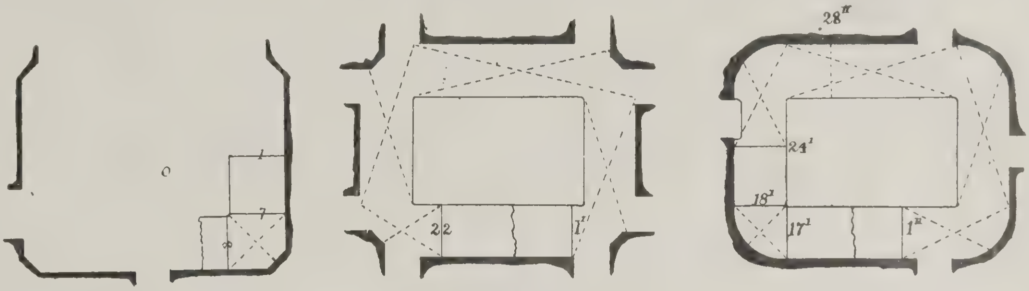
It is common to bore the holes for the rungs taper; the sketch does not show them so. If rungs are wedged the taper makes the wedging less efficient. It is usual to shape the rungs thicker in the middle than at the ends; the sketch shows them of uniform thickness and shouldered against the sides. The rungs are shown not circular in section, and having a greater shoulder at top than bottom; this is done to provide for the wear from feet going up and down. Ladder rungs wear next the sides. A man does not go up a ladder placing his feet on the centres of the rungs.

A strong active house-painter is able to butt a 30ft. ladder against a wall and raise it himself without assistance; he can also work with it up. Resting it against his shoulder he can walk with it balancing. The ladder ought not to be too heavy for a man to do this with it. Unlike other workmen, house-painters are continually moving their ladders; they use them without much slope, and there is very little bending moment. The sides shown in the sketch are rather too heavy; they should be 1in. less in depth and $\frac{1}{2}$in. less in thickness at the top; 3in. by $1\frac{3}{4}$in. should be enough. The rungs should be all of the same length, 11in. between the ladder sides; the top rungs may be lighter than the bottom rungs, as they get less wear.

Choose a good straight and straight-grained Norway spruce spar; have it carefully and truly sawn up the centre; have it cleaned to the proper taper and cross-section everywhere: place the two dressed halves together and fix them; mark for holes 10in. apart; have them bored truly parallel without twist at right angles to the axis; the holes should be 1in. full and should be slightly tapered from the outside to make the wedging hold. The rungs should be of good well-seasoned oak; it is quite common to make them of good sound old spokes: they should be dressed to the proper shape between sides cut to the proper length over-all, and the ends should be turned to fit the holes: the sides of the turned parts should be dressed, eased with a chisel, so that in driving they will not tend to split the sides: they should be cut with a fine saw for the wedges. There should be four iron ties like that shown. The rungs should be driven with good white-lead paint wedged with oak wedges, also driven with paint and the sides cleaned off. The ties should now be put in, screwed up fast, and the overlength of screwed end cut off with a hack saw and smoothed with a file. The ladder sides should now get three coats of good white-lead paint: it is not necessary to paint the rungs.

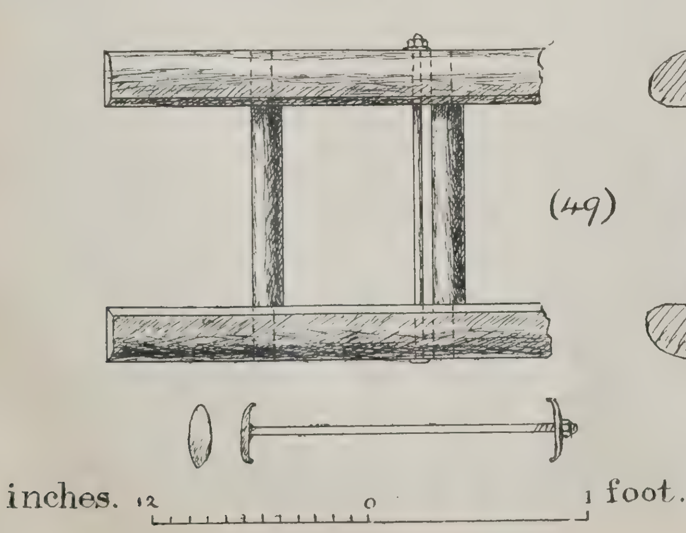
*50. The drawings show the ground floor and the first and second floors of a building and the doors opening into a central well; there is a third floor having three doors exactly over the three doors marked 25ft. on the second-floor plan. Design stairs and landings for these floors. The height of the third floor is 40ft.; winders are not allowed; it will be sufficient to show the risers of bottom steps and top steps at landings, &c., and to give the number of intermediate risers; landings should be marked distinctively with two diagonal lines. The heights over ground of the different floors are marked on the plans:—Ground floor 0 ft., first floor 12ft., second floor 25ft. and 28ft. (the risers are shown from the 25ft level to 28ft. level). (51)

See accompanying illustrations.



Ground. First Floor Second Floor. (50)

Commencing on the ground floor at 1, the first riser, we have 7 risers to the first landing; a total of 22 risers to get up 12ft. gives landing space at the doors on the first floor. It will be found that we have head-room on the stairs to place our first riser, 1_1, from the first floor, as shown. But there is not much to spare, and it is a question whether it is not advisable to put 22 risers, the distance of 1 going nearer to the door. It is, however, not comfortable to having a downward riser close to a door, and so the stairs are placed as shown. We have 24 steps to rise 13ft.: from 1_1 (first-floor plan) to 24_1 (second-floor plan) this is just manageable as shown, owing to it being necessary to have riser 24_1 before reaching the steps shown as rising to a floor to the right at a height of 28ft. from the ground. We have to rise from the second-floor to the third floor, 15ft.: this is done with 28 risers. We can afford a little more space between the door and the first riser, 1_{11}, and we give it: it will be found that we finish at 28_{11} as shown, providing two quadrant landings. The going is uniform and the height of riser fairly uniform.



(49)

51. (*a*) Sketch to the scale of $\frac{1}{8}$ the head and point of a 12in. by 12in. timber pile prepared for driving. (*b*) What do you know of the pressure between the base of the monkey and the head of the pile after impact? (*c*) If a monkey weighing 8 cwt. falls 7ft. to the head of a pile and drives the pile 1ft., what is the effective average pressure on the head of the pile during its motion? (*d*) If the pile is driven only a very short distance (or is not noticeably moved) can you estimate the force or pressure? (*e*) In general terms, compare the effect of the stroke of a monkey of, say, 4 cwt. falling 14ft. with that of the monkey and fall given above. (51)

(*a*) I make the hoop for the head of the pile fairly large. It is probably most usual to shoe the point, having the straps fastened to the casting with bolts. If, however, the piles are uniform 12in. by 12in., and a large number to be driven, it may be worth while to have the straps let into the casting as shown.

(*b*) The monkey has kinetic energy of a known quantity (neglecting friction in the guides, &c.) just before meeting the head of the pile, and we know that this energy can only be delivered up in opposing a pressure through a distance. During the time that the monkey is coming to rest the pressure is changing: if we imagine very short equal intervals of time, each having its special pressure, then if each pressure is multiplied by the distance moved by the monkey in that infinitely short interval, the sum of all these products will be equal to the energy in the monkey. This energy is partly transmitted to the pile and delivered by it to the soil at its point and sides, and it partly heats the pile and the monkey.

(*c*) A monkey weighing 8 cwt. falling 7ft. has just before striking the head of the pile 56ft.-cwt. of energy, but before coming to rest it falls a further foot; the energy we have to do with is therefore 64ft.-cwt. The constant opposing force which would bring it to rest in the distance of 1ft. would be a force of 64 cwt., and this may be taken to be the average pressure. Owing to the imperfect elasticity of the monkey and the pile, and the mass of the pile, the *effective* average pressure is always less than the average pressure at the head, though it is frequently taken to be the same.

(*d*) When the pile is not noticeably moved the effective pressure is nought, though the average pressure is very great; such a blow very seriously tries the strength of the material of the pile; if we assume that the deformation of the monkey is very small compared with that of the pile, it would be possible to measure the short distance through which the head of the pile moved downwards during the period of impact, and in this way an estimate might be made of the average pressure: it is $\frac{\text{Energy ft. lbs.}}{\text{distance.}}$

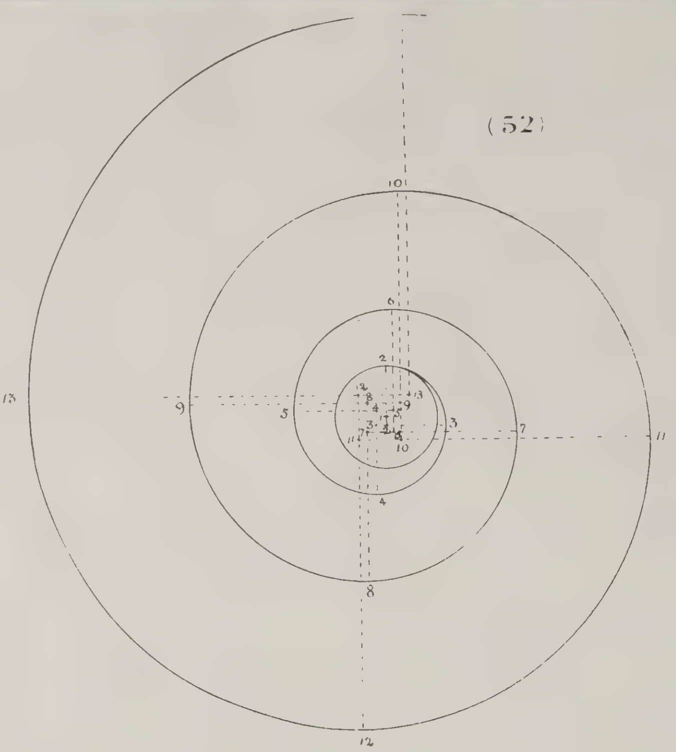
(*e*) There is some difficulty in getting exact notions of the two different qualities of a moving mass—(1) its momentum and (2) its kinetic energy. Momentum is produced by the action of force during time, kinetic energy by force through a distance. Neglecting any further falling of the monkey after impact, there is exactly the same quantity of kinetic energy delivered, if we assume that there is no rebound of the monkey, to the pile by each of the two monkeys; the momenta are however different:—

$$\frac{\text{The momentum of first monkey}}{\text{The momentum of second monkey}} = \frac{\sqrt{7}}{\sqrt{14}}$$

$= \frac{1}{\sqrt{2}} = \frac{5}{7}$ approximately. If we imagine the pile to be a free body and that the monkey strikes it without rebound, the momentum of the combined monkey and pile is the same as that of the monkey before impact, but if we figure it out we shall find that the energy is very different; a very considerable quantity of energy has disappeared; this energy has been converted into heat in the head of the pile, and the head of the pile may have been bruised and damaged. It is not at the head but at the point of the pile that we want the energy made use of; it is the remaining energy which is effective at the point of the pile. We shall find on trial, assuming different weights of monkeys and piles, that this balance of energy usefully available at the point of the pile is always greater the lower we keep the momentum of the monkey relatively to its kinetic energy at impact. A heavy monkey, with a short drop, is more efficient than a light monkey with a long drop.

*52. Trace, in ink, the Ionic volute curve shown (see next page) and the words "Ionic volute." (This curve is a series of quadrants of circles: it is important—for full marks—that the line shall be uniform and that no points of junction shall show.) (45)

The tracing of this curve is a sharp test of neatness and accuracy in handling drawing instruments. The first thing to be done is to find the centres from which the quadrants are drawn: the centre of the complete circle is easily found; we have not the exact point where the spiral springs from this circle; we know from the question that there is a complete quadrant all of the same curvature. From this we find the radius and the centre by trial, trying with the pencil point in the compasses; the line joining the centres should pass through the exact point of tangence; we are helped to adjust this line of centres when we try the curve past the point of tangence to the left in pencil. If we start fair with the first quadrant, knowing that the portions of the curve are exact quadrants, the successive centres are not difficult to find. The centres being marked on the drawing to be traced, and the junctions of quadrants also marked upon it, the tracing paper should be laid upon it and fastened down. The centre circle should be first drawn; the first inner quadrant should be drawn in the direction of the hands of a clock from the point of tangence, and so on. The line should not be too fine; the examiner tests the tracing by placing it over the drawing, and if the line of the tracing is very fine he can detect the slightest variation. On the other hand, to make a good heavy line showing sharp on both edges and uniform in breadth everywhere requires steady, careful manipulation.



Ionic Volute.
(Note.- Dotted lines belong to the Solution)

Views and Reviews.

Architectural Perspective.

Those who have read Mr. Middleton's little book entitled "Linear Perspective" must have been struck with the remarkable clearness with which he had explained what is often considered a difficult subject, and that too in a very small space. It was also an extremely cheap book. The edition having run out of print, Mr. Middleton has, instead of issuing a second, rewritten and extended the book. While somewhat more complete, there has been no sacrifice of lucidness—the illustrations, in fact, being to larger scale are clearer, and several additional practical examples are given. A chapter has also been introduced on isometric drawing, which is not commonly found explained in text-books, though often an extremely useful method. The concluding chapter deals with the preparation of finished perspectives, and is illustrated by a series of drawings by Messrs. E. Guy Dawber, C. E. Mallows, R. Phené Spiers, H. Inigo Triggs and others. Most useful chapters, too, are those on the delineation of curved objects, interpenetrations, interiors, bird's-eye views, the centrolinead, shadows from local sources of light and from the sun and reflections. Mr. Middleton's book is the most practical treatise on architectural perspective we have yet seen.

'The Principles of Architectural Perspective, prepared chiefly for the use of Students." by G. A. T. Middleton, A.R.I.B.A. London: B. T. Batsford, 94, High Holborn, W.C., price 2s. 6d. nett.

Machinery.

This book is an extremely able treatise on a difficult and somewhat abstruse side of machine design. The author is an instructor in mechanical engineering in the University of California, an Assoc. M. Am. Inst. of Elec. Engineers, &c., and, like most of the American professors, is far more lucid than our own professors in the most intricate explanations. Of course this book is somewhat difficult to understand from the very nature of the subject. It will undoubtedly be of more use to the student than to the practical engineer. The first two parts embody the more important principles of what is generally called the kinematics of machinery, though in many instances dynamic problems which present themselves are dealt with; the real purpose of the book being the application of the principles of mechanics to certain problems connected with machinery. Part I. is introductory, and Part II. discusses machinery of transmission. In the third part of the book the author discusses the mechanics of the steam-engine, as that machine is the most important from a designer's point of view; here the subject is treated under the two distinct heads of kinematics and dynamics. Kinematics is, of course, that branch of mechanics which deals with motion without reference to the cause producing it, and is important with machinery, where motion is entirely independent of the direction of the acting forces.

"An Elementary Treatise on the Mechanics of Machinery, with special reference to the Mechanics of the Steam Engine," by Joseph N. Le Conte. London: Macmillan & Co., Ltd. Price 10s. 6d. nett.

An Epoch-making Committee.

Under the authority of the Engineering Standards Committee Messrs. Robert Atkinson (London), Ltd., Salisbury House, London Wall, E.C., are preparing and issuing codified lists of the committee's findings in a form which should prove of great assistance to all buyers and sellers of British engineering sections throughout the world. To render this publication a standard work of reference, arrangements have been made to include in it complete lists of the manufacturers and merchants who roll or stock the standard sections. A pamphlet giving a short history of the committee and its work has just been compiled by Mr. Robert Atkinson. After concisely stating the development of the committee from the suggestion made by Sir John Wolfe Barry, the energetic support given by the engineering societies, and latterly by the Government, the names of those experts constituting the several sub-committees are given. The committee on bridges and general building construction is made up as follows:—Sir Benjamin Baker, K.C.B. (chairman), Colonel Sale, C.M.G. (representing the War Office), G. L. Eyles, C.M.G., and W. Shelford, C.M.G. (representing the Crown Agents for the Colonies), Max am Ende, Thomas Blashill, Alexander Buchanan (Handyside & Co., Derby), W. H. Panton (Dorman, Long & Co., Middlesbrough), F. E. Robertson, C.I.E. (Sir A. M. Rendel & Co.), H. J. Skelton (H. J. Skelton & Co.), J. Hamilton Turner (P. & W. Maclellan, Ltd., Glasgow), and J. E. Tuit (Sir William Arrol & Co., Glasgow). The labours of this committee have been confined principally to drawing up a series of standard beams and tees, and to the consideration of "equal and unequal angles," so as to meet all the requirements of general building construction. The standard list of beams includes only thirty sections, a considerable reduction from the large number formerly in vogue. It is a noticeable feature that some of the leading firms have already informed their customers that they are re-turning their rolls to comply with the new standard list issued by the committee. The committee on cement is made up as follows:—W. Matthews, C.M.G. (chairman), Bertram Blount (representing the Institute of Chemistry), H. W. Anderson, M. Fitzmaurice, C.M.G. (London County Council), A. Lyster (Liverpool Docks), J. A. McDonald (Midland Railway Co.), V. De Michele, W. W. Squire (Bristol Docks), M. F. Wilson (Dover Harbour Works), G. W. Yourdi (Birmingham Corporation Waterworks), B. P. Ellis (John Aird & Co.), E. Pearson (S. Pearson & Son, Ltd.), J. Warbrick (Sir John Jackson, Ltd.), H. K. Bamber, E. W. Brooks and O. L. Ellis (Associated Portland Cement Manufacturers), and C. A. Watson (J. C. Johnson & Co., Ltd.). Mr. Matthews is the engineer of the important harbour now under construction at Dover.

The New Architecture

Under the title of "The House Beautiful" Mr. R. Brimley Johnson, of 4, Adam Street, Adelphi, W.C., is now issuing "a monthly portfolio of designs in architecture by modern artists of all countries," price 2s. nett Some particulars of the first part will serve to show what kind of a publication it is. There are eight sheets, measuring about 14in. by 12in., enclosed in a green wrapper bearing an attractive design. Of the eight plates (printed at Stuttgart, in colour) four are by German architects, two from Vienna, one from Antwerp, and one from Paris—all in more or less "Art Nouveau" manner. Some of them are inclined to be wild in treatment, but the majority at least show that this new art, when kept within bounds, lends itself to much pleasant decoration. One thing can almost always be said in praise of "Art Nouveau"—it embraces the most delightful colour schemes.

Graining and Marbling.

There are many indications that the age of graining and marbling is passing away, for, with a truer perception of the arts, it has come to be regarded that men should spend their time and skill on something better than making one wood an imitation of another, or deftly giving plaster the appearance of marble. The author seems in a way to be conscious of this, though in his preface he endeavours to cover himself with the futile contention that "the imitation of wood and marble is always allowable where wood and marble would be employed by the architect." But these misguided trades still persist, and while they do there must needs be a demand for instruction in skilful trickery with paint and varnish. This series of plates is to be issued in fourteen parts, price 3s. 6d. each. The part before us has four large plates showing the four stages in the production of "Rouge Grotte"; they are admirably printed and serve their purpose well in showing how the work is proceeded with stage by stage, instead of simply depicting the finished sham.

"The Practical Arts of Graining and Marbling," by J. Petrie. London: The Trade Papers Publishing Co., Ltd., 365, Birkbeck Bank Chambers, High Holborn, W.C

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Determining Weight of Glass.

SWINDON.—W. B. writes: "Is there any means of determining the quality of sheet-glass after glazing without taking out the glass?—say the difference between 21oz. and 26oz."

The most obvious way is to try the weight of a glazed sash by means of a spring-balance. You will require to know the weight of an unglazed sash and the weight of putty, but you should be able to approximate to these. If the glass area of a sash is 9 sq. ft. the difference between 21oz. and 26oz. glass is 45ozs., nearly 3lbs., which is a considerable weight. If this method arouses suspicion you should take a pane out of a particularly light sash (if the glazing is fresh this will not be difficult) and weigh it.

P.

Dimensions for a Spring Jumping Board.

BRIGHTON.—E. H. writes: "I have to make a spring board for a small gymnasium. The sizes are:—Length of head 5ft., length of run 4ft. 6in., height of head 9in. What width and thickness of ash should be used? I was going to make the board according to sizes given me, the head-piece being ash 5ft. by 9in. by 2in., the running board of deal 4ft. 6in. by 16in. by 1½in., the blocks at each end being 12in. by 3in. by 9in.—all bolted together."

The dimensions proposed, namely, spring board 9in. by 2in. ash 5ft. long, running board 16in. by 1½in. deal 4ft. 6in. long, and blocks 12in. by 3in. by 9in., will do, but will be rather stiff. A man weighing 12 stone = 1½ cwts.; stepping on suddenly gives double load = 3 cwt.; jumping gives treble load – 4½ cwt. The breaking weight of an ash board 9in. by 2in. and 5ft. span is $\frac{6bd^2}{L} = \frac{6 \times 9 \times 2^2}{5} = 43{\cdot}2$ cwt. in centre. The actual load in centre will be 4½ cwt. Therefore the factor of safety will be $\frac{43{\cdot}2}{4{\cdot}5} = 9{\cdot}6$. If the thickness of the spring-board be reduced to 1½in. the factor of safety would be reduced to $\left(\frac{1\frac{1}{2}}{2}\right)^2 \times 9{\cdot}6 = 5{\cdot}4$. The bolts fixing running board to spring-board should have round flat heads let in flush with double nuts below. The spring-board may be fixed to the blocks by coach screws. HENRY ADAMS.

Carpenters Company.

BOSTON.—J. B. J. writes: "What is the address of the Worshipful Company of Carpenters? How can I become a member of that body?"

Apply to the Clerk to the Company, Carpenters' Hall, London Wall, E.C.

Rough-Cast.

REIGATE.—S. writes: "What is the most satisfactory way to specify rough-cast? Should the first coat be of cement-rendering? If this is so, would it not be useless to mix any colouring matter in the final coat, owing to cement 'killing' all colour?"

The most satisfactory first coat is cement in which chalk can be mixed to give a white colour. A good hydraulic blue lias lime is the next best matrix. Colours may be mixed with the cement without being killed, but the effect is not good.

Stone used at Owens College, Manchester.

MERFIL writes: "What stone was used for the late addition to Owens College, Manchester, and from what quarry was it obtained?"

Whitworth Hall at Owens College, Manchester, opened by the Prince and Princess of Wales in March, 1902, is built of Minera stone, the same as that used in the rest of the college buildings.

American Architectural Journals.

MOTHERWELL. — SCOT writes: "Kindly name an American architectural paper, and tell how to get it."

We have several times given particulars of the several architectural journals published in New York and Boston: see p. 33 of our issue for August 28th, 1901. Perhaps the "American Architect" (weekly, 50 cents—eight dollars a year post-free to this country; 211, Tremont Street, Boston, Mass.) will serve your purpose.

Salary of Estate Architect.

BOSTON SPA.—G. W. C. K writes: "What is the average salary paid to architects on landed estates?"

It would be extremely difficult to draw an average for such a case. The salary depends upon the estate, the nature of the duties, the quality of the man filling the appointment and the liberality of the employer. Perhaps from £120 to £250 per annum would be the general run, while an architect to a town estate might make £1,000 or more.

HENRY ADAMS.

Architects' Fees.

GLASGOW.—G. B. writes: (1) "Can a percentage be fixed on a job costing £35 requiring scale drawings and details and seven visits of inspection, or is it customary to charge by time in such cases? (2) What rate can be charged on a job costing £373—alterations to a building with designs for fittings, &c., inspection?"

(1) No. It is usually charged according to the difficulty and time occupied. (2) There is no special rate; a fair charge would be about twenty-five guineas.

Clerk of Works under Government.

PETERBOROUGH.—WORKER writes: "To whom should I write respecting a position as clerk of works under Government?"

Appointments under Government as clerk of works are mostly obtained in open competition by payment of certain fees. They include appointments under the Office of Works, Prison Department, Post-Office, Admiralty, &c. In some of these it is necessary that the applicant should have had previous experience as a clerk of works. "The Civil Service Year-Book," to be obtained through any bookseller, gives all necessary information as to qualifications, fees, &c. Competitions are advertised in the papers, and competitors can obtain information relative thereto on application to the Civil Service Commissioners. T. P.

Use of Instruments.

BARNSTAPLE.—W. M. writes: "What are the following instruments used for: micrometer theodolite, telemetrical theodolite, prismatic compasses, clinometers levels, proportional compasses and protractors? What is the meaning of the plans and solids on a proportional compass, also the hooked points and bar adjustment? What is the meaning of the accompanying scale (not reproduced)?"

It would require a volume to answer the string of questions propounded, and many books are already written that will furnish the required information. See Walmisley's "Land Surveying and Levelling" ("Builder" office, 7s. 6d.) and Walmisley's "Field Work and Instruments" ("Builder" office, 6s.). The sketch sent shows an ordinary rectangular protractor for measuring angles, with the other usual scales upon it for measuring lengths. If a correspondent neither knows the name nor use of this instrument one could hardly begin to describe to him the construction and use of such instruments as the level and theodolite. After six months' study in a systematic manner from suitable books he will be better justified in asking for information on any point that is then doubtful. HENRY ADAMS.

Buildings to Measure at Devizes, Luton, Kendal and Bath.

DEVIZES.—WILTS writes: "Kindly mention some buildings in Wiltshire (preferably Devizes or district) to measure for sheets Nos. 4 and 5 for R.I.B.A. Intermediate."

The church of St. John, Devizes, is one of the most interesting in the country. In the north wall of the chancel is an original semicircular window. The south-east chapel is Decorated work. At St. Mary's, Devizes, the south porch is a splendid example of Early English work. The nave is Perpendicular, and is also very fine. St. James' Church at Trowbridge is a fine old church which dates back from the fourteenth century and has an exceedingly fine font. M.

LUTON.—S. E. writes: "Kindly name some buildings near Luton worth measuring and sketching."

At Dunstable there are excellent remains of an ancient priory, and in the church are some excellent Early English portions in the west front, with a small portion of Decorated work. In the interior there is a splendid Perpendicular wood screen. At All Saints' Church, Leighton Buzzard, the tower and spire and most of the walls of the aisles are good Early English, as are also the nave piers, arches and doors. There are also some very good Perpendicular windows. St. Mary's Church at Luton has a good Perpendicular tower, and a very fine pier of Early English work in the north aisle and a good example of the Decorated period in the baptistery chapel. All Saints', Houghton Regis, has a Decorated chancel and a good Perpendicular tower, and the five bays of the nave have Decorated arches, with Perpendicular clearstory. M.

HIPPERHOLME.—CURIOUS writes: "Please suggest some buildings suitable to measure for the R.I.B.A. Intermediate, at or near Kendal and also at Colwyn Bay."

There is, so far as I can ascertain, nothing suitable in either district. G. A. T. M.

PORTOBELLO.—PORTO writes: "Which are the best buildings to measure in and around Bath, not including Wells?"

Probably the best Early work is to be found in the ruins of Glastonbury Abbey, of which the blind arcade towards the east end of St. Joseph's Chapel would serve your purpose admirably. The detail is of the purest early thirteenth-century style, though the western end of the chapel is earlier. Shetching is permitted so long as the admission fee is paid. One of the doors of Bath Abbey (late Perpendicular) might also be a useful study, while there is a Decorated window easy to measure at Amesbury. There is also plenty of good modern work by Mr. J. M. Brydon in Bath, and the Roman baths are worthy of careful study. G. A. T. M.

A Memorial at Guy's Hospital has been erected to those members of the hospital who were killed or died from disease in South Africa. It takes the form of a drinking fountain in coloured and polished marbles, designed by Mr. Frederick Wheeler, of Staple Inn. The bronze inscription, panels and mountings were supplied by the Coalbrookdale Company. Messrs. John Daymond & Son executed the work.

MODERN LONDON BUILDINGS.

(*Continued from* p. 241, *No.* 434.)

A list of public and semi-public buildings in the E.C. district was published in our issue for March 25th, of domestic and religious buildings, colleges and schools in the same district in the issue for April 1st, *of business premises in the same district in the issues for April 15th, April 29th and May 13th, and of hotels, restaurants, &c., in the same district in the issue for May 13th. A list of public and semi-public buildings in the E. district was published in our issue for June 3rd.*

E. DISTRICT: RELIGIOUS BUILDINGS.

Building.	Architect.	Approximate Cost.	Remarks.
1876.		£	
St. Margaret's Church, Barking Road, Plaistow.	F. W. Tasker	3,300 (exclusive of tower).	Brick is used for the general walling, the dressings externally being of Portland stone and internally of Bath stone. The church is groin-vaulted in brick throughout, and the style adopted was twelfth-century Gothic. The nave and sanctuary consist of four bays, 20ft. 6in. from centre to centre. The eastern bay is apsidal, and the accommodation provided is for 325 sittings.
1877.			
Christ Church, Jamaica Street, Stepney.	Ewan Christian	—	
Church of St. Mary (on the site of Old Parish Church), Whitechapel.	Ernest C. Lee	18,000 (exclusive of spire).	The church is built of Suffolk red bricks, with Doulting-stone dressings. The accommodation is for 1,300 persons, and there are nave 110ft. long by 38ft. wide, aisles 13ft. 6in. wide, chancel 37ft. 6in. long by 27ft. wide, and a tower and spire 200ft. high. The height of the building is 80ft. to ridge. Mr. Earp, of Lambeth, did the carving.
Church of St. Saviour, Walthamstow.	F. T. Dolphin	—	
1879.			
All Hallows' Church, East India Dock Road, Poplar.	- - - -	—	
St. Antony's Church, near Mile End Road.	Ewan Christian	9,700	The general walling is of yellow-stock brickwork, with stone dressings. Internally the shafts of the nave arcade are of grey pennant stone, with Bath-stone caps and bases. The accommodation is for 700 worshippers, the church being 125ft. long by 65ft. wide.
1880.			
St. Augustine's Church, Settle St., Commercial Rd.	Newman & Billing	7,500	There are 600 sittings. The building measures 96ft. by 53ft., and is of stock bricks and Bath stone.
1881.			
Böhler Memorial Chapel, Commercial Road.	E. Early Hollis	3,900	The ground floor consists of a school for boys and girls. The chapel is 59ft. by 37ft. 6in., and has a flat-curved ceiling 30ft. from the floor.
1883.			
Poplar and Bromley Tabernacle.	W. Allen Dixon	3,284	The tabernacle is 50ft. wide and 76ft. long by 40ft. high If provides accommodation for 1,000 persons, and is in the Byzantine style, the walls being of stock brickwork with white and red brick bands, and the columns of the portico of Bath stone.
1884.			
St. George's in the East Mission House.	Keith D. Young	—	The house accommodation includes a gymnasium in the basement, infants' Sunday school, kitchens, &c. The hall is in the rear, and is intended for the purpose of concerts, entertainments, &c.
1885.			
Church of St Thomas, West Ham.	J. Oldrid Scott	8,000	The style adopted was Decorated Gothic, and the accommodation is for 830 persons. The church itself is 15ft above the road level, the under portion forming six classrooms and vestries. The building is of brick inside and out. There is a tall turret at the south-west corner, and the nave and choir are under one roof.
1887.			
German Protestant Church and Schools, Goulston Street, Whitechapel.	H W. Stone	10,000	In the basement is a lecture-hall to seat 500 persons, and also a well-lighted play-room for the school children. The church seats 350 worshippers. The frontage of the buildings is 200ft., carried out in yellow brickwork and Bath stone.
1890.			
St. Frideswide's Church, Follett Street, Poplar.	R. Willie	3,600	This building was erected for the Christ Church Oxford Mission. It accommodates about 600 persons, and is of brick, faced externally with red bricks, with Chilmark-stone dressings. The nave and chancel, under one roof, are 38ft. wide by 91ft. in length. The style is Early English, with lancet windows.
United Methodist Free Church, Manor Park.	Potts, Sulman & Hennings.	—	The church consists of a nave and aisles 40ft. across, intersected by aisled transepts of equal height and width. Seating is provided on the ground floor for 475 persons. The materials are red bricks, Bath stone and green slates. The style is Gothic.
1891.			
"Bermondsey Settlement" Buildings (for Religious and Social Work), Farncombe Street, Bermondsey.	Elijah Hoole	—	The buildings which are to form the "Settlement" contain a lecture-hall, classrooms, students' library and reading-room, chemical laboratory, workshop and a gymnasium, together with a warden's house and a residence for about twenty men.
Church, Red Cross Street, Borough.	F. A. Walters	7,000	The church is 132ft. by 42ft., Romanesque in character, and built in brick. The accommodation is for 700 persons.
1892.			
St. Philip's Church, Stepney	Arthur Cawston	40,000	The general wall facings are of stock brickwork, relieved with Bath-stone dressings. Ancaster stone is used externally, with red brick for the walling. The lady chapel is of Sussex stone, with a central column supporting the vaulting, which is of Hopton Wood stone.
1893.			
Mission Hall, St. Andrew's Presbyterian Church, Philpot Street, Whitechapel.	Alfred R. Pite & Son.	—	Large waiting- and reading-rooms are provided in the basement for the use of patients, and meeting-rooms are provided on the ground floor, the other part being adapted to mission purposes.
Roman Catholic Church Schools, Bow Common.	Fredk. A. Walters	—	The church is in the thirteenth-century style and accommodates 800 persons; the schools are arranged for 500 children.
St. Mark's Church, Forest Gate.	E. P. Loftus Brock	—	Accommodation is provided for 400 persons. The building is of brick, with external angles and arches of red brick. The walls internally are plastered.
1896.			
St. Clement's Church, South Grove, Ilford	J. E. K. & J. P. Cutts.	8,000	This building is in the Early English style and is built of red brick. It accommodates 900 persons.
St. Matthew's Church and Parochial Hall, West Ham.	E. P. Loftus Brock	Church, £4,300 Hall, £680	The style is Gothic, of late thirteenth-century date and the walls are constructed with flintwork, with yellow brick quoins, reveals, patterns and bands of brickwork. The principal windows are traceried and the roof is covered with red tiles. The accommodation is for 650 persons. On the north side of the church is the parochial hall, with classrooms, kitchen and offices.
1897.			
Church of St. Michael and All Angels, Little Ilford.	Charles Spooner	7,000	The church has nave and aisles, spanned by a single hammer-beam roof; a chancel, with narrow aisles; side chapel on the south, vestries and organ transept on the north; and a baptistery and two porches at the west end. The walls are of red brickwork, and the roofs and weatherings of the buttresses are covered with red tiles. The mullions heads and jambs of the windows and nave columns are of Bath stone, with red-brick arches and stone springers.
1899.			
Hambro Synagogue, Union Street, Commercial Road, Whitechapel.	Lewis Solomon	4,000	Accommodation is provided for more than 400 persons.
1900.			
Congregational Church, Stamford Rd., East Ham.	J. D. Bould	—	
St. Andrew's Church, Bromley-by-Bow.	W. D. Caröe	6,500	The church will accommodate 600 worshippers. The external materials are red brick and red tiles, stone being used in the interior.
St. Edmund's Church, Halley Road, Manor Park.	J. E. K. & J. P. Cutts	4,700	The church will eventually consist of chancel, gabled chancel aisles—that on the north being planned for a morning chapel, the south aisle containing the organ, vestries, nave, aisles and west porches. The portion erected is the east end, with seating accommodation for 500 persons. The building is faced with red bricks, with Bath stone dressings and tiled roofs.
St. Mary's Church, Plaistow (additions).	Wadmore & Mallet	—	The additions comprise a new north aisle.
St. Matthew's Mission, Church, Vicarage Lane, Stratford.	George Baines	—	A simple treatment of Early Gothic is adopted for the design. A narthex containing two main entrances relieves the front elevation. The chancel arch is of Bath stone, carried on columns of the same material. The roof is open-timbered, of hammer-beam construction, with boarded ceiling. The vestry stands by the side of the chancel. Class-rooms, kitchen and other conveniences are placed in the basement.
St. Nicholas's Mission Church, Blackwall Stairs Poplar.	Messrs. Clarkson	—	Attached to the church are a large recreation-room, kitchen, and a committee-room which serves as a church vestry. The church is of red brick inside and out, with very little stone. The roofs are of slate. There are six bays, having a total length of 65ft. and a width of 35ft. The height from floor to apex is 50ft At the east end is a spacious apse about 30ft. across, covered by a semi-dome. The walls of the attached buildings are of yellow brickwork, and the openings have flat arches.
Wesleyan Church, Romford Road, Manor Park.	Charles Bell, Withers & Meredith.	3,800	The church seats about 424 persons on the ground floor and 200 in the gallery which runs round three sides.

E. DISTRICT: RELIGIOUS BUILDINGS—*cont.*

Building.	Architect.	Approximate Cost.	Remarks.
1901.		£	
Baptist Church, Plashet Grove, East Ham.	Edgar Stones	9,000	
Congregational Church, Wakefield St, East Ham.	Mould & Parritt	4,800	The church will seat between 700 and 800 persons, and has attached classrooms for Sunday schools, &c.
1902.			
Church of St. John, Seven Kings, Ilford.	- - - -	1st portion, £2,329 Total £7,000	The church is in the Perpendicular style, freely treated. The materials used are brick and Bath stone. The building will accommodote 802 persons when completed. The present portion, consisting of chancel, side chapel, organ-chamber and two bays of the nave and aisles, will accommodate 480.

E. DISTRICT: COLLEGES AND SCHOOLS.

Building.	Architect.	Approximate Cost.	Remarks.
1876.		£	
Board Schools, Knapp Road, Bromley-by-Bow.	E. R. Robson	7,362	The schools are designed to accommodate 841 children, at a cost of £8 15s. 1d. per head. The style of the buildings is Queen Anne.
Board Schools, Bonner St., Green St., Bethnal Green.	E. R. Robson	9,098	These schools accommodate 814 children, and are designed in the Queen Anne style.
1877.			
German Lutheran Church Schools, Whitechapel.	E. A. Grüning	5,000	The schools accommodate about 600 children.
1880.			
Board School, Farrame Street, Limehouse.	E. R. Robson	9,873	The schools accommodate 1,200 children, and were erected at a cost of £8 4s. 6d. per head.
1881.			
Board School. Oban Street, Tower Hamlets.	E. R. Robson	18,244	The style of the design is Gothic in tendency. The schools will accommodate 1,400 children.
1883.			
Board Schools, Hayne Street, Bethnal Green.	E. R. Robson	11,410	The accommodation is for 1,200 children.
1884.			
George Green's Schools, Crisp Street, Poplar.	John Sulman	10,500	The schools comprise a large lecture-hall to seat 600 persons and six classrooms to hold 200 boys, with the same number of rooms for girls below. The buildings consist of two blocks. The roof is an asphalted flat, serving the purpose of a playground for the girls. Red bricks and Portland stone were used.
1885.			
Board School, Denmark Street, Plaistow.	S J. Newman	10,800	The accommodation is for 1,272 children.
Gower's Walk Free Schools, Rupert St, Whitechapel	Ernest C. Lee	—	The schools will hold 184 children. They are faced with stock bricks and have red-brick dressings. Messrs. Earp, of Lambeth, were responsible for the carving.
Raines' Charity Schools, St George's-in-the-East.	Wilson, Son & Aldwinckle	3,600	The style adopted was a free treatment of French Renaissance, carried out in red brickwork, with red Dumfries stone dressings. Accommodation is provided for 350 children
1886.			
Berner Street Board Schools, Commercial Rd.	T. J. Bailey	13.300	The accommodation is for 1,200 children.
1894.			
St. Stephen's Sunday Schools, Saxon Road, Bow	Holmes	2.000	
1895.			
Board Schools Star Lane, Canning Town.	Newman & Jacques	18,220	The schools, which consist of a ground floor and two storeys above, will accommodate 1,566 children. There is a caretaker's residence on the site, adjoining which is a building fitted for instruction in laundry-work and cookery.
The Horns Board School, Birkbeck Estate, Ilford.	C. J. Dawson	1,800	The school will accommodate 130 children and is built of stock bricks with buff terra-cotta bands, coping and finials; the roof is covered with Broseley tiles. A lead-covered bell-turret rises from the roof.
1896.			
Board Schools, Cleveland Road, Ilford.	C. J. Dawson	—	The buildings, which form a block three storeys high, are designed on the classroom and central-hall system. The total accommodation is for 1,614 children. In each storey is a central-hall 65ft. by 32ft. The exterior is in blue Staffordshire bricks and moulded-facing bricks, picked out in buff terra-cotta. The floors are of steel and concrete construction, and are covered with wood blocks.
Extension of the Coopers' Co.'s School for Boys, Tredegar Sq., Bow Rd.	H. Chatfield Clarke	2,000	The new rooms are in a separate block added on to the existing school buildings, and are on two floors. On the ground floor, the physical laboratory occupies the front portion of the wing and a mechanical workshop and dark-room in rear. On first floor are a chemical laboratory & a lecture-room, with preparation and store-rooms attached.
1897.			
Board School, Essex Road, Little Ilford.	S Jackson	14,168	The schools are designed to accommodate 1,582.
Boys' School. Newport Road Schools, Leytonstone.	William Jacques	8,772	The building contains accommodation for 600 boys on two floors, there being five classrooms on each floor. On the ground floor is a hall 60ft. long by 35ft. wide. Rooms for masters and assistants are placed on the upper floor. A caretaker's cottage is also provided.
1898.			
Coborn School for Girls, 31 & 33 Bow Road	George Elkington	13,000	The building is designed to accommodate 300 girls. The school is square on plan and has a central-hall, with classrooms ranging round it. The hall is top lighted and has an open timbered roof and a gallery at first-floor level. There are ten classrooms, each with good left-side light. On the lower ground floor is the pupils' entrance, with extensive cloak-rooms, two of the classrooms, three music rooms, dining-room to seat 100 girls, kitchen department, stores and cellarage. On the first floor is an art school and on the second floor a technical department, comprising a laboratory 42ft. by 21ft, The building externally is faced with red brick and Portland stone; the roofs are slated. Fireproof construction is employed for the floors.
Jews' Free School (Additional Wing), Spitalfields.	W. S. Joseph	20 000	
Public Technical Institute, Romford Road. Stratford.	Gibson & Russell	—	The structure and its environs occupy an acre and a half of land The body of the building is of red brickwork, heavily corniced and ornamented with masonry, the portico of the main entrance being supported on either side by carved figures. The institute is appointed with workshops, cookery school, laundry and a free library.
1899.			
The Sir John Cass School and Institute. Aldgate.	A. W. Cooksey	–	The ground floor contains a large lecture theatre, with accommodation for 225 persons, and four rooms for instruction in arts and crafts. The board-room and secretary's office are in close proximity. Upon the first floor there are classrooms, library and reading-room. The second floor comprises a chemical laboratory, a tailor's workshop and a women's department, including a laundry, cooking school and dressmaking-room. There is also a gymnasium. In the basement provision is made for the building and allied trades.
1901.			
The Park Higher Grade School, Melbourne Road, Ilford.	C. J. Dawson	16,710	This building is designed on the central hall and classroom principle. The ground floor, which is for the accommodation of 300 girls, consists of a centrall hall 68ft. long by 30ft. wide, around which are grouped six separate classrooms and a head-mistress room, together with cloak- and dining-rooms. At the south end of this floor are cloak- and dining-rooms for boys, with an entrance leading to the first floor, where similar accommodation as that provided for girls is provided for 300 boys. The assistant-teachers' rooms, with lavatories, are arranged in mezzanines. The building externally is faced with yellow stocks with a blue-brick plinth, and with Cattybrook buff brick and terra-cotta bands, piers, arches, strings and cornices.
Wesleyan Sunday Schools, High Road, Ilford.	Gordon & Gunton	3,000	The building will accommodate about 550 persons, and consists of a classroom 50ft. by 40ft. and an infant's room 17ft. by 20ft. There are a church parlour and other rooms on the first floor. The building is of brick, with Bath stone-dressings, and is about 30ft. high.
Working Lads' Institute, Whitechapel (additions).	George & R. P. Baines.	1 300	The additions to the institute comprise a new lecture-room and apartments for the caretaker in the rear.
1902.			
School for Crippled and Mentally-Deranged Children, Grange Road, West Ham (in course of erection).	W. Jacques	6,703	The site has frontages to Bethnal Avenue and Hermit Road recreation-ground. The school is situated next the Grange Road Board Schools, from which, however, it will be quite distinct. The building comprises two separate schools—that to the south, for eighty imbecile children, contains four classrooms, each 20ft. square, with a small hall 40ft. by 20ft. The western wing contains the school for forty cripples. It comprises two classrooms, each 20ft. square, and a small hall.

[At the end of the list given on p. 241 of THE BUILDERS' JOURNAL for June 3rd, the architects of the new buildings at the North-Eastern Hospital at Hackney were stated to be Messrs. A. & C. Harston. This is incorrect. The architects were Messrs. Marshall & Vickers. The description given applies to the North-Eastern Hospital (Metropolitan Asylums Board), St Anne's Road, South Tottenham, of which Messrs. A. & C. Harston were the architects.

Builders' Notes.

Book-keeping for Builders.—Mr. Frederick Corse, of 56, Theobald's Road, W.C., issues a booklet on "Account Books and How to Use them" (price 1s.)—a special feature of which is an explanation of book-keeping for builders and contractors.

The Northern Counties Federation of Building Trades' Employers, at a meeting held last week with reference to the strike of joiners at Sunderland for an advance of one halfpenny per hour wages, decided to lock out the joiners in the different towns affiliated if no settlement had been arrived at before the arrangements for a lock-out are completed.

The Building Trade in Kirkcaldy District at the present time is very depressed. For many years past building has been brisk, and owing to this fact the reaction will be all the more keenly felt. The whole of the large contracts have been practically finished, and now there are only a few small jobs on hand. Many masons have already left the district for Glasgow, Govan, Edinburgh and towns nearer home, where work is more plentiful.

Labour Disputes in 1902.—The Labour Department of the Board of Trade in its fifteenth annual report on strikes and lock-outs in the United Kingdom in 1902, and on conciliation and arbitration boards, states that on the whole the year was less affected by labour disputes than the preceding year. The building trades and the transport and dock labour group show a great reduction in the number of persons affected, while for a group so important as the metal, engineering and shipbuilding group the figures are remarkably small. Questions of remuneration were, as usual, the most frequent causes of disputes, though the preponderance of wages disputes was less marked in 1902 than in any of the years 1898–1901. Thus, of the total of 442 disputes of 1902, 267, or 60 per cent., arose under this head; but these embraced only 48·6 per cent. of persons directly concerned, as against 52·7 per cent. in 1901 and 61·4 per cent. in 1900. During the last four years there has been a marked decrease in the number of persons directly affected by disputes having advances of wages for their object, and a corresponding increase in those resisting reductions of wages. Disputes as to hours of labour were of comparatively little consequence, but a large number of workpeople were engaged in disputes arising out of refusals to work with non-union men and other questions of trade-union principles, the proportion so involved being 21·8 per cent. of all those directly engaged in the whole of the disputes of the year.

Labour in the Colonies.—The Emigrants' Information Office, 31, Broadway, Westminster, S.W., states that in Canada nearly all trades, especially the building, metal and engineering, and wood-working and furnishing trades have been well employed, and in some parts there is a dearth of skilled labour, but not in British Columbia or in the iron and steel works at Sydney (Cape Breton). Emigrants are advised not to go to New South Wales at the present time on the chance of getting work. In Victoria the effects of the drought continue, and there is no demand for labour. The report of the Royal Commission on the Factories and Shops' Law which has just been issued recommends the establishment of Courts of Conciliation and an Arbitration Court, in place of the present Wages Boards; the report also draws attention to the "marked decadence of industrial efficiency" in the higher-class trades and industries "owing to the increasing number of poorly-trained workmen in the ranks of the younger generation," and recommends "that a system of indentured apprenticeship be made compulsory in all the principal trades and manufacturing industries, and that facilities for technical instruction be increased. In South Australia there is practically no demand for more mechanics in the towns, but a skilled hand such as a mason, bricklayer, engine-fitter, blacksmith, joiner or carpenter can generally find employment after looking about for a little. In Queensland there is no demand in the building trade. In Western Australia there is little demand for mechanics, but competent men in the building trades (except masons) can get work at Perth, Northam and elsewhere There is no demand for them at Fremantle, Coolgardie or Albany. In New Zealand the building and engineering trades have been busy in nearly all the principal places. In Natal a good deal of work is going on in the building and other trades; and though the local supply of labour has been largely increased by many new arrivals, specially skilled men, if they land with a little money, should be able to procure work without difficulty. As to the Transvaal, carpenters at Pretoria have struck for a minimum standard of £6 16s. a week. The building trades continue brisk, and good carpenters and bricklayers can obtain work, but there is no opening for inferior or unskilled men. Plasterers and stone-cutters (freestone) are in demand. There is a fair demand for first-class painters, but none whatever for rough painters; they must be thoroughly good men, capable of mixing their own paints, &c In the Orange River Colony there is a fluctuating demand for good carpenters, masons, fitters and painters, and men's wages have been recently raised to 2s. 6d. an hour.

Keystones.

The Campanile at Massa, in Tuscany, was struck by lightning last week and badly damaged.

Ventilating and Heating.—Messrs. E. H. Shorland & Brother, of Manchester, have just supplied some of their patent warm air ventilating Manchester grates to the Infectious Hospital, Warrington.

City Orthopædic Hospital. — The Committee of Management are carrying out considerable improvements and additions to the premises in Hatton Garden, consisting of new isolation ward, registration and consulting rooms and nurses' cubicles. The architect is Mr. F. T. W. Goldsmith, A.R.I.B.A.

Crathie Church has been undergoing considerable alterations by direction of the King. The roof was previously covered with slates, but the church has now been covered with red English tiles. A number of internal improvements is being effected. A carved oak canopy is to be placed over the pulpit. A niche is to be formed in one of the pillars opposite the pulpit, and in it is to be placed a bust of Queen Victoria.

A Memorial to Queen Victoria has been erected in the Market-place at Newbury. It consists of a statue of the late Queen about 8ft. high, including the plinth over which the robes are draped. The lower part of the memorial is on the plan of a cross, measuring 22ft. each way. On each side of the pedestals forming the arms of the cross is a recumbent lion 6ft. 3in. long. In the front recess stands a female figure representing "Fame" looking up at the Queen. The total height of the memorial is 28ft. The material used is Doulton's terra-cotta. The design was made by Mr. Arthur E. Pearce, and the statues and lions were modelled by Mr. John Broad. Both artists are on the staff of the Royal Doulton Potteries at Lambeth.

At St. Saviour's, Southwark, a memorial window has been erected in the north aisle to the late Mr. James Frederick Field, surveyor and auctioneer, of Borough High Street, who was assistant treasurer of the Collegiate Church and member of the chapter. It is designed by Mr. C. E. Kempe.

A new Catholic Church at South Bank is being erected from designs by Messrs. Brodrick, Lowther, and Walker, of Hull, Mr. Anthony Lyons, of Norton, near Malton, is the contractor. The building will accomodate about 700 workshippers. The cost will be between £7,000 and £8,000.

An Excellent Map of Peru, with particulars of the country, its organization, industries, &c., printed on the back, has just been issued under the authority of Don Eugenio Larrabure y Unánue, Minister of Foreign Affairs. Copies can be obtained from Mr. Eduardo Higginson, Consul for Peru at Southampton.

Truro Cathedral.—The top stone of the central tower of Truro Cathedral was laid last week. The tower will cost £15,000. Except for the two western towers, which are estimated to cost £7,000 each, and which will not be proceeded with until the money to pay for them is offered to the cathedral authorities, Truro Cathedral is now complete.

A Skycraper Forty-five Stories High.—Plans were submitted last week to New York city authorities for the building of a great city hall together with a railway station in Park Row and Chambers Street. The building is to have a great tower on the campanile plan forty-five stories high, or fifteen stories higher than any New York "sky-scraper." The total cost, including the ground, is estimated at £1,800,000.

Blackpool Competition.— The Blackpool Town Council have made the following awards on the competitive designs for a new technical school to be erected on the Raikes Hall estate, at a cost of about £17,000.—First (£50 premium), Messrs. Potts, Son & Pickup, Bolton; second, Messrs. Cheers & Smith, Blackburn; third, Messrs. Simon & Crawford, Manchester. Messrs. Potts, Son & Pickup were the architects for the new Town Hall at Blackpool.

New Public Buildings in London.—Mr. Victor Cavendish, as representing the First Commissioner of Works, has informed Mr. John Ellis in the House of Commons that the dates for the completion of the contracts for the fabrics of the new public buildings are as follows:—New War Office, June 26th, 1906; New Public Offices in Parliament Street, June 1st, 1907; Royal College of Science, June 1st, 1905; Victoria and Albert Museum, February 23rd, 1907; Admiralty (Block III.) (say) June 30th, 1906. (Contract about to be made for superstructure.) Such progress is being made with the above works as to justify an assumption that they will be completed by the specified dates. In some cases it is possible that the fittings will not all be finished, but every effort will be made to avoid delay.

The New Cloister at the Charterhouse which was inaugurated last week at Godalming has been erected as a memorial for Old Carthusians who fell in the South African war and in other British campaigns. In addition to the cloister a new transept to the chapel has been built. The cloister is built of stone, and is situated on the west side, being set out in bays corresponding with the existing buttresses, and following the lead given by the existing wall. The style is Gothic. The cloister will also afford a place of honour for the reception of other memorials of Old Carthusians. It is also proposed to place the statue of Dr. Haig Brown—now on the Green—in the cloister. The architect is Mr. W. D. Caröe.

Law Cases.

Building more than one House on a Lot of Ground.—The case of *The Ilford Park Estates, Ltd.* v. *Jacobs* was recently heard in the Chancery Division of the High Court of Justice. This was a motion by the plaintiffs for an injunction to restrain the defendant from erecting on certain lots in Brisbane Road, Ilford, Essex, more than one house within the meaning of a covenant contained in a conveyance dated November 14th, 1898, or any house of less value than £300, or any building whereof the elevation had not been approved in writing by the plaintiffs' surveyor upon any one of the lots. It appeared that the defendant submitted first of all an elevation and then an amended elevation of the proposed buildings to the plaintiffs' surveyor, who refused to approve them. The buildings were to consist of two floors. On the ground floor was one complete tenement with its own front door. On the upper floor was another complete tenement. Access to the upper floor was obtained through a separate front door opening on a staircase, which was divided by a brick wall from the ground-floor tenement. The two front doors were side by side, set back in an archway. The plaintiffs' surveyor alleged that these buildings, which the defendant was now proceeding to erect, were a breach of the stipulation that not more than one house should be built on any lot. Mr. Justice Swinfen Eady, in giving judgment, said the contention on behalf of the plaintiffs was that the defendant was putting up on one lot two houses which were separated horizontally and not vertically. It was not disputed that, if the defendant were erecting two semi-detached houses vertically separated they would constitute two separate houses, but it was contended that the building was in reality only one house. There was no internal communication between the ground floor and the first floor; there was no common staircase, as the ground floor did not require a staircase; and there was no common front door, but separate front doors for each of the two tenements. In order to pass from one house to another it was necessary to go out of the front door of one tenement to a space which opened upon the street and to enter the front door of the other. The language in which Lord Brampton in *Grant* v. *Langston* (1900, A.C., 383) described the building there in question was exactly appropriate to describe the building in the present case. At page 399 he said: "One roof covers the whole building, but each storey is so structurally composed and arranged for permanent occupation by a separate occupier that there is no internal communication of any kind between the two storeys, nor any common staircase or access to or from the street, or from any part of the outside of the premises, each having a separate entrance or entrances therefrom. In short, it would be impossible to erect two separate houses under one roof or to divide one building into two distinct and separate houses more completely than has been accomplished in the building now under consideration." Now, the question was whether each of these buildings constituted one or two houses. On the one hand, reference was made to the cases of blocks of flats. The first case was that of *Kimber* v. *Adams* (1900, 1 Ch., 412) before Mr. Justice Cozens-Hardy and the Court of Appeal, where the defendant had erected blocks of flats on the plots purchased by him subject to similar restrictions to those in the present case. There it was contended that each flat in a block of flats was a separate dwelling-house, but Mr. Justice Cozens-Hardy held that each block of flats constituted only one house. It appeared to his Lordship that in the present case there was merely one house superposed upon another house and divided horizontally. It was said that with certain modifications of the plans the buildings could be converted into flats. Whether that could be done or not was not for his Lordship to say. In his Lordship's judgment each building constituted two separate houses and was a direct breach of the covenant in question. There would, therefore, be an injunction in the terms of the notice of motion.

WORKMEN'S COTTAGES.

The Problem of the "Parlour"

At last week's meeting of the London County Council the Housing of the Working Classes Committee reported that in the planning of cottages they were obliged to take into account other factors than those which regulated their action in regard to block buildings. In particular, the persons who occupied these cottages insisted upon having one room in each tenement which could be set apart for occasional or ceremonial use only. The Committee thought, on the other hand, that the space, which was to a great extent wasted in the parlour or ceremonial room, might partially be thrown into the living-room or scullery. They referred to the case of "tenants on the Totterdown Fields Estate, who are using their kitchen-scullery as their living-room, and their living-room as their parlour. The total cubic space in these two rooms is 1,753ft., divided into living-room (parlour) 1,224 cub. ft., that is, 144 sq. ft., and kitchen-scullery (living-room) 529 cub. ft., that is, 74 sq. ft. Were they permitted to give a parlour of, say, 70 sq. ft., a kitchen or living-room of 148 sq. ft. could be provided, thus affording the same amount of cubic space, enabling the tenants to live under more healthy conditions, and at the same time meeting their very natural desire for a separate room in which could be secured that privacy which in the single living-room of a family is impossible. In a word, the Committee's object was to provide cottages similar to those which are built on the best managed estates in the country, such as those of the Duke of Bedford, Lord Portman and others. They do not desire in any way to compete with the jerry-builder, either in the reduction of the quality of the building or of the amount of cubic space, but simply to be able to rearrange the accommodation for the provision of more practical comfort for the Council's tenants." They recommended: "That, without in any way diminishing the quality of the constructional work in the Council's cottages, or curtailing the area of the living space provided, the Housing of the Working Classes Committee be permitted to rearrange the rooms so as to allow of the provision of the same number of rooms or cubicles of varying sizes in lieu of all rooms being of a compulsory minimum size."

An amendment to refer the report back was moved by Mr. R. Williams. Mr. Burns, M.P., said that personally he favoured an extension of the kitchen at the expense of the parlour. The average workmen's parlour was a mausoleum of wax fruits, family Bibles, and dusty antimacassars, and the only persons admitted to it were the doctor, the undertaker and the insurance man. Lord Carrington, chairman of the Committee, agreed that they must not abandon the standard of a 12ft. minimum for the living-room. They had four classes of cottages at Totterdown Fields. The first-class was of the sort which most people built on their own estates, comprising three bedrooms, a parlour, a living-room and scullery. The rent was high (11s. 6d. per week) but the cottages were popular, and the Council could let any number of them. The second and third classes, with diminished accommodation, were rented at 8s. 6d. and 7s. 6d. respectively. The fourth-class were flats containing one bedroom, one living-room and a small scullery in which there was a kitchen range. The Committee hoped that they would meet the demand of a very large class, but to their astonishment there was no demand at all. The amendment was rejected, and the Committee's report agreed to.

Upon the motion of Mr. A. Smith, it was resolved: "That, having regard to the urgent need of healthy dwelling accommodation for working people, it be referred to the Housing of the Working Classes Committee to consider the desirableness of putting into operation section 59 (part III.) of the Housing of the Working Classes Act, 1890, which gives power to acquire 'existing buildings,' and to 'alter,' 'enlarge,' 'improve' and 'convert' the same into dwellings."

The Historical Buildings Committee reported that their attention had been called to a proposal that had been made by Messrs. W. B. and F. Faulkner to erect in place of the Obelisk, St. George's Circus, an ornamental illuminated clock tower in commemoration of their long-standing connection with Southwark. They had communicated with the Council expressing the hope that, having regard to the historic character of the monument in question, the proposal would not be acceded to. The Obelisk was erected in 1771. The Southwark Borough Council had, they understood, accepted the proposal involving the removal of the monument.

L.C.C. Works Department.

The half-yearly return of the Works Committee, covering the cost of works completed by the department during the half-year ended March 31st last, has just been presented to the Council. It discloses some large and serious losses, but these are mainly in connection with the erection of Horton Asylum, Epsom, and the matter has already been fully discussed in the Council. The return deals with twenty estimated works, the final estimate for which was £591,790, while the actual cost has turned out to be £638,534, or a balance of cost above final estimate of £46,744. On only four of the works is any excess of cost over estimate shown, but in these cases the excess is £56,535. The cost of the building of the superstructure of the Horton Asylum has exceeded the estimate by £37,878, the final estimate being £291,165 and the actual cost £329,043. The erection of a central electric lighting station for the same asylum has resulted in an excess of cost over estimate of £1,977 on a job estimated to cost about £14,000. The provision of an "epileptic colony" on the Horton estate as an adjunct to the asylum has resulted in a balance of cost above estimate of £5,018. The other loss, which amounts to £11,617, is on the construction of the Hackney Wick relief sewer. This work was estimated at £125,329, and has actually cost £136,946. With regard to this work the Committee do not think that the ultimate cost is excessive, having regard to the difficulty of estimating accurately. The remaining sixteen works embraced in the return all show a balance of cost below estimate, the aggregate saving amounting to £9,791. The jobbing works executed by the Committee during the half-year have resulted in a balance of cost below schedule value of £1,334. In concluding their report, the Committee state that the number of works referred to them for execution and not included in the present return was forty-one, representing an estimated expenditure of, approximately, £739 000, but they did not anticipate an excess of cost over accepted estimate in respect of any works where the accepted estimate was over £1,000.

THE FIRE PREVENTION CONGRESS.

THE opening ceremony of the International Fire Prevention Congress by the Lord Mayor of London (Sir Marcus Samuel) took place in the Empress Theatre of the Earl's Court Exhibition on Monday last. It was a brilliant spectacle, by reason of his Lordship appearing in state and the great muster of foreign delegates wearing resplendent uniforms. The Lord Mayor, welcoming the delegates, stated his pleasure in being present at the opening of such an important Congress, and dwelt upon the benefits of international co-operation in dealing with fire matters. Lord Windsor associated himself, as a member of the Government, with the welcome extended by the Lord Mayor. He thought that in all matters of art and science there should be a free intercourse of ideas among the nations. The Hon. Thomas Cochrane, of the Local Government Board, also welcomed the delegates. He thought the work of fire-fighting one of the noblest in existence. Mr. E. O. Sachs then delivered the Congress Address. He said there were 800 delegates present, representing fifteen governments and 150 municipalities from all over the world. Never before in this country had a gathering been held at which architects, engineers, surveyors, municipal officials, legislators, insurance officials and fire surveyors met to take council with Fire Brigade chiefs and Salvage Corps officers. General preventive measures might be the result of private initiative, but as a rule they are required to be defined by the Government or local authority in Building Laws, Fire Protection Acts, Fire Survey Regulations, or, as in the United States and many Continental countries, set out in the publicly recognized schedules of insurance companies and mutual or municipal insurances offices. They were frequently supplemented by special rules for the treatment of extraordinary risks. These preventive measures were as a rule initiated and at times facilitated by the work of learned institutions or technical societies, such as the British Fire Prevention Committee. This Congress was convened by the Executive of this Prevention Committee. To expect any immediate public action, however necessary, as the outcome of the Congress work would lead to disappointment, but their deliberations would, he trusted, result in laying well and truly the foundations of several important reforms in the near future.

Sir Louis Lépine, G.C.V.O., Prefect of the Paris Police, expressed his pleasure in being present, and alluded to the excellent work of Mr. E. O. Sachs, the Chairman of the Executive. He expressed a hope that the Lord Mayor would visit Paris. On behalf of the French Government he made presentations of diplomas of honour to Mr. E. O. Sachs; Lieut.-Col. Fox, Chief Officer of the London Salvage Corps; Mr. Horace S. Folker, Hon. Sec., Fire Brigades Union, & Mr. C. Brasier, Chairman, London Private Fire Brigades Association. Prince Lvoff (Russia); Herr Giersberg, Commander, Fire Brigade, Berlin (Germany); Chevalier Goldoni (Italy); Mr. Charles Hexamer (United States) and Herr Czermack (Austro-Hungary) next spoke.

Sir William Preece, representing the Civil Engineers, said he spoke for a profession which largely contributed to the comfort and safety of man. He said the Congress was a great technical educational factor.

M. Dimitry G. Metaxas (Greece), proposed a vote of thanks to the Lord Mayor for presiding, Mr. E. O. Sachs supporting.

The general and sectional meetings of the Congress were begun yesterday, and will be continued to-day and to-morrow; a full report will appear in our next issue.

Bricks and Mortar.

Aphorism for the Week.

The function of the architect is to use a mass of practical knowledge to an artistic result.—BASIL CHAMPNEYS.

Our Plates. SOME particulars of Seacroft Golf Links Hotel at Skegness (the architects of which are Messrs. Brewill & Baily, of Nottingham) were given in our issue for May 13th last, when another view of the building was published as a centre-plate.—"Oakhill Drive," Surbiton, has just been completed. It is approached from Oakhill Road by a straight private drive 400ft. long (whence the house derives its name) having a carriage court at its termination on the north-west side of the house, where the entrance porch is situated. The kitchen garden has a frontage to the Kingsdown Road. The ground falls away considerably from the house on the garden side, so that the terrace, which is 30ft. wide, stands 5ft. above the level of the tennis and croquet lawns and has a brick retaining wall with steps. The facings to the house are of Crowborough bricks with red dressings. The bay windows of the dining-room and drawing-room are of Monk's Park stone and the rest of the windows of wood painted white. The copings and caps are of Robin Hood stone. The roof is covered with light sea-green Westmoreland slates from the Tilberthwaite Co.'s quarries in diminishing courses with lead ridges. The hall and staircase are lined with white panelling, and the doors of the principal rooms are of polished mahogany. A feature has been made of the loggia (or open-air room) facing south-west, which can be approached direct either from the drawing-room, billiard-room or hall; like the porch, vestibule, cloakroom, &c., it has a mosaic floor. Besides the accommodation shown on the ground plan, there is a sitting-room on the first floor opening on to the balcony over the loggia, which has a large awning to cover it, and ten bed- and dressing-rooms with three bathrooms, dark-room for photography, and the usual offices. The heating was carried out by Mr. Edward P. Milne, of 15, Craven Street, Strand, both the domestic supply and that for the radiators (though separate) being heated by Milne's patent "Duplex" boiler in the basement. The electric-light installation is by Mr. G. A. Steinthal, of Bradford; and the fittings by Mr. Montague Fordham, of 9, Maddox Street, W. Mr. Frank Hawkey, of Surbiton, was the builder, and Mr. Walter E. Hewitt, A.R.I.B.A., of 22, Buckingham Street, Strand, W.C., the architect, who also designed and superintended the laying-out of the grounds.

New Academy Rules. THE Royal Academicians have for some time had under consideration the regulations of their schools, and the deliberations of the council and the general assembly have resulted in the practical remodelling of the school laws, especially in so far as they affect the admission of students. One of the most important alterations is the abrogation of the law which prevented the admission of students above the age of twenty-three if painters, or twenty-five if sculptors or architects, a law which has only been in force since 1890. In future persons of any age will be eligible for admission to the schools, but no one who has passed his twenty-eighth year will be allowed to compete for a scholarship, prize or medal. Under the new rules painter candidates will have to submit a finished drawing in chalk from an antique statue, a drawing of a full-length figure from the life, a painting of a head, life-size, from the life, and a design for a composition. Should these be accepted he must execute in the Academy Schools other drawings. Sculptor candidates must submit a model the round of a figure 2ft. high from t antique, a model in the round of a figu from the life, a drawing of a figure fro the life, and a model of a compositio and as probationers similar works in t schools. Painter and sculptor probatione will have to pass in addition an examin tion in anatomy and perspective. The co ditions of entry for architects have also be revised, an examination in the history art being added. Successful probatione will, as under the old rules, be admitted students for three years, and for a furth period of two years subject to the passing an examination at the end of the first ter In this second examination the new rul make but one change of importance. Th student who wishes to remain at th Academy Schools for a further period of tw years must not only as before show com petent work in painting, drawing an modelling executed in the schools. Th painter must, in addition, make a painte sketch to fill a space of which the measure ments and architectural features will b given, and the sculptor must make a modelle design on similar lines and a sketch com position in the round. Design is to b further encouraged by the establishment c a school of design for the use of student practising composition, and the visitin Academicians are to set subjects, and afte wards examine and criticise the student efforts. The school of design is to be hun with selected examples, as guides to th students, of every school of compositio including portraiture, landscape, mural deco ration and architecture. Another new featur is a class to be established in the school o architecture, in which the students can prac tise the modelling of ornament under th joint direction of architect and sculpto visitors.

The Stratford Cottages. MR. SIDNEY LEE emphatic ally repudiates the recen allegations of vandalism at Stratford-on-Avon. He maintains that "despite all bold assertions to the contrary no rational archæological interests are jeo pardized." So far from destroying "histori Henley Street," the trustees and the Corpora tion, through the aid of Mr. Carnegie, are Mr. Lee declares, doing precisely the oppo site. They are permanently preserving in houses under their control all structural work which has proved on accurate examination to possess any kind of archæological interest. The process, it is observed, of modernizing Henley Street had in past years progressed very far, and of late, but for Mr. Carnegie's interposition, threatened a conspicuous advance. That process has now, however, been arrested, and "some careful and scholarly restoration has been made practicable."

Obituary.

Mr. James Watson, of the firm of Messrs. James Watson & Son, builders and quarry-masters, of Kirriemuir, died recently at the age of ninety-three years. After a partnership with Mr. David Milne, Mr. Watson commenced business as a builder on his own account. For the last twenty-three years his firm has leased East Quarry, Kirriemuir.

Mr. Francis Trimmer Gompertz died recently at Thames View, St. Margaret's, near Twickenham. He was the eldest son of Mr. Solomon Gompertz, and was born in 1831. He early turned his attention to the subject of classical architecture, and received the silver medal of the Royal Academy in 1856, as well as the gold medal of the Royal Academy in 1857, for his work in his designs for new municipal buildings, and was again

accorded in 1859 further first-class honours for his proposals for a cathedral in the mediæval Gothic style and for his proficiency in the same class of work. After his marriage he travelled much, in company with his wife, throughout the by-ways of England and in Southern Europe, and it is in a measure due to these extended travels that his valuable art collection was completed.

Mr. William Drake, of the building firm of Messrs. Cowley & Drake, of Willesden Green, N.W., died recently at the age of forty-nine years. Mr. Drake had been ailing for some months past, and had left his residence at Willesden Green for the sake of his health and was staying at his native place, Yealmpton, in South Devon. The partnership began with works in London and continued after 1880 at Willesden Green. In connection with the firm he had executed numerous important public works, which include the erection of the Court House, Willesden, for the Middlesex County Council; Salisbury Road and Pound Lane Board Schools, and the present erection of the Chamberlayne Wood Road Board School for the Willesden School Board, the Passmore Edwards Cottage Hospital for Willesden, and many others.

ANCIENT LIGHTS.

Text of the Bill.

THE following is the text of the Bill to amend the law relating to easements of light drawn up by the joint committee of the Royal Institute of British Architects and the Surveyors' Institution, and read a first ime in the House of Commons on June 22nd ast :—

Part I.—Preliminary.

1.—(1) This Act may be cited as The Ancient Lights Act, 19 .

(2) This Act shall come into operation on he day of 19 .

This Act does not extend to Scotland or reland.

Part II.—Definitions.

2.—(1) In this Act unless a contrary intention appears :—

(i.) Tenement includes land also any dwelling-house workshop or other building.

(ii.) Window includes any aperture for the purpose of admitting light.

(iii.) Street means and includes any highway road bridge lane mews footway square court alley passage whether a thoroughfare or not and a part of any such highway road bridge lane mews footway square court alley or passage.

(iv.) Owner includes every person in possession or in receipt of the rents and profits of a tenement and having an interest in such tenement not less than as a tenant thereof from year to year.

(v.) Occupier does not include a lodger.

(vi.) The tribunal of appeal means the tribunal of appeal constituted by this Act.

(2) In this Act if two tenements are so tuated that the owner of the first is entitled o a right to light passing over the second he first tenement is called a dominant tenement and the owner thereof a dominant wner and the second tenement is called a ervient tenement and the owner thereof a ervient owner and the first tenement is eferred to as being dominant over the econd and the second tenement as being ervient to the first.

Part III.—Limitation of the Amount of Light of a Dominant Owner.

3.—(1) From and after the commencement f this Act an owner of a dominant tenement shall subject as herein provided be entitled to such amount of light passing over the servient tenement as is reasonably necessary for the comfortable use and enjoyment of the dominant tenement if a dwelling-house or for its beneficial use and occupation if used as a place of business or for any other purpose than a dwelling-house and he shall not be entitled to any extraordinary amount of light necessary for any particular purpose trade or occupation.

(2) Nothing in this section shall confer on the owner of any dominant tenement over the tenement servient thereto any right to a greater amount of light than he would have possessed if this Act had not passed.

(3) This section shall not apply to a tenement in which a trade or occupation requiring an extraordinary amount of light has been continuously carried on for ten years during the continuance of such trade or occupation.

(4) This section applies only when the right of the dominant owner to the light passing over the servient tenement becomes absolute and indefeasible after the commencement of this Act.

Part IV.—Obstruction of Light by Notice in Place of Physical Obstruction.

4.—(1) The owner of a tenement which is not at the time servient to another tenement but over which such other tenement would in course of time become dominant may serve upon the occupier of and upon any other persons whom he knows to be interested in the tenement which would become so dominant a notice (in this Act called an obstruction to light notice).

(2) An obstruction to light notice shall be in writing in the form contained in the first schedule to this Act or as near thereto as circumstances will permit and shall be accompanied by a plan and section or elevation showing the windows the access of light through or to which is to be deemed obstructed.

(3) On and after the day of service of an obstruction to light notice the access of light to the windows mentioned in the obstruction to light notice shall be deemed to be obstructed in like manner as if the same were actually and physically obstructed.

(4) Any person aggrieved by an obstruction to light notice shall be entitled to the like relief so far as may be as he would have been entitled to if the access of light to the windows mentioned in the obstruction to light notice had been actually and physically obstructed by the person serving the notice.

(5) An obstruction to light notice shall subject to any relief which may be granted before the expiration of one year from the day of service thereof by a court of competent jurisdiction be deemed to be and shall have the like effect as an interruption within the meaning of section 3 of the Prescription Act 1832 which has been submitted to or acquiesced in for a year.

(6) On the sale of any tenement it shall be the duty of the vendor to disclose any obstruction to light notice which may have been served in respect of that tenement.

(7) It shall be the duty of any person who may receive an obstruction to light notice under this Act in respect of a tenement which he holds as occupier or lessee for a term of years or for lives to forward or deliver such notice forthwith to his next superior landlord.

Part V.—Right to Light passing over Streets.

5. No title shall be acquired by prescription under the Prescription Act 1832 or at common law or otherwise by the owner of any building which shall have been erected after the 31st day of December 1890 and which abuts on any street to a right to light passing over a tenement on the opposite side of that street.

Part VI.—Provisions for Certificated Plans of Buildings about to be taken down.

6.—(1) The owner of a building which is intended to be taken down and rebuilt may cause plans sections and elevations of such building to be prepared and may make application to the official surveyor for an inspection and survey of such building and for a certificate of the correctness of such plans sections and elevations and such application shall be dealt with as hereinafter provided.

(2) Every such application to the official surveyor shall be accompanied by a payment of the sum payable in accordance with the table of fees contained in the schedule to this Act and such sum shall be his fee for the inspection and survey and for the grant or refusal (as the case may be) of the certificate and it shall not be lawful for the official surveyor to demand or receive any further fee or payment in respect thereof.

(3) The official surveyor shall either grant a certificate that in his opinion the plans sections and elevations are correct or he shall refuse to grant such certificate in which case he shall state the grounds of such refusal and such certificate or refusal shall be in the form set out in the schedule to this Act with such modifications if any as the circumstances may require.

(4) Where the official surveyor refuses to grant a certificate applied for under this Act the applicant may if he think fit cause fresh plans sections and elevations to be prepared having regard to the objections stated in the form of refusal and may thereupon make a further application to the official surveyor to inspect and survey the building.

(5) If the official surveyor on re-inspection and re-survey be of opinion that the fresh plans sections and elevations are correct he shall grant a certificate under this Act with respect thereto.

(6) Where the official surveyor refuses to grant a certificate under this Act it shall be lawful for the applicant at any time within fourteen days after the date of such refusal to make application to the tribunal of appeal by way of appeal against such refusal and such appeal shall be accompanied by a copy of the form of refusal by the official surveyor.

(7) A certificate granted under this Act shall be conclusive evidence of the correctness of such plans sections and elevations in any actions or matter relating to the right of the owner of such building to light.

(8) In this section the official surveyor means in the case of a building situate in the county of London the district surveyor appointed to the district in which such building is situated and in the case of a building situated in any other county but not within a borough the county surveyor and in the case of a building situated in a borough the borough surveyor.

(9) The official surveyor shall keep a register of such drawings and shall thereupon be entitled to demand and receive the further fees set out in the schedule to this Act. Such drawings shall be deposited at the town or county hall and be open to public inspection on payment of a fee as set out in the schedule to this Act.

Part VII.—Statement of Claims arising out of Rights to Light.

7.—(1) Where a servient owner is erecting or intends to erect any new building or alter any existing building on his tenement he shall at the request of the dominant owner give facilities to the dominant owner or any person duly appointed on his behalf to inspect the plans elevations and sections of such intended new building or alteration (if any) and if there be no such plans elevations and sections shall give such information relating to such intended building or alteration to the dominant owner as the dominant owner may reasonably require.

(2) A dominant owner who has made such request as aforesaid may at any time within seven days after inspecting such plans elevations and sections or receiving such information serve upon the servient owner a notice of his objections or the terms on which he is willing to permit the servient owner to erect his building. Such notice shall be in writing and sent by registered post or served personally.

(3) Such notice shall contain particulars of the estate or interest claimed by the dominant owner in the dominant tenement and also the name and address of a surveyor who will act on behalf of the dominant owner in case a difference between him and the servient owner should arise.

(4) If the servient owner shall within seven days after the service on him of such notice serve the dominant owner with notice in writing that he accepts the terms of such notice there shall be deemed to be an agreement between the dominant owner and the servient owner that the servient owner will fulfil the requirements of such notice.

(5) If the servient owner is not willing to accept the terms of such notice he shall within seven days after the service on him of such notice serve notice in writing that he refuses the terms of such notice and shall state the name of a surveyor who will act on his behalf.

(6) In this section the expressions dominant owner and servient owner include respectively persons claiming to be such respectively.

8.—(*a*) Unless the servient owner shall have accepted the terms of the notice the two surveyors so appointed shall within ten days of the appointment of the last of them meet together and endeavour to determine the questions in dispute arising out of the said notice and shall before entering upon such questions appoint by writing under their hands an umpire to whom the matter shall be referred in case such arbitrators fail to agree.

(*b*) The umpire shall be a member of the Royal Institute of British Architects or of the Surveyors' Institution.

(*c*) The umpire shall view the site and the dominant and servient tenement and make his award within twenty-one days after the original time appointed by this Act for making the award by the arbitrators has expired.

9. The arbitrators or their umpire may by their award decide any of the following matters namely:—

(*a*) The right of the owner of the tenement who proposed to build to carry out his intended works.

(*b*) The alteration if any necessary to be made in carrying out the intended new buildings or alterations so as to prevent or lessen obstruction to the lights of the tenements as set out in the notice of objection.

(*c*) The amount if any of compensation of every description to be made to the owner lessee or occupier.

(*d*) The alterations if any to the adjoining premises by light reflecting surfaces enlargement of lights heightening of premises or other means.

(*e*) The amount of costs to be paid by either party.

(*f*) Any other matter necessary to enable the difference between dominant and servient owners to be determined.

10. In the event of either party neglecting to appoint a surveyor within the prescribed period or of the unwillingness of the umpire appointed to act and no other umpire being agreed upon within a period of ten days from his refusal to act either party may apply to the president for the time being of the Royal Institute of British Architects or the president for the time being of the Surveyors' Institution who shall forthwith appoint an umpire.

Appeal from Surveyors to Tribunal of Appeal.

11. Any award given by such arbitrators or their umpire shall be conclusive and shall not be questioned in any court with this exception namely that either of the parties to the difference may appeal therefrom to the tribunal of appeal within fourteen days from the date of the delivery of the award and the tribunal of appeal may subject as hereafter in this section mentioned rescind the award or modify it in such manner as it thinks just.

Reference of Dispute to High Court.

12. If the appellant from any such award where the amount awarded exceeds £500 in money damages or cost of works or where the interference with the proposed works exceeds £500 refuses to accept the decision of the tribunal of appeal and gives security to be approved by the members of that tribunal to prosecute his appeal within one month from the publication of such decision and to abide the event thereof all proceedings in the tribunal of appeal shall thereupon be stayed and the appellant may bring an action in the High Court against the other party to the difference.

Settlement of an Issue to determine Dispute.

13. The plaintiff in such action shall deliver to the defendant an issue without pleadings whereby the matters in difference between them may be tried and the form of such issue in case of dispute or in case of the non-appearance of the defendant shall be settled by the High Court and such action shall be prosecuted and issue tried in the same manner and subject to the same incidents in and subject to which actions are prosecuted and issues tried in the Commercial Court of the High Court or as near thereto as circumstances admit.

Special Case.

14. If the parties to any such action agree as to the facts a special case may be stated for the opinion of the High Court and any case so stated may be brought before the Court in like manner and subject to the same incidence in and subject to which other special cases are brought before such Court or as near thereto as circumstances admit and any costs that may have been incurred in the tribunal of appeal by the parties to such action as is mentioned in this section shall be deemed to be costs incurred in such action and be payable accordingly.

Part VIII.—Constitution of Tribunal of Appeal.

15. For the purposes of this Act a tribunal of appeal shall be constituted as follows:—

Three members shall be barristers-at-law and shall be appointed by a Secretary of State.

Three members shall be appointed by the Council of the Royal Institute of British Architects.

Three members shall be appointed by the Council of the Surveyors' Institution.

Duration of Office.

16. A member of the tribunal of appeal shall be appointed for a term of one year and at the expiration of his term of office shall be eligible for reappointment.

Removal of Members.

17. The Lord Chancellor may remove for inability or misbehaviour any member of the tribunal of appeal.

The tribunal of appeal may act notwithstanding any vacancy in their body but not less than three members of whom one shall be a barrister-at-law shall attend at the hearing of any case.

18. The tribunal of appeal may hold sittings in any part of England in such place or places as may be most convenient for the determination of proceedings before them.

Vacancies to be supplied.

19. Upon the occurrence of any vacancy in the tribunal of appeal or during the temporary absence through illness or other unavoidable cause of any member thereof a Secretary of State the Council of the Royal Institute of British Architects or the Council of the Surveyors' Institution (as the may be) whichever of them shall have appointed the member of the tribunal whose place shall be vacated shall appoint forthwith a fit person to be a member (either temporary or permanent) of the tribunal in place of the member whose place is vacated or who is temporarily absent as aforesaid.

Remuneration of Members of Tribunal.

20. There shall be paid to each member of the tribunal of appeal such fees as a Secretary of State shall with the concurrence of the Treasury determine.

Officers, &c., of Tribunal.

21. It shall be lawful for the tribunal of appeal to appoint such clerks officers and servants as they may find necessary who shall be paid such salaries as shall be determined by a Secretary of State with the concurrence of the Treasury and to provide offices.

22. The members forming for the purposes of each case the tribunal of appeal shall personally visit the tenements both of the appellants and the respondents.

Jurisdiction of Tribunal.

23. The tribunal of appeal shall subject to the provisions of this Act have jurisdiction and power to hear and determine appeals referred to them under this Act and shall have power to determine whether and if so to what extent the proposed new buildings should be amended or the dominant premises altered.

24. For all the purposes of and incidental to the hearing and determination of any appeal the tribunal shall (subject to any rules of procedure duly made) have power to hear the parties interested either in person or by counsel as they may think fit and to administer oaths and to hear and receive evidence and require the production of any documents or books and to confirm or reverse or vary any decision and make any such order as they may think fit and the costs of any of the parties to the appeal shall be in the discretion of the tribunal of appeal.

Regulations as to Procedure and Fees.

25. The tribunal of appeal may from time to time subject to the approval of the Lord Chancellor make regulations consistent with the provisions of this Act as to the procedure to be followed in cases of appeal to the tribunal of appeal including the time and notice of appeal and as to fees to be paid by appellants and other parties.

Enforcement of Decision of Tribunal.

26. Any order of the tribunal of appeal may be enforced by the High Court as if it had been an order of that court.

27. In any action by a dominant owner against a servient owner in which an injunction is claimed notwithstanding that an injunction may by an interlocutory order have been already granted upon the application by motion of the servient owner either party may apply to a judge of the High Court either to hear such action with assessors or to refer the matter to arbitration in accordance with the provisions hereinbefore contained. If on the hearing of such application the judge shall be of opinion that the claim may be reasonably satisfied by damages he may on his own motion refer the case to arbitration and if on such hearing he shall be of opinion that the action for an injunction has been unreasonably or unnecessarily commenced he may order the party bringing such action to pay the costs of the defendant on such scale as he may deem fit.

The Editors of The Builders' Journal, in response to many repeated requests by students and others, have compiled the following list of the most suitable books published on the various subjects which appertain to architecture and the building trades. Special arrangements have been made to enable readers to be supplied with books at the published prices, *post free.* An endeavour will be made to obtain for regular readers and subscribers any other Technical Books not in this or succeeding lists, and these will also be forwarded to them post free. The names given in brackets are those of the authors or editors of the respective books.

The Builders' Journal List of Technical Books.

Remittances for the amounts stated below should be sent by postal orders, addressed to The Publisher, Technical Journals, Ltd., 6, Great New Street, London, E.C.

No. I LIST.

THE LONDON
OF OUR
FORE-FATHERS

is rapidly disappearing, and many picturesque bits of Old London have already been demolished to make room for modern requirements.

The following Photogravures (reproduced by the Rembrandt Process), from originals by Mr. F. L. Emanuel, form a lasting record of many of these interesting buildings.

No further copies can be published, as the plates have been destroyed, and the pictures are therefore quite unique.

Single Copies at the following Prices:—

1. **The "Old Horse and Groom,"** Back of Holborn-above-Bar (since demolished).	6d. each.
2. **Holywell Street,** from St. Clement Dane's Church (since demolished).	2s. 6d. each.
3. **The "Old Bell,"** Holborn (since demolished).	1s. 6d. each.
4. **Leather Lane,** Holborn.	1s. 0d. each.
5. **Davies Street** (since demolished).	9d. each.
6. **Fetter Lane,** View from Holborn.	6d. each.
7. **King Street,** Westminster (since demolished).	1s. 6d. each.
8. **Staple Inn,** Holborn.	2s. 6d. each.
9. **Milford Lane,** Strand, and Booksellers' Row, looking West (since demolished).	6d. each.
10. **Lincoln's Inn Fields.**	1s. 6d. each.
11. **Archway,** Portugal Street, Lincoln's Inn Fields.	9d. each.
12. **Old Houses in Strand.**	6d. each.
13. **Exchange Court,** Strand.	6d. each.

Trade and Craft.

A New Machine for Shaping Bricks.

Mr. William Caplen, of 29, Tamworth Road, West Croydon, announces that having made arrangements with an eminent firm of engineers to manufacture his patent machine for shaping bricks for gauge or moulded brickwork, he is now in a position to execute orders for the same. The machine has been tested by a large number of persons engaged in the building trade, and has proved to be a great time- and labour-saving invention, besides being a considerable improvement on the old method of moulding or shaping bricks. By its use gauged or moulded brickwork can be formed into any predetermined and desired shape with absolute precision, and four time quicker than by the old method. The machine has nothing unnecessary about it, and is not liable to get out of repair. It effects a considerable saving of material and dispenses with the various implements formally used for the same purpose, such as the bevel, templet, square, bowsaw, specially-prepared moulds, and other similar tools. The bench of the machine can be used for any ordinary sawing purposes. This machine turns out extremely clean work with remarkable rapidity, as a rule far better than the old hand methods of working.

Artistic Mantels.

Messrs. Barnard, Bishop & Barnards, Ltd., of Norwich (London showrooms at 23, Princes Street, Cavendish Square, W.), have issued a new catalogue containing a few selected designs of their artistic grates and mantels. These include the "Norvic," the "Saxon," the "York," the "Lancaster," the "Howard," the "Warwick," and a new mantel register in iron, No. 901. The "Norvic" is a tasteful design consisting of a hand-carved oak mantel with an overmantel having a square mirror in the centre and fluted pilasters running down at either side of the grate, the latter being carried out in briquette tiles with bull-nosed edges next the fire, slabbed up in one solid piece on the firm's lock-fast principle. When made up, the fire lasts eight or ten hours without attention, and if desired the pan can be removed to allow a genuine log, peat or coal fire to burn on the hearth without the smoke coming into the room or the heat being wasted up the chimney. The cost of the grate is about £6 10s., or £22 with the oak mantel and overmantel. The "Saxon" is made up entirely of tiles with solid glazed hobs, in one piece ready for fixing. The arrangement of the fire basket is good, but the design itself is not so commendable, the centre panel and bulges over the columns being undesirable. The "York" and "Lancaster" are excellent designs, perfectly simple in treatment. They each consist of a mantel register made up entirely of tiles, bull-nosed at the edges, with a shelf which can be made in pine for painting or in oak fumigated, mahogany or walnut dull-polished. The head of the fire opening is square in the "Lancaster," which is rather more effective than the cambered head of the "York." These mantels range in price from £5 15s. to £7 10s. The "Howard" is a similar grate to the "Norvic" but with a cambered head instead of a tiled hood, and with a different mantel and overmantel. The "Warwick" is a quaint design. It has a hand-repoussé canopy over the grate, the latter being fitted on an iron base with asbestos packing, Teale fire-basket, ashpan with ventilating front and register door. The overmantel has a cupboard at each side. Altogether the designs are to be recommended, and architects will doubtless be glad to adopt them in place of the mid-Victorian monstrosities in cast-iron which even now find a considerable market.

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, 9, *East Harding Street, E.C.*

Ayr.—For the work to be done in laying sewers and constructing sewage purification works in the special drainage district of Craigbank, New Cumnock, for the Ayr District Committee. Mr. W. R. Copland, C.E., engineer, 146. West Regent Street, Glasgow:—

INSTITUTE OF SANITARY ENGINEERS, LTD.—Provincial Summer Meeting at Wolverhampton (three days).

Wednesday, July 15.

ROYAL INSTITUTE OF PUBLIC HEALTH.—Congress at University College, Liverpool (six days).

The Hellenic Society held its annual meeting last week in the rooms of the Society of Antiquaries. The report of the council stated that a further grant of £100 had been made to the Cretan Exploration Fund, that the annual grant of £100 to the British School at Athens had been renewed for a further period of three years, and that the Society made a small grant to the British School at Rome; a grant of £25 had also been made to Mr. D. G. Hogarth to assist him in exploring Greek sites in the northern portion of the Egyptian delta. Of losses sustained by death during the past year, special mention was due to Mr. F. C. Penrose, the eminent architect, who had served on the council since the foundation of the society, and had for many years held the office of vice-president, and to Mr. Stephen Spring Rice, C.B., one of the auditors of the society. The present total of subscribing members is 816, and of honorary members twenty-five.

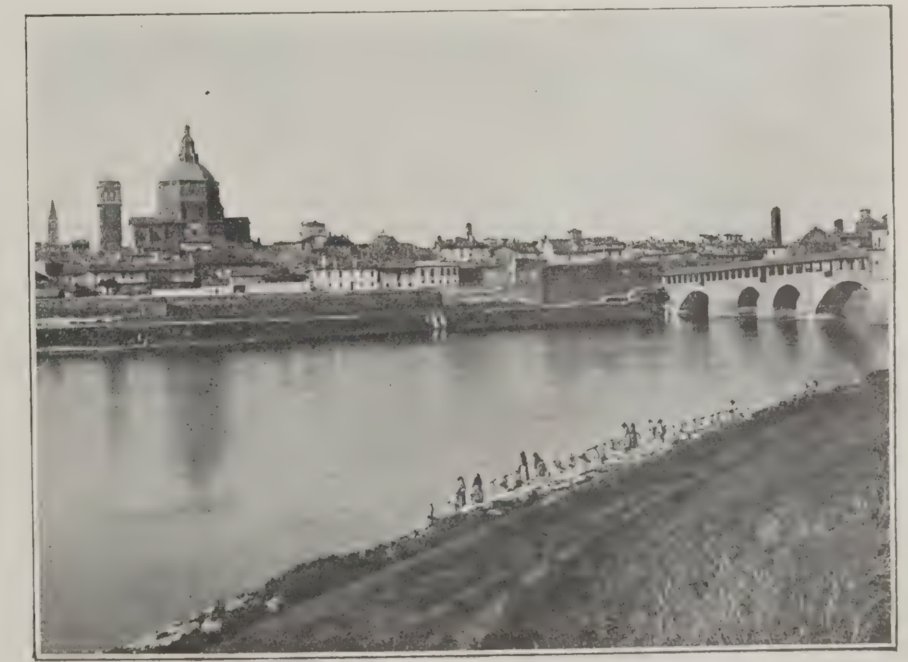
The Roof of Pavia Bridge.

The Borgo Ticino, a suburb of Pavia in Northern Italy, is connected with the city by means of a covered bridge over the Ticino river. This bridge, which dates from the year 1354, is 708ft. long, 16ft. wide, and was erected by Duke Galeazzo Visconti II., the design of the bridge being attributed to Giovanni di Ferrara and Jacopo da Gozzo. The bridge, which consists of seven arches, is shown in a cartoon for tapestry representing the battle of Pavia (at which the French king, Francis I., was taken prisoner by the Emperor Charles V.), formerly the property of the Marquis del Vasto, but now in the National Museum at Naples, in which the openings at the sides of the bridge are filled in with brickwork with windows in the same. The roof, which is of wood, is supported by upwards of one hundred granite columns; these greatly contribute to the stability of the bridge, which has successfully resisted for very nearly 550 years the floods to which the river is liable. In the centre of the bridge is a small chapel dedicated to St. Giovanni Nepomucene, the walls of which are covered with votive offerings representing cases of rescue from drowning, which were ascribed to the intervention of the saint. On the pretext that the covered bridge is insanitary, it is proposed to remove the roof in order to admit light and air, but it is satisfactory to note that the proposal has met with opposition from some of the more enlightened inhabitants of the city. It is pointed out that neither the Venetians nor the Florentines have considered it necessary to remove the shops which encumber the Rialto at Venice and the Ponte Vecchio at Florence, and it is to be surmised that the citizens of these places are as fully alive to the necessities of the case as the inhabitants of Pavia. What would be said, it is asked, if the Romans of the Via Palombella, in order to admit light and air to that quarter of the city, proposed to remove the Pantheon, or the people of Lucca determined to destroy their fortifications? The bridge over the Ticino does not appear to have been scheduled as a national monument, an omission which renders it liable to attacks by the municipality of the city, such bodies being usually in Italy, as elsewhere, more ready to destroy than to preserve relics of antiquity. There is a photograph of the bridge in the III-IV part of Memorie e Documenti per la Storia di Pavia, edited by Signor Moiraghi, April, 1895; and there is a measured drawing of it by Signor Giovanni Voghera in *Antichità Pavesi, part ii., 1825;* both of which works are in the library of the British Museum.

Art in Towns.

There has been a noticeable increase in the regard of the public for art in their surroundings during the last few years, and last week a number of circumstances combined to bring this out strongly. Our public bodies are beginning to appreciate the importance of art to the well-being of the community. This question was touched upon by Mr. John Slater, F.R.I.B.A., at the Sanitary Institute Congress, as reported on p. 329 of this issue. Mr. Richardson Evans, hon. secretary of the Society for Checking the Abuses of Public Advertising, in a letter to the "Times," in calling upon the authorities to secure powers to control advertising in public places and to protect the picturesque, mentions by way of example and encouragement that the Prussian Parliament has just passed an Act whereby local authorities are empowered to forbid not only any form of conspicuous announcement that impairs a landscape, but any lettering or placards on private premises, whether they relate to the business conducted there or not. The Massachusetts State Legislature has also passed a similar Act. The London County Council has already taken the lead in prohibiting sky-signs. A meeting was held last week convened by Mr. Mark H. Judge, A.R.I.B.A., to promote the revision recently suggested by Mr. Hamo Thornycroft of the planning of the new Strand as laid out by the London County Council. Sir Henry Lawrence was in the chair, and letters in support were received from Sir Edward J. Poynter, P.R.A.; Mr. T. G. Jackson, R.A.; Mr. Lionel Cust, Director of the National Portrait Gallery; Sir Henry Truman Wood; Sir William Chance, Bart.; the Lord Chief Justice; Major-General Shaw-Stewart, Mr. Halsey Ricardo, Mr. W. Gwyther, F.R.I.B.A., Mr. C. F. A. Voysey, Prof. W. H. Hudson and many others. The Council have postponed the auction sale of building land in Aldwych and the new Strand until October 13th next, and this gives hope the much-needed alteration will be made. The L.C.C. expects the western end of Aldwych to be completed before the new Gaiety Theatre is opened two or three months hence.



THE OLD COVERED BRIDGE AT PAVIA.

THE SHANNON FACTORY.

THE Shannon Factory, which is being erected for the Shannon Co., Ltd., at Dalston, will be a model cabinet-making factory. It is to be opened in the early autumn, and is already practically complete. It has been designed and executed under the personal supervision of Mr. Edwin O. Sachs, who was assisted by his manager, Mr. Lister, and latterly by his partner, Mr. S. Hoffman; Mr. Kissack acting as clerk of works, and the general contractors were Messrs. Howard & Co., of Bow Street, Covent Garden.

It is being equipped under the personal direction of the managing director, Mr. Schafer, in consultation with Mr. Sachs. It embodies everything that is new in the best American and Continental practice, including a full equipment of modern American tools and machines, and much English plant on American models.

The purpose of the factory is the execution of first-class cabinet work and the finer forms of joinery, as well as the general cabinet-making of the roll-top desk and other office utensils with which the name of the Shannon Co., Ltd., has been so successfully associated, but in respect to which architects have certain prejudices on account of the American mouldings, which do not appeal to English taste, and which will now be almost done away with to make room for English work and designs.

The property taken by Messrs. The Shannon, Ltd., for their new factory and warehouse is at Dalston, close to Dalston Lane Station, and is cut in two by a small street called Tyssen Street. The larger half of the site is now the scene of the present building operations, and this site measures 220ft. by 140ft., and is almost rectangular in shape. Light is obtained in the aforesaid Tyssen Street on one side, from Tyssen Passage on the other, and as the land abuts on the Great Northern Railway, light is also obtainable from a third side.

The basis of the plan was the formation of a large central block with two wings projecting, thus forming a semi-enclosed central court. Facing this court, but at the opposite end of the site, were to be placed the boiler-house, dry kilns, and other minor adjuncts of the concern.

The main block has a basement 10ft. high, a ground floor 20ft. high, a first floor 20ft. high, a second floor 10ft. high, and a third top-lighted floor. The west wing and east wing both have the same high ground floor, but the first floor is divided into floors of 10ft. high each, and thus a series of 10ft. floors are provided for.

The different blocks are separated by strong party walls, and the various double iron doors required under the Building Act Further, all the many provisions of the Factory Act have been most carefully acceded to, and in staircase accommodation, exit doors and emergency exits generally, there are few factories that can compare with this structure in the United Kingdom. The central block is particularly remarkable for the fact that it is just within the maximum limits of cubical contents that can be accorded in the County of London, and is hence, perhaps, the largest individual factory block in the Metropolis. The Columbian Fireproof Flooring Company have had the construction of the floors, Wenham & Waters supplied the casements, the Crittall Manufacturing Company the iron doors, and the Patent Impervious Stone Company the stone steps and general stonework. Fire-resisting floors have not only been used throughout, but the big columns, girders, &c., have been protected by 2in. of concrete; and again, besides the constructional preventative measures, the entire blocks are being fitted with a sprinkler system.

Intercommunication between the different floors is by means of lifts, wells, cranes, as well as by the staircases. Conveniences for the staff are on every floor, and the west wing basement is devoted entirely to mess-rooms and dressing-rooms for the employeés.

The actual division of the building into various workshops is not a matter that should be described at the moment, but it might be said that everything has been done to save unnecessary moving of material and to economise in labour. Runaways, trolley lines, &c., have amply been made use of.

Of the buildings facing the main structure, the boiler-house, with its chimney 80ft. high, is the most important, containing not only boilers, but also dynamo rooms, &c., for creating the necessary power plant, the whole of the installation being worked by electricity.

Dust-removal contrivances, ventilation and heating apparatus are all on modern lines, worked from this central boiler-house.

The site that has been left vacant on the other side of Tyssen Street for the moment is the future location of a large warehouse for the Company, which Mr. Sachs has so contrived as to materially assist the general ensemble of the group, particularly if permission can be obtained from the local authorities to arch over Tyssen Street.

As to the exterior architectural treatment, an attempt has been made to follow the example of Mr. Aston Webb, inasmuch as Mr. Sachs has given the factory an architectural treatment and not erected the usual factory monstrosity generally associated with our industrial work.

The factory is one that merits the attention of architects, both in respect to construction, equipment and design, but it further merits their attention in respect to the modern methods of wood-working practised in the factory, which should be of general interest to all connected with the building trades, as it embodies everything that is modern in the handling of wood, the fitting together of joinery and the practice of cabinet-making.

THE FIRE PREVENTION CONGRESS.

(Continued from p. 316, No. 439.)

THE International Fire Prevention Congress, convened by the British Fire Prevention Committee, resumed its meetings on Tuesday, July 7th, at Caxton Hall, Westminster. Mr. Edwin O. Sachs presided, and there was a large attendance of delegates and representatives from the provinces, the colonies and foreign countries.

A paper on "The Prevention of Loss by Fire in the United States of America," compiled by Dr. Edward Atkinson (president of the Boston Manufacturers' Mutual Fire Insurance Company), was read by Mr. J. P. Gray (delegate of the Boston Manufacturing Mutual Insurance Company). The following is a summary:—

The problem presented to the underwriters of the United States and to the community as a whole, is totally different from any problem that could be found in any European country, especially in Great Britain. First, the climate or climates of the United States vary from those of Europe in matters that have an important bearing upon the construction of buildings. Within the great section which extends from the Atlantic to the Pacific, between parallels of latitude 35 degs. to 45 degs. N., where are found the larger part of the population, the greater number of factories and workshops, the principal cities and public buildings, and by far the greater number of the public school buildings, there are very great variations between summer and winter, the common range of the thermometer being from 30 below zero Fahr. (−34 degs. C.)—sometimes lower—to 90 Fahr. (+32 degs. C.), and sometimes higher. There is also a great variation in the constant of humidity.

The next variation from European conditions is to be found in the huge abundance of timber, both resinous and hard wood, and the relative scarcity of good building stone in the earlier period of the history of the country. As yet no building stone has been discovered corresponding to the stone which is so much used in France and Belgium, which can be cut and carved like cheese, but hardens like iron on exposure to the atmosphere for a short period. It therefore happened that the best material for the construction of dwelling-houses in the early stages of the growth of towns and cities and throughout the country districts is wood, disposed in a suitable manner and properly finished within and without, rather than brick or stone. It is also true that when these latter materials are used in the ordinary way, that is, without excess of cost in building thick walls with air spaces in the walls to prevent ill-effects of cold, heat and dampness, they are alternately affected by heat, cold and dampness in excess, from which properly-constructed wooden buildings are free. In the extreme cold of winter brick and stone walls become chilled, presently gathering humidity from the atmosphere within the dwelling or building, making the house very damp and difficult to heat; whereas, in the hot summer, brick walls heat very rapidly and become intolerable unless expensively constructed with air spaces. On the other hand, wood is well known to be among the best of the non-heat-conducting mediums, and when disposed in thick sections of heavy mass the building of wood or timber, with properly-constructed roof, is warmer in winter, cooler in summer, more easily heated and ventilated, and in every way a more sanitary building than any other kind yet devised except at very heavy relative cost.

The change which has been brought about in factory construction, under the influence of the Factory Mutual Underwriters, has not been in giving up the use of wood or in any effort to construct fireproof mills or workshops; but in reverting, one may say, to the heavy timber construction of the Colonial period and the disposal of plank and timber within brick or stone walls in such a way that there may be no concealed spaces through which fire may pass out of reach of water. In that way and by evolving suitable safeguards and means of protection, the whole system of constructing the textile factories, paper mills and workshops has been rendered safe and suitable.

It would have been a misfortune had the people of the United States adopted more durable methods by constructing city buildings, factories and workshops of a more permanent kind than they did construct; such buildings would have been, of course, at a much heavier cost, they would have become an encumbrance upon the land, and yet of such solid construction that they might have been incapable of being converted to the right use of modern mechanism. It is only about thirty years ago that a most skilful and competent mill engineer, under whose supervision some of the largest textile factories had been constructed, made the remark that it was not judicious to plan any factory building for a duration of more than twenty-five years except as to the foundations. Had he made that remark a few years later he would not have excepted the foundations. The textile factory and many other industrial buildings constructed fifty years ago were not over 50ft., often less, in width, and some of them were eight or nine storeys high. The next type was a factory or workshop 60ft. in width, five to six storeys high. Neither type of building is fit for modern conditions, and no person could run modern machinery with any profit whatever in the old type of narrow and high factory building. The modern textile factory is seldom more than three storeys in height for carding and spinning, one storey for weaving. Wherever there is room machine shops are built of one storey, and many other industrial buildings are now being constructed in a similar way. The diffusion of light by ribbed or prismatic glass assures an even daylight over very wide areas, with freedom from glare near the windows.

These rules and methods of slow-burning or mill construction and for the diffusion of light are now being established throughout the United States beyond the area of the influence of the Factory Mutual Fire Insurance Companies, by the distribution of documents from the Insurance Engineering Experiment Station now beginning its work under the direction of the writer.

We may now take up the growth and construction of towns and cities. In that, again, a rapid construction of wooden buildings for temporary use has been and still is necessary for the housing of the population. The first buildings, hastily constructed of wood, soon give place to a better class, and, if the town grows, a wider area may be covered with wooden buildings detached from but very close to each other, the only conspicuous building of a durable kind being the public common schoolhouse, for the construction of which reservations have been made from the public land. Presently the detached wooden buildings give place to brick blocks of a more permanent character, and yet not suitable for any very long duration. In the older cities of the East, narrow streets may be bordered by alternating very old wooden buildings and modern structures, safe or unsafe, as the case may be. Hence comes the necessity for very completely organized and efficient fire departments, and yet occasional conflagrations occur. These conflagrations were not unmitigated evils. They were disastrous to individuals and to part of the insurance companies, but they cleared away a great ruck of unsafe and unsuitable buildings, made the way for re-adjusting lines of streets, and both in the end worked improvement in the cities at the cost of the individuals who suffered.

It thus happens that what may be called unsafe methods of construction have been both necessary and expedient in the progress of the development of the country, and that more permanent buildings which would have absorbed a much greater part of the small capital available would have been an encumbrance rather than a benefit. The methods of construction of the country have therefore adapted themselves to the materials, to variations in climate and to conditions of growth.

The safeguards which are now being introduced, notably the automatic sprinkling system, might, in the judgment of the writer, abate more than one-half of the annual loss by fire. The larger part of losses are in the large workshops, factories, warehouses and shops for the distribution of goods. They occur in a relatively small number of fires, each of large proportion. They occur in by far the large majority of cases in buildings which, although not good models, are capable of being well protected by automatic sprinklers, by standpipes and hydrants at vantage points and upon the roofs, so adjusted as to be worked by the public fire department, and by care in occupancy.

The invention of the self-sustaining steel frame building, developed in the construction of what are known as skyscrapers, has brought an entirely new problem before the underwriters as well as the engineers. In the first instance, it was assumed that because a building was made of incombustible material it might be considered indestructible by fire, with very slight protection to the metal from heat. The Factory Mutual Underwriters distrusted this theory, and have, with rare exception, kept unprotected steel beams from being used to support plank floors, and have in recent years caused cast-iron posts, formerly used in the support of factories, to be disused, the preference being given to squared wooden posts.

With the increasing cost of timber and possible scarcity of large logs, it became expedient for the representatives of the Mutual Underwriters to be prepared for so-called fireproof construction. To that end the Insurance Engineering Experiment Station has been established, under the charge of Prof. Charles L. Norton, and under the general direction of the writer, for testing both by fire, by laboratory experiments, and by lapse of time all the different methods of so-called fireproof construction and all the fire-resistant and fire-retardant materials for inside finish.

The experience of the underwriters who insure the steel-framed buildings has not justified the great confidence with which the work was undertaken. Very destructive fires have occurred in buildings of this type which have been filled with combustible contents. Several of the methods of protecting steel from heat have failed, and while the building has stood well, and has, I believe, in all instances been capable of repair, there has been much damage by heat, especially in the upper stories. It has proved that the prevention of loss by automatic sprinklers is as necessary in an incombustible building as it is in any other. A large portion of the biggest department stores are now being equipped. Other fires in incombustible buildings, causing very little damage, have generated so much suffocating smoke as to make them hazardous and to lead toward the danger of a panic.

But beyond this question of fire hazard is the yet more important problem of corrosion, a factor which at the beginning attracted little or no attention. It unfortunately happens that the type of steel used in the construction of buildings is more subject to rapid corrosion than any other type of metal derived from iron ore. Whether or not the skyscrapers will be safe for any considerable period of time, say for a generation, is now an open question. How to protect steel is being made the subject of the most exhaustive investigation, and will be one of the most important subjects dealt with in the Insurance Engineering Experiment Station.

A short discussion followed, after which the members separated to attend the various sectional meetings.

In Section I., "Building Construction and Equipment," over which Privy Councillor J. Stubben (Cologne) presided, the first paper was read by Mr. Arthur Pordage, Firemaster of Edinburgh, entitled "Building Construction from a Fire Brigade Officer's Point of View," of which the following is a summary:—

My experience in combating fire leads me to the conclusion that what is intended as a safeguard too often becomes a danger, and what is theoretically meant for strength is found in the hour of need a source of weakness. The question of the general arrangement or architectural planning of buildings does not enter into my argument; what I propose to deal with is the type of building usually described as being constructed entirely "fireproof," and to offer from my practical everyday experience suggestions which may perhaps induce building constructors to reconsider certain accepted theories in connection with so-called "fireproof" materials.

From the fireman's point of view these "fireproof" buildings have an element of danger added because of their construction, both in the way of increased risk to the fire brigade and the destruction of property.

My decided opinion is that the materials which meet the requirements are those which are not subject to the laws of expansion and contraction when suddenly exposed to the effects of heat. What are such materials? If we may take for our guidance the results of the tests of time we find them principally in timber, bricks, mortar and good plaster.

Floors and Ceilings.

It is the common experience of every fireman that an ordinary wood floor with a thin plaster ceiling underneath has stood the effects of a fire for probably an hour, and though burned through in places still remained in position and with sufficient stability left in the joisting to admit of the fireman passing over it in the course of his operations in extinguishing the fire. If such a floor survives the effects of fire with its slender remains still in position, how much better would a well-constructed wood floor resist the effects of fire under similar conditions. No extraordinary precautions are necessary to construct such a floor, but I suggest that the ends of the joists should be well bedded in the walls, flooring boards of not less than 1in. thick be well tongued together, the spaces between the joisting be filled with pugging or other deafening, and the underside or ceiling coated with 1in. of good plaster on wire laths. Such a floor will resist a fire either from the top or underside sufficiently long to enable any ordinary fire brigade plenty of time to complete their toilet before turning out and arrive in time to do some good work and prevent the floors from collapsing. Where supports are required, owing to the large superficial area of floor space, built timber supports or columns have been known to remain in position and to serve the purpose a second time after having resisted the effects of a severe fire. If these wood posts or columns are wire lathed and coated with good plaster and treated in a manner similar to that often adopted with iron columns they would come out practically unscathed. It will perhaps be argued that this method by no means gets rid of the difficulty with large spans, where iron must of necessity be introduced, but in such cases wrought-iron columns and girders (well protected) should be used to carry wood flooring and joisting, which latter, being impervious to the effects of heat and cold, remain in position, whereas the concrete floor falls in sections and often wrecks the lower floors which would otherwise not have been affected by the fire. I have known it to be argued that the burning of a wood floor gives off so much smoke that the inmates of a building would be suffocated before being reached. To properly understand this point it is necessary to compare the results of fire on both classes of flooring. We must remember that a partly burnt but intact wood floor always affords a means of reaching the inmates, and that before the floor surface commences to burn the fire must have been very severe and the contents of the apartment would almost certainly have been involved. It frequently happens that the flooring in "fireproof" buildings begins to break away at the early stages of a fire, preventing the fireman entering to attack it, with the result that the operations must necessarily be conducted from the outside, thus giving the fire a chance to make some headway. On the other hand, when the water can be got on to the wood floor and supports, there is the possibility of keeping the floor intact.

Partitions.

The reliability of partitions between the different sections and rooms of a building, whether dwelling-house or warehouse, to resist fire, is of the utmost importance, and often determines the fate of the building. The progress of a fire is often regulated by the area of the compartment in which it originates and the internal partitions; therefore much depends upon the time during which the latter remains intact. The wooden lath and plaster partition may be immediately thrown out of court, the light laths with rough edges and the space between being a ready conductor of fire from one part of the building to the other. Internal partitions should be solid, preferably of brick, and continued up right through the building, the joisting at the different floors running through them, so that they practically form an internal wall from the basement to the roof. The advantages of such a partition would be many, apart from being a factor in fire prevention.

Stairs.

Great stress is laid upon the idea of employing stone for staircases as a safe and reliable exit for a large number of persons from a building on fire. This is a very good principle under certain conditions, and these are that a stone stair should be built in a well, apart from the general building and in such a manner that fire or heat cannot possibly get at the underside of the stair. Where a staircase must necessarily run through a building, stone or concrete should be avoided in its construction, but good solid wood (hardwood by preference) is the most reliable under all circumstances. If the underside of the treads be filled in with "deafening" and coated with good plaster, such a stair will remain in position during the progress of a fire long after it has been impossible for any human being to traverse it. If the stair should actually get alight, and the fire fed by an open door should even cause it to burn fiercely, so soon as the hose is applied by the fire brigade the fire will be almost immediately extinguished because the actual burning is only superficial, and there will remain sufficient substance to admit of persons passing over the stair.

It may be argued that a stone stair would not take fire at all, and therefore would always remain passable, but every fireman knows that when there is sufficient heat and flame to ignite the wooden structure of a hardwood staircase it is quite impossible for anyone to pass either up or down a stone stair under similar circumstances.

In my preference for wood in the construction of stairs I specially exclude light and flimsy wooden flights of stairs which are so very frequently found in some dwelling-houses, warehouses, &c., and the wooden step ladder almost invariably found in factories. I speak of a well-built staircase with hardwood treads and facings, the underside filled in with deafening and coated with plaster.

Stone, as employed in stairs in ordinary buildings, cannot in any sense of the word be considered to be "fireproof," because it succumbs to the effects of heat and fire more readily than any other material employed in the construction of buildings. That portion of the stone tread which is exposed to the fire readily expands under its influence, whilst the ends, which are embedded in the wall, remain normal, the natural consequence being a fracture near the wall, and the collapse of the projecting portion.

It has been equally demonstrated that iron, and especially cast-iron, is utterly unreliable under the influences of fire; whilst wrought iron will buckle and twist itself out of position, cast iron will collapse entirely.

Roofs.

The matter of the general arrangement of roofs deserves to receive more serious attention than is usually given to this most important part of the modern building. Unfortunately a fire-preventive roof does not appeal to the artistic eye, especially in large modern country houses, where the old English style of architecture with its long sloping gables has found so much favour of recent years. These high roofs admit of the fire running all over the building, and their construction prevents a fire being attacked from the outside until a hole has been burned through the roof. In all buildings where fire prevention is aimed at, the division walls should be carried at least 3ft. or 4ft. through the roof, with a ledging of at least 24in. round the edge, which would admit of men working upon it in case of fire. Such a ledging affords a ready means of both saving life and attacking a fire. The roof is one portion of a building where iron may be used with advantage by reason of the light weight which it has to support and the necessarily exposed condition of its construction. A lightly constructed trussed iron roof reduces the risk of a fire originating and spreading in the roof to a minimum.

To prevent possible misunderstanding I desire to say, in conclusion, that while advocating the more general employment of timber in buildings, I do not include in this category the light pine and deal stairways, thin wooden doors and matchboard lining partitions, but the employment of substantial timber well protected where possible and of course the avoidance of all exposed edges.

Privy Councillor Stubben then read a paper in German on urban fire protection as influenced by street planning and building regulations.

Fireproofing Existing Buildings.

Mr. Max Clarke, A.R.I.B.A. (London) then read a paper entitled "How to make Existing London Buildings more Fire-resisting," of which the following is a summary: One might admit at once that to make all existing buildings in London fire-resisting is a practical impossibility, so that you must take my remarks only as suggestions as to what might be done towards making buildings less inflammable than they are at present. Particular portions of the City of London have unfortunately got the reputation of being what are called dangerous areas. This may be due not only to the buildings themselves, but also to the nature of the goods stored therein, and for this class of building I am afraid little can be done The only thing we can hope for in this division of the subject is to render them less liable to communicate fire to those adjoining.

On the other hand, large numbers of buildings not having within them goods or materials of a particularly inflammable nature are built or fitted up, and particularly the latter, in such a manner as to render them very dangerous when by some unfortunate accident they do get on fire. Many of these buildings in their construction contain all the elements of danger, both to themselves and to their surroundings, and it is more particularly with regard to these that I call your attention. The idea of pulling down London wholesale, or converting all its buildings at one time into what are erroneously called "fireproof" structures is eminently absurd. Still, much might be done at a moderate expense which would render buildings and whole areas much less dangerous than they are at present.

Matchboard Ceilings and Partitions.

For instance, take the one item "matchboarding." It is used in all sorts of places, in most of which it could very well be done without as regards the construction, and it is a material which, so far as safety in case of fire goes, should not be allowed under any consideration whatever. Its use on walls and ceilings, particularly the latter, is much to be deprecated. I am now speaking more particularly of boarding made from soft woods, which when dry and painted or varnished is highly inflammable, the fire passing along it at a high speed, often rendering escape from a building impossible, even in the early stages of a fire. The limited use of hard woods as wall covering for decorative purposes is not objectionable, particularly if fixed without any air-space at the back.

We may now pass on to a form of construction which, alas, is even more common in London than the one above-mentioned, namely, leaving large areas of the floor joists of buildings without any covering whatever on the underside. This is done, of course, with the clearly-defined object of saving money in first cost, and it *does* save a certain amount; but whether that saving is commensurate with the greatly increased risk such a system of construction involves is for you to decide.

I need hardly remind you that the ordinary wood partition with its wood lath and plaster covering, leaving hollow spaces from top to bottom, *should* be a thing of the past.

Lift Enclosures and Doors.

I must now turn to a matter which seems to me to be most important in buildings of the warehouse class, namely, the means adopted at present for the prevention of the spread of fire in lift wells and generally in vertical shafts of this class There is no doubt that this particular risk is not sufficiently considered, and great improvement could be made as regards retarding the spread of fire if all lift shafts were properly enclosed with some form of non combustible material.

The doorways or openings to the lift shafts should not be mere openings, as is so often the case at present, or if the openings are fitted with doors they are too often of an open type, not in any degree preventing the passage of smoke and flame up the shaft. Iron doors are often fitted to openings, in cases where there is a solid enclosure; but the doors are not close fitting and the fastenings are not designed with a proper regard to ease in opening and closing, and quite regardless as to their adequacy for preventing the doors bending or twisting when heated to a high temperature. Where the latter is possible of course flame and smoke pass through the small openings and ignite inflammable material on the other side, thus *contributing* to the spread of fire to an alarming extent.

Another small matter I have observed in connection with iron doors, which should be avoided if proper fire-resisting qualities are to be obtained, is the total neglect displayed in keeping inflammable material at a sufficient distance from iron or other forms of fire-resisting doors. Only by exercising proper attention to this point can the full value of such doors be obtained. A door may in itself be a good stop against fire, though it become red hot; but it is useless if in contact, or in close proximity to, combustible material on one or both sides. Wood floors should not be carried up to the iron door frames, but a fairly wide threshold of concrete, stone, or the like should be formed on each side, and the same remark applies to the whole of the opening on both sides.

Fireplaces.

I shall now call your attention to some of the defects in fireplaces and flues which are being repeated every day in modern building work. Few know the number of fires caused by defects in and about the fireplace. Personally, I am disposed to think that most of the causes are brought about by careless workmanship, and a few perhaps by the use of methods which were quite adequate in former times, before the invention of what are now called slow-combustion stoves, close ranges, boilers, and the like. I place first in point of danger the practice of building half-brick trimmer arches to carry hearths in wooden floors, the arches having the centering left in and forming an open space under the brickwork. The underside of this space is lathed with wood laths and plastered in the same plane, as a rule, as the rest of the ceiling. This form of hearth should give place, in my opinion, to a concrete or other self-supporting hearth, the full depth of the floor joists, having a flat soffit on which the plaster could be applied direct. Next I should like to advocate the use of fireclay linings to all flues, a common practice in many districts, but not in use as a rule in London, where flues are generally improperly bonded and badly built with brickwork only 4½in. thick, in which bad mortar forms a considerable component part, and which after a time drops out, leaving the joints open; this is often assisted or caused by the nails, spikes, or plugs driven in for the purpose of fixing inflammable finishings. Wood finishings should not be fixed with iron spikes in front of flues unless the brickwork is of a greater thickness than 4½in., in fact it is probable that a great safeguard against fire would be effected if woodwork in such proximity to flues was abandoned altogether. It seems to me a cause of danger that flues built with only half-brick surroundings are at times used for high-pressure boilers, kitcheners, and the like, the brickwork being quite hot when work is in progress, and in many cases much too hot for safety. New types of stoves of either the "slow combustion" or "well fire" classes should not be fixed in old houses unless a thorough examination of the hearth and its surroundings is made, numerous fires having been caused from timbers being in close proximity to chimney breasts, quite unknown to the people who fixed new and powerful stoves in old openings.

Areas, Light Wells and Narrow Streets.

In cities like London, where land is of such great value, the size of areas and light wells will always be reduced to the smallest possible dimensions, thereby greatly increasing the risk of fire spreading from one building to another. The same remarks hold good with regard to narrow streets and courts. In cases such as these the only precautions which can be adopted are of a protective nature.

Windows in light wells should not be directly opposite each other, should be fitted with metal, or at any rate with hard wood frames, the glass should be wired or armoured so that when cracked it will not drop out of the frames at once, thus allowing the passage of flame from one building to another with fatal rapidity. In more dangerous cases blinds of non-inflammable material might be used with advantage, or, better still, shutters which would fit the openings closely, constructed in such a manner as to prevent much twisting or buckling, and provided with fastenings which, while admitting of rapid adjustment, would be secure against opening by accident or from falling bodies on the outside. Shutters or blinds for use in courts or areas might be made of woven wire mounted on frames. This form would admit of a certain amount of expansion or contraction without damage to the frame; would admit a certain amount of light, which is always an advantage, and could be seen through from the inside, often a benefit.

In connection with any form of shutters, such as above advocated, the objection to having wood finishings near them cannot be too strongly brought before your notice. Any real advantage the shutters might be in case of fire in an adjoining building would be largely discounted if inflammable material was close to the openings *supposed* to be protected by the shutters.

In Section III., "Storage of Oils and Spontaneous Combustion," presided over by M. Louis Bonnier, of Paris, papers were read by Captain J. H. Thomson (H.M. Chief Inspector of Explosives, London) on "The Storage of Explosives, Petroleum and Certain Chemicals within Densely-inhabited Areas"; by Dr. P. Dvorkovitz (Principal of the Petroleum Institute, London) on "The Necessary Safeguards for the Prevention and Spread of Fires in Petroleum Stores"; and by Dr. B. Redwood (Advisor on petroleum to the Home Office) and Captain Thomson on "The Prevention of Accidents with Petroleum Lamps"

In Section IV. "Fire Survey and Fire Patrols," addresses were delivered on "The Value of Fire Patrol Systems in Harbour Property," by Mr. W. H. Hunter (engineer-in-chief Manchester Ship Canal); on "The Influence of the Fire Service on Fire Prevention," by A. Dittman, (chief officer, Bremen Fire Brigade); and on "Some Notes on the General Fire Preventive Measures Adopted in Hungary, having Primary Regard to Rural Townships and Villages," by J. de Bolcs (Hungary).

Section V. "Fire Losses and Insurance," was presided over by Mr. Charles Hexamer, President, National Fire Protection Association, U.S.A., who read the first paper on "The Principles of Fire Insurance Practice in the United States." A paper on "Fire Prevention through Schedule Rating," afterwards read by Mr. H. Wilmerding, secretary of the Philadelphia Fire Underwriters' Association, and another by Mr. F. M. Guiswald, general inspector, Home Insurance Company, New York, on "Standards for Town Water Supply and Fire Protection from the American Insurance Point of View."

The Congress was resumed on Wednesday, Mr. Edwin O. Sachs again presiding. Mr. Guy Pym, M.P., first read a paper on "The Necessity of Placing Fire Brigades on a Sound Legal Basis," moving the following resolution: "That this Congress consider it most necessary that fire brigades should be placed on a sound legal basis, and that it is advisable for their efficiency that they should be supervised by a Government department." Sir William Preece seconded the motion, which was carried unanimously.

In Section I. (Building Construction and Equipment) the first paper was read by Mr. Bernard Dicksee, district surveyor, London, on "Fire Preventive Section of the London Building Act."

Mr. Ellis Marsland, district surveyor under the London Building Act, read a paper on "The Planning and Arrangement of Large Retail Commercial Establishments," which we summarize as follows:—

In considering the question of the planning and arrangement of large retail commercial establishments, there are at least four points to be taken into consideration. Firstly, the interests of the proprietor; secondly, the safety and convenience of the customer; thirdly, the local building regulations; and fourthly, the claims of the fire department.

Considering firstly the interests of the proprietor, they may be detailed as follows; — Plenty of window space, plenty of floor and wall space upon which he may erect his counters and fittings, and plenty of light, preferably from the north.

The customer requires ample staircase and elevator accommodation, plenty of gangway space, and easy exit and egress.

The building regulations may require a limited amount of cubical space; therefore the building, if a large one, will have to be divided into compartments, and these shut off from one another by fire-resisting doors.

The fire department claims that any outbreak of fire may be quickly localised, the occupants passed to a place of safety, and that short work be made of any outbreak by reason of its being attacked from more than one point. Also that adjoining premises be not unduly endangered.

This is the problem set the architect in planning and designing a building of this character. Much, of course, depends upon the site and its disposition.

I assume a site with the not unusual accompaniment of a frontage to two streets. The site, for the purposes of this paper, will have a frontage to the respective streets of 70ft. or 22 metres, and a depth of, say, 200ft. or 66 metres. It is also assumed that the building regulations limit the cubic capacity of buildings of this class to 250,000 cub. ft., as in the London regulations. This is done because I feel that dividing a building of this description into compartments is a right course, in the same way as it is considered the right principle for a vessel to be divided into watertight compartments. Assume for the purposes of the paper we place a building four storeys in height, which would mean some 55ft. from the ground floor to the level of the top of the topmost storey. The cubical contents of such a building would require that it be divided up into three compartments. I would adopt what may be termed the *well and compartment* system.

The proprietor has, I suggest, ample floor and wall space; his counters, fittings, and showcases can be disposed as he wishes, and the light is provided by means of large lantern lights from the roof, throwing a flood of light down the well on the several floors, in addition to any side lighting that, perhaps, might be available.

The customers have six ample staircases running from ground floor to roof, with an elevator provided to each. The door openings in the compartment walls are opposite one another and in direct line with the exits into either street. Should an outbreak of fire occur in any compartment, the customers on each floor would pass through the doorways, and could make a safe exit in either direction.

It is necessary that all the floors and supports be of fire-resisting construction, and all iron and steel work protected by concrete or hollow tile casing. There being nothing but the contents to burn, the task of the fire department would be a simple one for the following reasons: That a fire on any floor could be attacked from above and below. The openings in the party walls would be a means of getting readily at the seat of the fire, and at the same time affording a chance of escape in an emergency. The well and lantern would form a shaft for the escape of smoke, and the flat roof would afford access to this from the several staircases. The fire-resisting doors in the openings could with facility be closed, and the fire confined to one compartment.

In a building of this class it would be necessary to provide for receipt and dispatch of goods, and also for offices and staff accommodation. Any unpacking, packing, or bulk store department, if situated in the basement, should not communicate with the upper part, except by lift, placed outside the building, enclosed with walls carried up through the roof and covered with a light roof of iron and glass, and the openings on each floor protected with fire-resisting doors. It is advisable that the offices and counting-houses be in an adjoining annexe, and the dining and sleeping accommodation for the staff placed over and in this annexe, with separate exit and staircase and fire-resisting floors.

A. B. Markusowski, adjutant, City Fire Brigade, Budapesth, then read a paper in German, intitled "Some Notes on Fire Prevention, having particular regard to Theatre Safety."

In Section II. (Electrical Safeguards and Fire Alarms), presided over by Sir William Preece, papers were read by Mr. Alexander Siemens, PP.I.E.E., on "Safety and Control Arrangements for Fire Alarms" and Mr. G. H. Oatway (Glasgow) on "The Necessity for Automatic Fire Alarms with direct Brigade Communication."

Section IV. (Fire Survey and Fire Patrol) was presided over by Prince Alexander Lvoff (Russia), and papers read were by Mr. Gorham Dana (Inspector of Underwriters' Bureau, New England, Boston, U.S.A.) on "The Care of Private Fire Appliances," by M A. Goldoni (Milan) on "Fire Survey and Fire Watches in Theatres during Performances," and by Herr R. Czermack (hon. president of the Austrian Fire Brigades' Union) on "The Question of Technical Instruction for Volunteer Fire Brigades in the interests of Fire Protection."

Mr. Dana in his paper said that the chief desire of a large class of property owners seemed to be to get fire appliances installed to the satisfaction of the underwriters, in order that they could get their promised reduction in rate, and then to let the costly and complicated appliances take care of themselves. In some of the large department stores, where a large number of lives as well as large values were at stake, complete instructions and description of devices were issued to all employees. In the majority of plants, however, most of the employees knew little or nothing about the fire appliances, and in case of fire either wasted a great deal of time and work to poor advantage or else lost their heads entirely and accomplished nothing. The only way to care for such fire appliances was by systematic inspection.

Lieut.-Colonel Fox remarked that nothing was more dangerous than to have fire appliances stuck about the walls of a public building when they were not in an efficient condition. Until some kind of system of inspection was instituted he would not recommend rebates being given by insurance companies.

In Section VI., Mr. W. H. Merrill, jun. (the Underwriters' Laboratories, Chicago) read a paper on "The Testing Principles adopted at the National Fire Prevention Laboratory of Chicago," and Herr Jaffé (Berlin) another on "The Testing Principles adopted at the Royal Technical Research Laboratory, Charlottenburg, and at other fire tests in Germany."

The Duke of Marlborough presided in the evening, at the Criterion, at a dinner to the Colonial and Foreign Delegates to the International Fire Prevention Congress. He announced that he had addressed a telegram to the King tendering their good wishes and respects, and in reply had received a message stating that the King sincerely trusted that the deliberations of this important and representative body would lead to a further development as to the best means to be adopted in regard to the prevention of fire and to the saving of life in cases of fire.

M. Lépine, Prince Alexander Lvoff, Chief Officer Griersberg, Chevalier Goldoni, Professor Woolson, and Sir John Cockburn responded to toasts.

The concluding meeting of the Congress was held on Thursday. In section II. papers were read by Mr. E. C. de Segundo, A.M.I.C.E., on Electric Wiring and Electric Risks, by Mr. Hip. Cazier (Creil) on "Electrical Risks in Theatres," and by Mr. Alfred Hands, F.R.Met.S. (London) on "Necessary Practical Safeguards against Lightning."

In section III. Prof. Medem (University of Greifswald) read a paper on "Spontaneous Combustion," and Mr. F. W. Hardwick (Sheffield) another on "Underground Fires." Prof. Ira H. Woolson, of Columbia University, New York, read a paper on

"Non-inflammable and Fire-retarding Wood,"

of which the following is a summary:—

Among the various materials for reducing fire is the so-called "fireproof wood." First of all, let us have a clear understanding of what is means by the term "fireproof wood." Strictly speaking the processes of treatment do not make the woods *fireproof*, but simply render them fire retardants.

New York City is probably now using more fire-resisting wood than any city in the world. This results from two causes: first, the Building Law, which requires that such treated wood shall be used throughout all buildings over twelve storeys (or 150ft. in height); and secondly, to the fact that the city proper is too limited in area to spread, and enormously high buildings have become necessary.

It has been my privilege, under the direction of the Bureau of Buildings, to test most of the wood which has been used in these buildings. For the year ending the first of this month, I have tested and reported upon upwards of 3,500,000ft. The greatest part of this material was for floors, which were laid on the top of strictly fireproof floor construction of the concrete or hollow tile. The balance of the material was used for trim.

The impregnation of wood with chemicals to render it fire-resistant is by no means a new idea. Numerous experiments with various chemicals were made as early as 1825 by Fuchs, Gay-Lussac, Boucherie, and later by Löchtin and other continental chemists. However, it is within the last few years only that the business has been put upon a practical commercial basis.

Granting the value of fire-resistant wood as a structural material, the next problem is to determine what degree of fireproofness should be exacted, and how the standard of quality can be maintained.

In the early stages of experimentation it was customary to build a small house of the wood to be tested, usually duplicated by a house of untreated wood; then applying a vigorous fire both inside and out, and noting results. This method possesses spectacular elements which are very convincing, and while it may be useful as a general test to demonstrate the degree of immunity from fire that a wooden building may be made to possess, the heavy expenditure of time and money required for such a test precludes the possibility of employing it for regular series work. This is the only value such a demonstration possesses, for the results of fire tests made upon wood treated a year or so ago may bear no relation to the product of the same company to-day. It is essential for public safety that regular serial tests should be made upon all material delivered for use, as is the custom in the manufacture of steel, cement and other structural materials.

Unfortunately there is no recognised test for fireproofed wood.

An effort was made a year ago by the Building Bureau of New York City, in conjunction with the various fireproof wood manufacturing companies, to decide upon some standard method of test; but the project was abandoned. The present method of testing is as follows:—

When a shipment of lumber is prepared, an inspector proceeds to the works, and selects at random one sample from every 2,000ft. of material. This is sent to the laboratory and tested, reports being sent to the Building Bureau and the manufacturer. Two tests are applied to each sample. One a "shavings test," which is a test used by the U.S. Navy, and the other a test devised by the writer, which for want of a better name is called a "timber test."

The shavings test, while useful in a general way to determine the flaming properties of treated wood is, nevertheless, unsatisfactory. We are now making series of different tests in an endeavour to supplant it with something more reliable. The test is conducted as follows: a pan 1ft. in diameter and 6in. deep is mounted on legs. The bottom is formed by a heavy wire screen of $\frac{1}{2}$in. mesh. This wire bottom is covered with a layer of shavings 2in. deep, and a Bunsen burner is applied underneath for twenty-five seconds; then the burner is removed, and the lengths of time during which the shavings support (1) flame, and (2) glow are recorded, and also the area of shavings burned.

The idea of this test is that shavings from properly-treated wood will not support flame any considerable time, and that the flame will gradually die out without material enlargement of the burned area. After test, the remaining shavings are thrown away. There are no means for making a permanent exhibit of the results, except by photographs, which would be difficult to take and quite unsatisfactory. The wood must be accepted or rejected on the judgment of the operator, based upon notes taken while observing the test.

Besides these obvious disadvantages, there are two other strong objections to the shavings test: first, the extreme difficulty of always maintaining the same conditions of flame and heat under the shavings; and second, the impossibility of securing a uniform quality of shavings for tests. The most serious objection, however, to the shavings test, and the one which, in the writer's opinion, is fatal to its use as a standard method of comparison, is the impossibility of making the shavings of uniform size and quality.

To avoid the difficulties of this and similar tests, the previously mentioned "timber test" was designed. Though not entirely satisfactory, the results, as a whole, have been gratifying. During the past two years the writer has conducted over 4,000 tests upon fireproofed wood, the majority being "timber tests." Scarcely any criticism of the method of test has been offered by clients, though the results were often not gratifying.

The specimens for this test are accurately cut to a size $1\frac{1}{2}$in. by $\frac{3}{4}$in. by 12in. These "timbers" are tested in pairs by being laid across the top of a 6in. gas crucible furnace, in which a constant temperature of 926 degs. C. = 1,700 degs. Fahr. is maintained. This particular temperature was chosen because it is given by the New York Building Code as approximately the heat of a burning building. At the end of two minutes the specimens are removed, and duration (1) flame, and (2) glow noted for each.

The temperature is under constant control by means of a Le Chatelier pyrometer, the "couple" being placed between the two specimens, thus recording the heat exactly at the point of application. The proportions of gas and air are regulated to furnish a vigorous flame 8in. to 10in. above the furnace, so imitating an ordinary fire.

After test, the specimens are sawed in two at the middle and tracings made of the unburned wood. These tracings are then carefully measured by planimeter and the percentage ratios to the original cross-section calculated. The percentage of unburned wood is printed upon the tracing of each specimen, and then blue prints are made which become a part of the permanent record.

In general, the untreated woods show a cross-section area approximately 10 to 25 per cent. less than the treated samples. However, the value of the "fireproofed" wood cannot be rated by this feature alone. Account must be taken of the tendency to ignite and support combustion. This is indicated by duration of flame and glow after the specimen is removed from the fire. In every instance the contrast in time of flame and time of glow, between the treated and the untreated wood, is very marked. The average duration of each taken from 688 tests on four varieties of treated soft woods was 7 and 12 seconds. The same data taken from 846 tests on four varieties of treated hard woods was 10 and 14 seconds.

Similar calculations based upon tests of untreated wood, though not averaged from nearly so many tests, gave for soft woods, flame, 1 min. 19 sec.; glow, 1 min. 53 sec.; and for hard woods, flame, 2 min. 31 sec.; glow, 6 min. 29 sec.

Those figures give a ratio of 1 to 11 and 1 to 9 for flame and glow between treated and untreated soft woods, also 1 to 14 and 1 to 27 for hard woods. That is, the tendency of untreated woods to burn is 10 to 20 times that of treated woods. This measure of the property of retarded combustion is as important as the determination of the percentage of unburned areas, for in the first stages of a fire, minutes are valuable. Experience has shown that a variation of 5 per cent. should be allowed in cross-section area, because of structural differences in the wood, fluctuation in temperature, and personal error in measuring. In fact, like all investigative work, it is never safe to estimate average values from the results of a few tests.

The lumber is thoroughly dried before testing, and care exercised to keep everything uniform.

The specimens are placed so the side which was originally the outside surface of the board faces the fire. This is necessary because the Building Bureau permits 1in. outside treatment on floor sleepers and other large materials, which is encased in concrete or a coating of other fireproofed wood.

It will be noted that hard woods, like long leaf yellow pine, oak and maple, when treated, differ only slightly in unburned area from untreated lumber. They are naturally "slow-burning" material. It would scarcely be necessary to fireproof hard wood if the preservation of structural strength were the only consideration. But the danger from inflammability should make a surface treatment imperative. Soft woods which waste rapidly under flame should be treated throughout.

Although treated wood has many advantages as a fire retardant, it also has its failings, the worst being its tendency to become hydroscopic. There are processes which claim avoidance of this tendency to gather moisture when exposed to dampness, but I have had no opportunity to prove their merits. Because of this difficulty, the Navy has discontinued the use of fireproofed wood, except for interior trim, furniture, &c. When in this damp condition a new difficulty arises, because the chemicals employed produce a corrosion on metals. Neither of these difficulties appear harmful where the wood is ordinarily dry and protected by paint, varnish or oils.

A strong point in favour of the treatment is, that the wood does not seem to become perceptibly more combustible by the application of oils and varnish.

A further defect of treatment is to weaken the wood and make it brittle. Although this does not always result, it is a recognised possibility, and the Navy specifications reject material which has lost over 30 per cent. of its original strength.

Whether the treatments are permanent, I am not prepared to state. When used under ordinary conditions of dryness, and protected as it usually is, I see no reason why well treated wood should not remain sound and effective indefinitely. However, I believe, the question is one to be systematically investigated.

There are two other well-known defects, namely, discoloration and difficulty in working due to hardness. Both of these are increased by excessive treatment, hence the manufacturer is always tempted to lessen the treatment. This fact is the only argument necessary for regularly testing the material as delivered for use.

Last, but not least, from a builder's point of view, the wood is costly. But considering the awful destruction of life and property which fire constantly causes, the saving of expense should not be allowed as an excuse for the use of inflammable materials which invite public calamity.

In Section V. Mr. W. H. Stratton read a paper on "Fire Hazards in America from an Insurance Point of View," Mr. J. Sheppard one on "The Importance of Statistical Research for Determining the General Causes of Fire," and another by Mr. F. M. Grizwold on "Standards for Town Water Supply and Fire Protection from the American Insurance Point of View."

In Section VI. Chief Officer Welsch (Ghent), read a paper in French on "The Necessity of Generally Standardising Testing Operations"; Mr. Edwin O. Sachs, read the following paper on

"Proposed Standards of Fire Resistance."

The executive of the British Fire Prevention Committee, having given their careful consideration to the common misuse of the term "fireproof," consider the term "fire-resisting" more applicable for general use, and that it more correctly describes the varying qualities of different materials and systems of construction intended to resist the effect of fire for shorter or longer periods, at high or low temperatures as the case may be, and they advocate the general adoption of this term in place of "fireproof."

Further, the executive, fully realising the great variations in the fire-resisting qualities of materials and systems of construction, consider that the public, the professions concerned, and likewise the authorities controlling building operations, should clearly discriminate between the amount of protection obtainable or in fact requisite for different classes of property. For instance, the city warehouse filled with highly inflammable goods of great weight requires very different protection from the tenement house of the suburbs.

The executive are desirous of discriminating between fire-resisting materials and systems of construction affording *temporary* protection, *partial* protection, and *full* protection against fire, and to classify all building materials and systems of construction under these three headings. The exact and definite limit of these three classes is based on the experience obtained from numerous investigations and tests, combined with the experience obtained from actual fires, and after due consideration of the limitations of building practice and the question of cost.

The executive's suggested minimum requirements of fire-resistance for building materials or systems of construction will be seen from the standard tables appended for—I. Fire-resisting floors and ceilings. II. Fire-resisting partitions. III. Fire-resisting doors, but they could be popularly summarised as follows: (*a*) That temporary protection implies resistance against fire for at least three quarters of an hour. (*b*) That partial protection implies resistance against a fierce fire for at least one hour and a half. (*c*) That full protection implies resistance against a fierce fire for at least two hours and a half.

The conditions under this resistance should be obtainable, the actual minimum temperatures, thickness, questions of load, and the application of water can be appreciated from the annexed tables by all technically interested, but for the popular discrimination – which the executive are desirous of encouraging—the time standard alone should suffice.

Standard Table for Fire-Resisting Floors and Ceilings.

Classification.	Sub-Class.	Duration of Test at Least.	Minimum Temperature.	Load per Superficial Foot Distributed.	Minimum Superficial Area under Test.	Minimum Time for Application of Water under Pressure.
Temporary protective class.	A	45 mins.	1500° F.	Optional	100 sq. ft.	2 mins
	B	60 mins.	1500° F.	Optional	200 sq. ft.	2 mins.
Partial protective class	A	90 mins.	1800° F.	1 cwt.	100 sq. ft.	2 mins.
	B	120 mins.	1800° F.	1½ cwt.	200 sq. ft.	2 mins.
Full protective class -	A	150 mins.	1800° F.	2 cwt.	100 sq. ft.	2 mins.
	B	240 mins.	1800° F.	2½ cwt.	200 sq. ft.	5 mins.

Standard Tables for Fire-Resisting Partitions and Single Doors, with or without Frames.

Classification.	Sub-Class.	Duration of Test at Least.	Minimum Temperature.	Thickness of Material.	Minimum Superficial Area under Test.	Minimum Superficial Area under Test.	Minimum Time for Application of Water under Pressure.
					For Partitions.	For Doors.	
Temporary protective class.	A	45 mins.	1500° F.	2in. & under	80 sq. ft.	20 sq. ft.	2 mins.
	B	60 mins.	1500° F.	Optional	80 sq. ft.	20 sq. ft.	2 mins.
Partial protective class.	A	90 mins.	1800° F.	2½in. & under	80 sq. ft.	20 sq. ft.	2 mins.
	B	120 mins.	1800° F.	Optional	80 sq. ft.	20 sq. ft.	2 mins.
Full protective class.	A	150 mins.	1800° F.	2½in. & under	80 sq. ft.	25 sq. ft.	2 mins.
	B	240 mins.	1800° F.	Optional	80 sq. ft.	25 sq. ft.	5 mins.

It is desirable that these standards become the universal standards in this country, on the Continent and in the United States, so that the same standardisation may in future be common to all countries, and the preliminary arrangements for this standardisation are already in hand.

Builders' Notes.

The Additions to the Borough Sanatorium, Brighton, have been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with their patent double-fronted Manchester stoves in richly-glazed faïence.

Mr. Ebenezer Stiff has decided to retire from partnership in the firm of J. Stiff & Sons, of the London Pottery, High Street, Lambeth, S.E. His retirement will take effect as from April 1st last. Owing to continuous ill-health, Mr. E. Stiff has taken no part in the conduct of the business for some years past, and no difference in the methods or management of the firm will result from his retirement.

The Gordon-Bennett Cup Race.—It is interesting to note in connection with this race that the tents occupied by the timekeepers and route-guardians were supplied by the Willesden Paper and Canvas Works, Ltd., and also that the flags—triangular and square—having direct signalling signifiance were made of Willesden paper. This latter was necessary owing to the curling propensities of ordinary bunting. Willesden canvas was also much in evidence in connection with car covers, &c.

Law Cases.

An Insurance Test Case.—At the Bolton County Court last week Robert W. Kenyon, builder, Spa Road, sued the Life and Health Assurance Association, Ltd., Edinburgh, for indemnity under a policy of insurance. A large number of builders were in court, as the action was regarded as a test case. In November last, one of plaintiff's workmen, a man named James Crook, was working at Messrs. Blair & Sumner's bleach works. He was helping in the erection of an iron pillar, when the pillar fell and caught Crook, who succumbed to his injury. At the County Court arbitration the widow of Crook was awarded a sum of £130. Plaintiff was insured with the association, who repudiated liability and resisted the claim. For the defence, it was contended that the work in which Crook was engaged was of a hazardous nature, that plaintiff did not sufficiently disclose the class of his business, that the work done by Crook did not come within the terms of the policy, and therefore plaintiff was not entitled to indemnity. Judge Bradbury found that the work was covered by the policy, and gave a verdict for £166 14s. 4d., with costs. It was intimated that the verdict would be appealed against.

SANITARY INSTITUTE CONGRESS.

THE twenty-first Annual Congress of the Sanitary Institute was opened on Tuesday, July 7th. The president, the Earl of Stamford delivered his inaugural address at the Technical College in the evening. He said he would direct attention not so much to the scientific side of sanitation as to its general aspects and scope, to its effect upon history, and to its application by means of political and administrative methods. For without such application duly organised and co-ordinated, all the scientific knowledge in the world became practically of little avail. Now that entomology had taught us that the malaria germ was borne through the air by the anopheles mosquito, he hoped hygiene might enable us to deal with that evil and relegate tropical fever to the limbo of the sweating sickness, and thus open up the resources of the rich but deadly regions of West Africa.

The president went on to speak on the subject of modern sanitation in its connection with the home. The scientific study of matters affecting the public health had, he said, resulted in the accumulation of a mass of knowledge and information as to the effect of overcrowded and unhealthy dwellings on the national health. Much of the ill-health and disease in slums was directly traceable, not to the neglect or default of the landlords, but to the personal defaults of the poor who dwelt in them. Vicious and drunken habits and disregard of personal cleanliness were powerful factors with which it was difficult to deal by legislation. The only way to cope with personal neglect would be by education of such people, or by the education of their children. But it was not sufficient that the child should be taught merely to observe certain hygienic regulations. The moment was singularly appropriate for directing special attention to this most vital question of hygienic training for teachers.

Referring to the conditions of factories and workshops, the president said in spite of this immense advance, in certain noxious trades and in the "sweated" industries, many of the evils and horrors of the old pre-factory system days were being faithfully reproduced. A little consideration, however, would show that the partial failure of the Factory Act was due not to any inherent weakness in the system itself, but to imperfections in the law, the chief of which had been (1) the insufficient powers given to local authorities; (2) the overlapping of functions between factory and sanitary inspectors; and (3) the lack of any adequate control by which compulsion might be brought to bear upon defaulting local authorities.

"In drawing your attention to noxious trades and 'sweated' industries," the president added, "I desire to enforce the view that they are not only injurious to the persons more immediately concerned, but to the whole nation."

Speaking of bacteriology, the president referred to a new discovery, or rather departure, of this science. As we already knew, the life-products or excreta of micro-organisms were inimical to the organisms themselves, and to that extent protective to the human being inoculated with them, but the substances contained in those products were in some cases irritants to the human body. It would, therefore, be a great step if the life-juices of the bacteria could be extracted so that the active principle contained in their bodies could be utilised unmixed with the noxious excreta. By means of liquid air pathological bacteria were now rendered brittle, and could be ground up so finely that their cell-contents became accessible and could be extracted.

In regard to sewage disposal, the growth of population and its increasing density, especially in our urban districts, made the question of the treatment and disposal of sewage more and more important every year, and the full solution of this much vexed and much discussed problem was undoubtedly one of the most urgent and important aims of sanitary science. The intimate relation of the question to the pollution of streams and rivers, and to the purity of our water supply generally, added to its interest and importance.

In dealing with the sewage problem there was a most important practical matter which preceded the question of treatment. He referred to a matter of the greatest interest to the inhabitants of the West Riding of Yorkshire, namely, the passage of trade effluents into the sewers and their consequent mixture with domestic sewage. The Commissioners had paid special attention to the question of trade effluents, and had come to the conclusion that while the existing law was apparently precise, the difficulties attendant on its application in any particular case rendered uncertain the position and rights of any particular manufacturer. The Commissioners believed that the only cure was to alter the law and the alteration they recommended was that it should be "the duty of the local authority to provide such sewers as are necessary to carry trade effluents as well as domestic sewage, and that the manufacturer should be given the right, subject to the observance of certain safeguards, to discharge trade effluents into the sewers of the local authority if he wishes to do so."

The Corporation of Bradford, however, strongly dissented from the views of the Commissioners, and urged that all traders should be entitled to discharge the trades effluents into the public sewers upon terms which should be uniform and based on standards, and that in all cases provision should be made by traders for removing solids from, and regulating the flow of the effluents into the sewers. "It may be questioned," continued the president, "whether there is really so much difference between the Commission and the Corporation as the latter appears to think."

Whatever differences of opinion there might be as to the mode of dealing with the trade effluent, all parties appeared to be quite content to make the Rivers Board the tribunal of appeal in disputes between the manufacturer and the local authority. If legislation was to follow the reccommendations of the Commission, the setting up of a central authority would be of the utmost importance, for it would be the co-ordinator of the scheme of reform. It would form a new department of the Local Government Board, and its first duty as soon as set up would be to constitute rivers boards for suitable areas all over the country. In constituting them regard would be had to the following considerations:—(1) They would be created to enforce the Rivers Pollution Prevention Act; (2) each should have jurisdiction over a whole watershed; (3) the area would be sufficiently large to secure skilled officers.

But the advantages of such a central authority did not end there, for it might exercise supervision and control over all important matters affecting water supply. Some of these were brought prominently before the Local Government Board in October last by a large and very influential deputation representing, in addition to that Institute, the County Councils Association, the British Association of Waterworks Engineers, and the Underground Water Preservation Association. The deputation emphasized three points: (1) The pollution of rivers and other sources of water supply; (2) the taking of water for sale outside the area of the supplying authority, to the detriment of local interests in the areas from which it is taken; (3) the waste of water.

At the conference of municipal representatives on Wednesday Mr. M. S. Briggs read a paper on

Cottages for Agricultural Labourers,

of which the following is a summary :—

The so-called cottages erected by artists and other bohemians to recruit in the country at the week-end are also of no use as types to follow. The published plans of such places seem to be chiefly composed of "ingle-nooks" and "dens," and utter disregard for sanitation. Much may be saved by an architect who has a practical knowledge of the cost and worth of his material. Good stone cottages, with parlour, living-room and detached washhouse, cost £350 to £400. The cost of a good brick cottage, such as we build in blocks of from two to four, is hardly ever less than £200, and the necessary rent is heavy for a labourer's pocket. Concrete cottages can be built for slightly less than this. The idea of a common-room in cottages built in small blocks seems to be rather Utopian. Such a room is generally employed either as a reading-room, parlour, or washhouse. The last is most feasible, perhaps, but we have yet to find the happy spot where two or three separate families will sit, eat or work harmoniously together without the strife of tongues. In designing cottages the prejudices of the cottager must be taken into account, as well as regard for his health.

First of all we must determine the accommodation required on the ground floor. On this point there is the greatest diversity of opinion and practice, but we may assume as indispensable a living-room, free from such furniture as a sink or copper; secondly, accommodation for the said sink and copper, with provision for all dirty work to be done there; thirdly, a ventilated cupboard or small room to serve as a larder. As optional we may class a parlour and a detached washhouse. The most elementary type of plan I have seen is that adopted by the Liverpool Corporation for their concrete flats. Here there is only a living-room, 15ft. by 10ft. 3in., with a large fireplace, and sink and copper together occupy a space of only about 4ft. by 3ft. 6in. at the back. The want of a larder is here evident, as a living-room cannot be kept cool enough for the storage of food. The space for washing is also too small. It should be remembered, however, that these flats only cost £100 each. The Guinness Buildings in London and Dublin, erected since 1889, have living rooms of 150 sq. ft. area, and a ventilated food-cupboard; common washhouses and bathrooms are provided. The new model dwellings at Bristol (1901) have living-rooms 14ft. by 14ft. (1st class), or 14ft. by 13ft. (2nd class), and washhouses 8ft. by 4ft. 6in. The living-rooms are well lit, have kitchen grate and oven, and the washhouses contain boiler and small coal-cupboard. From these examples we may assume the following as absolutely essential: (i) a living room of 150 sq. ft. area, containing a range; (ii) a ventilated food cupboard; (iii) a small washhouse or scullery with copper or sink. To these I should like to add an innovation, namely, a bathroom. We will now consider two types of plan in detail, of which most others are modifications. (*a*) The front door enters a lobby about 3ft by 3ft., with stairs (2ft. 10in. to 3ft. wide) running up, and with the living-room door on the left. The living-room is 160 sq. ft., and includes a large fireplace and plenty of cupboards. A good left-hand light for cooking is needed. The best room, whether kitchen or parlour, should face towards the road. The height of these rooms downstairs is a matter of much difficulty. Various experienced men hold that a height of 7ft. 3in. to 8ft. is sufficient. The by-laws insist on 8ft., but many model dwellings are made 8ft. 6in. to 9ft. 6in.

On the whole, for an ordinary small dwelling, 8ft. seems high enough where no gas is burnt. Out of the living-room one door opens into the larder. This need not exceed 3ft. in width, but should have shelving, best in stone. This small room of course should have a window if possible, but if not, air-grates will suffice. The other door from the living-room enters the scullery (10ft. by 6ft.), which in a cottage of this sort is the most difficult part of the plan. In a recent article in the BUILDERS' JOURNAL by Mr. Wyand, a most interesting solution of the problem was given. In a space only 6ft. by 5ft., room is found for a sink, a 20-gallon copper, and a bath with hot and cold water supply. Mr. Wyand explains that such a system would provide a bath for an additional cost of £3, as against £30 required for a small bathroom and hot-water supply with the cheapest of fittings. This seems a most successful solution of a longstanding difficulty, and the fact that the scullery is not in use when the bath would be required is an additional factor in its favour. The sink should be of the Scotch pattern or "jaw-box," which can be used as a wash tub. Cold supply only is needed. Many authorities consider that a cottage scullery sink should not be trapped, as traps are apt to get out of order, but should be emptied by an open pipe to discharge over a "Duckett's" 3-gallon tipping basin kept above the ground. The drainage of such cottages as we are considering is now carried out almost exclusively on the E.C. system. The E.C. should be isolated from the house, but must not be far away. House refuse is best kept in the galvanised dustbins sanctioned by the by-laws, these being much better than brick ash-pits. The second type of plan differs from the first in that a parlour or sitting-room is added. Such a room need not be made as large as the living-room and need not have a large fireplace, but should be well lit and entered from a front lobby. The sink must in any case be kept out of these inhabited rooms. In my opinion the parlour is quite an unnecessary adjunct, as a large well-lit kitchen is up to the expectations of the agricultural labourer. Detached washhouses of course have obvious advantages and where money permits may well be adopted. The size should be about 8ft. by 6ft. As an accepted canon of decency a cottage for a family must have three bedrooms. The area of bedrooms should not be less than 80ft., and one of them, at least, should be larger. When cottages are built with only two bedrooms I consider that the local authority should have the power of limiting the number of inhabitants. Every bedroom should have a small mantel register fireplace. As the labourer will sleep with a closed window we must give him higher rooms. This height may be obtained in the roof. Rooms with the slope of the roof forming a large part of the ceiling may be made even warmer than an ordinary flat plaster ceiling by laying the tiles on a bed of concrete plaster over the backs of the rafters. In the discussion that followed Mr. F. W. Jowett (Bradford) urged that in building cottages provision should be made for good-sized gardens. A garden attached to a house was of greater value than an allotment some distance away, because the occupier could work it in his spare moments. Mr. E. B. Jay (Epsom) held that it was impossible to have sanitary houses until the people had been educated in habits of cleanliness. He hoped the rural district councils would not impose any unnecessary restrictions on cottage property, which would raise the rents.

At the conference of Medical Officers of Health on Wednesday, Mr. T. F. Cass, of Hull, read a paper on "Some Aspects of the Sanitary Control of Bakehouses," from which we have summarized the following points in relation to design and construction.

Bakehouses.

Very common structural faults in bakehouses arise from the methods of construction of the floors and tops. Many of the older floors are composed of brick on edge, or 9in. sq. paviours laid in sand. The ideal pavement for either ground floors or upper floors of bakehouses is undoubtedly good Portland-cement concrete, laid in such a manner as to be easily cleansed by washing. The only objection to concrete is that the workmen complain of its dryness and heat affecting their feet, causing hardness of the epithelium to such an extent as to give severe pain. This objection is probably a valid one, but doubtless the difficulty could be overcome. The tops of many bakehouses are made simply of the joists and wooden floor or the story above, or if the building is of one storey only the top may consist of a pan-tile or slate roof, open to the spars and tiles or slates, as the case may be. Such tops are, to say the least, very faulty; they do not admit of proper cleansing. All ceilings should be plastered, or otherwise properly lined. The reason for sufficient yard space and secondary means of approach to buildings used as bakehouse is so obvious that I need not enlarge upon it, except to say that I have known places where the soil and filth from privies have had to be carried through bakehouses because there was no other road.

All the requirements of the Factory and Workshops Act and the Public Health Acts relating to water supply, sanitary conveniences, drains, ash-pits, and sleeping apartments should be strictly complied with. The floors and tops should be free from dampness and constructed of, or lined with, a smooth impervious material (preferably the floors of cement concrete, walls lined with glazed brick or tiles, and the tops of cement concrete on steel joists). No wooden casements or matchboard linings should be allowed. The floor space of any workroom should not be less than 150 superficial feet; the depth of the floor below the highest ground level adjoining or nearest to the bakehouse should not be more than 7ft.; the height from the floor to the ceiling should in no case be less than 8ft. 6in., and the ceiling should not be less than 3ft. above the highest ground level, which will be found to be quite little enough for the purposes of lighting and ventilation.

Windows should be provided in all workrooms equal to not less than one-tenth of the floor space, made to open directly to the open air close to the ceiling, and to half the extent of the window area. No window should extend below the ground level except in the case of windows looking into an open area not less than 3ft. in width and free from any obstruction of light. No underground bakehouse should be considered suitable in which it is necessary to use artificial light during any period of ordinary daylight. In addition to the windows, adequate and suitable means of permanent ventilation should be provided, also means for carrying away any vapours or fumes *directly* from all ovens and gas-stoves into the open air or chimney flue should be provided. Through ventilation should be insisted upon.

No drain should be allowed to pass immediately over any part of the bakehouse or oven, and there should be a free space of about 2ft. between the walls of the oven and any wall of the bakehouse which is backed by the earth above the level of the bakehouse floor, and all area gullies should be provided with suitable valves to prevent flood waters from the sewers entering the building. The approaches to an underground bakehouse should be by means of properly constructed and efficiently lighted stairs, furnished with proper hand-rails, and, if internal, with proper screen and door above ground level. No step ladders should be accepted, and no trap-doors or hatchways should be allowed in the ceiling of the bakehouse for any purpose whatever.

Public Baths.

Mr. Snell also read a paper on "Public Baths; the Influence of Planning and Construction upon the Cost, Maintenance and Adminstration." The following is a summary: The idea that any sort of site is good enough for baths is radically wrong. It has been responsible in London especially for the selection of some of the most extraordinary sites which have taxed the ingenuity of architects to use to advantage. Such sites almost invariably entail straggling, and therefore uneconomical plans.

Not infrequently "Service corridors" are provided, but they are a useless expense. It is always preferable to make it impossible for the superintendent to go about the building without passing through one or other of the departments. The attendants are more likely to keep their sections in order if they are liable to be overlooked at any time of the day. In the older baths (and indeed it is the case with some modern baths), it was no uncommon thing to find four separate entrances for bathers, one for each class of each sex. Nowadays, more frequently two entrances only are provided, one for each sex. One pay office therefore suffices, whereas under the former system two at least were necessary. The services of a money-taker, or rather *two*, are thus saved, representing at least £150 per annum in wages alone. Waiting-rooms to swimming baths are so little used that they would seem to be scarcely necessary. In spite of rules and regulations to the contrary, bathers generally crowd round the bath itself and stand about the footways. This is, of course, exceedingly inconvenient and subversive of order. It is not preferable to let bathers in waiting sit or stand in the gallery. Another move in the direction of economy is the abolition of the slipper bath in favour of the spray bath. It is scarcely necessary in these days to compare the merits of the two systems, although it is surprising to find how slowly the latter is replacing the former in view of its undoubted superiority. I will only here remind you of the features which recommend it on the grounds of economy, viz.: It occupies just about half the space of the slipper bath, and uses half, or less than half the water necessary for the former. In an establishment of, say, fifty baths, the saving in the structure and fittings alone would probably exceed £40 per bath, or, say, £2,000, and supposing that each bath was used on an average during the year three times daily, water would be saved to the extent of over 1,000,000 gallons, which at 6d. per 1,000 = £25, or the interest on over £800,. To this must be added the saving in fuel, &c., in heating the water, and less cost of attendance. I believe that a well-appointed and arranged set of spray baths, each with its separate dressing-room, and with common warm and plunge baths, would attract better-class bathers in paying numbers. Well-equipped Turkish and Russian baths at a moderate price should also prove paying departments. Special or medical baths are probably more suitably attached to hospitals or hydropathic hotels. A great deal might be done also to make baths more attractive and inviting. I may instance the circumstance of one particular bath in London which is certainly not better planned nor decorated, nor better, nor indeed so well fitted as many others, and yet it is, or used to be, the most favoured bath in the metropolis. The only reason for its popularity appears to be that the whole establishment is tastefully decorated with growing ferns, which flourish exceedingly well in the warm moist atmosphere of a bath.

Intercommunication.

It is desirable that all the warm baths should be as close together as possible. I remember some time ago reading the description of a design in which the author in effect drew attention to the fact that every section of his scheme was carefully separated from every other, so that there could be no communication between them. I refer to this description merely because it represents the very antithesis of what should be the architect's aim in the arrangement of baths. I should add that his plans showed the warm baths arranged at three different floor levels. The only divisions required are, in the first place, for the separation of the sexes (and this should commence from the general entrance hall), and secondly, separation of the classes, which need only commence at the waiting rooms immediately adjoining the baths. Referring to the plan of the St. Marylebone Baths, you will see that the first and second class bath sections in the case of both men and women are divided by doors only, so that each set is, in a way, interchangeable, and by this arrangement a minimum number of attendants is required, and in the slack hours one only would be sufficient for both classes of each sex.

One of the most important parts of a bath scheme, especially from the point of view of economy, is the engineering scheme. The boilers and engineering works generally should be of the best description and designed on the most economical lines for the highest efficiency, and by this is meant commercial efficiency, and it is better to reorganize, if necessary, the whole of the engineering plant of an establishment, even at considerable cost, than to waste powder and fuel year after year with inferior plant.

Owing to the excessive wear and tear upon all fittings, it is a matter of great importance that everything should be of the most substantial construction. The unavoidable moisture in the atmosphere in baths necessitates glazed or other impervious surfaces for the walls and floors. The importance of absolute cleanliness in every part of the establishment calls also for the avoidance of all angles, mouldings and other repositories for dirt, as much as if the buildings were for hospital purposes. Solidity and simplicity in construction materially affect the question of first cost, and, to an even greater degree, maintenance charges.

The Congress Lecture.

What is known as the Congress Lecture was delivered on Thursday at the Technical College by Mr. John Slater, B.A., F.R.I.B.A. Mr. Slater said he should endeavour to bring before the Congress some of the points of contact between hygiene and architecture, taking each of them in their broadest aspects. He remembered nearly four and twenty years ago, in a paper read before the Royal Institute of British Architects, mention was made of an architect of some eminence at that time who had built a house for a client, and some four months after its completion this architect was asked to come down and inspect the house because some of the drain pipes were stopped and there were difficulties with the plumbing arrangements. The architect was most indignant, and simply told the client to send for his plumber. There is a wider aspect of the question which has not often been dealt with, namely, how far the purely artistic side of architecture is concerned with hygiene. There could be no doubt that since the principles of sanitation had been known and carried out, the percentage of cures of all kinds of diseases had enormously increased. And yet, how much better were prevention than cure! Every year, in the outskirts of all our large towns, acres and acres of new sites were covered with houses for the lower classes, which, even when they were new, were scarcely sanitary. A great advance had been made in artisans' dwellings, which now had the greatest possible attention given to their construction, but as soon as one got just above the artisan class, the poor struggling clerk or the shopman and the small tradesmen, one would find that the dwellings themselves were not one whit better than they were fifty years ago. The fact was that of late years the working man had monopolised the attention of the benevolent and the charitable. "I should like to see some capitalist take up the cause of the lower middle classes and start a company for the erection of middle-class dwellings at reasonable rents, and as our municipalities are going in for commercial speculation, they might find this not one of the least profitable. I know that the Artisans', Labourers', and General Dwellings Company, which has gone on these lines, has always managed to pay a dividend." The fact was, we wanted fewer hard and fast lines laid down, and literal specification of requirements in our Building Acts and by-laws, but more discretion left in the hands of those who had to carry out these legislative enactments. This opened up one of the most important questions relative to the health of the people; he meant the standing and qualifications of inspectors and other officials, who had practically the whole matter in their hands. What did we see all over the country? A local builder, who had failed in business, got some kind friends to propose him as building inspector, or perhaps even surveyor, to the local council. In his opinion the appointment of every health officer in the country, and the amount of his salary, should be subject to the approval of the Local Government Board, and then they might make the Acts themselves which have to be carried out much more elastic. The lecturer having given a description of the manner in which attractive looking suburban houses, letting at from £20 to £30 per annum, were sometimes built, and that in many of these, as soon as cases of infectious disease had been nursed in them contamination commenced, and in a few years, it was his firm belief, such houses become what in a hospital ward would be termed permanently septic, and it was almost impossible to get them sweet.

"I am no socialist, but I cannot shut my eyes to the fact that the improvement of the dwellings of the people is a question which is intimately bound up with that of the ownership of the land on which they are erected, and until we can get rid of the middleman in the shape of the speculative builder, who only cares to put up his buildings at the lowest possible cost, we shall never improve the separate small dwellings of the people." He saw no reason why the lower middle classes of this country should not be trusted to fulfil their obligations, and he would not be surprised if, in the next generation, the Government were to take up the question of loans to small householders for the purpose of helping them to buy their own freehold sites and build their own houses. Discussing the question: How far is the health of a people affected by the artistic or æsthetic side of architecture—by matters which are not constructional, but are connected with site, arrangement of plan, surroundings, style, and design? the lecturer said that it was the opinion of an eminent oculist that a great deal of the defective eyesight which was annually becoming more and more prevalent in towns, was due to the fact that these urban dwellers looked so seldom on the pleasant restful green of the woods and fields and so constantly on dull bricks and mortar. Staring, garish, inharmonious tints must have a somewhat similar effect through the eye on the brain as loud, cacophonous sounds have through the ear. He would be sorry to see huge blocks of artisans' dwellings multiplied in the heart of our great cities. The object should be to get the workers away from their work when it is finished by increasing the facilities for quick and cheap transit. It could not too often be dinned into the ears of the governing bodies that upon the health of the people depended the wealth and well-being of the nation.

Engineering and Architecture.

Mr. Maurice Fitzmaurice, C.M.G., president of the second section dealing with engineering and architecture, delivered his address in the Technical College on Thursday, in which he dealt with modern problems for engineers. Referring to the sanitary works in which he had had a part, or which were now under his control, he said that owing to the deaths which had occurred at several places in England from eating shell-fish contaminated by sewage, public attention had been drawn to the question of the disposal of sewage at several places, and London, among others, had not escaped criticism. About 1889 it was thought that the question of the disposal of the London sewage was settled when the system in use at the present time—namely, chemical precipitation and the conveyance of the sludge to sea—was decided on. The installation of this system was immediately accompanied by a wonderful improvement in the Thames.

Previous to 1890 the crude sewage was delivered into the river, while now the precipitated sludge, to the extent of 7,000 tons per day, making a total of over 2,600,000 tons per annum, is carried by steamers to deep water fifty miles below the outfall at Barking and Crossness. The clarified effluent, amounting to 230,000,000 gallons per day, is discharged into the river at the outfalls. He hoped in a very short time that the London County Council would be able to announce the steps which they proposed to take for the further purification of the Thames.

Turning to the question of locomotion in cities and towns, he said he hoped the time might come when a very large proportion of the working classes would think nothing of living six or seven miles from the place where they were employed, and would find that practically no inconvenience was caused by doing so. This state of things would be facilitated by the construction in large cities of underground railways, but in addition to the traffic on underground or elevated railways, an increasing amount of traffic would be carried on the surface of the streets, either by electric tramcars or motor cars. It was necessary to keep the entrances to towns, and the country roads approaching them, of a good width, so as not to throttle the traffic at these places at a future date. The development of motor traffic ought, from a sanitary point of view, to be encouraged. When it was considered that 45 per cent. of the dust carried by the air in streets was composed of organic matter, principally stable manure, it seemed more than probable that a diminution in the number of horses in the streets must be accompanied by an improvement in the general health. The provision of streets and roads of ample width, and the satisfactory maintenance of such thoroughfares, are the best means of encouraging the development of electric trams and motor traffic.

The Sewage Question.

The section then proceeded to consider and discuss three papers upon the sewage problem. The first paper was one entitled, "A Comparison of Chemical and Septic Tank Systems as preludes to Artificial Filtration," and was by Mr. Douglas Archibald, F.R.Met.S. Mr. Archibald said that one of the most prominent features of modern sewage treatment and disposal had been the substitution of bacterial decomposition for chemical precipitation in tanks, before any subsequent filtration over land or artificial beds. The main impulse in this case had been not so much the desire for greater purification as for the elimination of the sludge. The problem would always remain a complex function of several variables. Efficiency of purification, limitations of area, depth, local nuisance, capital and annual expenses, renewals, &c., had all to be considered. In an elaborate statistical paper the author showed that the choice of treatment, according to the lessons which had been gradually learnt, lay between tank settlement of the sewage with or without septic action, and tank settlement aided by chemicals. His experience was in favour of the last-mentioned system.

Mr. W. Kaye Parry read a paper on "The Present Position of the Sewage Problem." He remarked that at the Congress of the Sanitary Institute held in Leeds in 1887, a group of papers was read, each of which had a direct bearing upon the sewage purification question. In the discussion which followed, one of the speakers, with a pardonable touch of sarcasm remarked that they were fortunate in getting that morning from the authors of these papers no fewer than three complete solutions of the sewage problem. Proceeding, Mr. Parry summarised the work done during the past few years, and pointed out the importance of a careful consideration of the cost of the different systems. He complained that sufficient evidence was not given to the public and to engineers of the cost of the installations of the septic method.

Professor Henry Robinson, M.I.C.E., followed with a paper on "The Bacterial Treatment of Sewage," in which he drew special attention to some principles of bacteriological treatment which resulted from experiments made a few years ago by the State Board of Health of Massachusetts, but which, he said, seemed to have been overlooked by subsequent experimenters.

Mr. A. Saxon Snell, F.R.I.B.A., contributed a paper on "Details of a Hospital Ward," in which he discussed the various materials and methods of construction best to be pursued in hospital construction, special attention being devoted to expedients for preventing dust and dirt. We shall publish a summary of this paper next week.

The business of the Congress terminated on Friday, and in the course of the proceedings the sections devoted to engineering, architecture, physics, chemistry and biology held a joint discussion for dealing with the questions of sewage treatment and disposal and of rivers pollution. Mr. K. F. Campbell, M.I.C.E., contributed a paper on the experiments in the treatment of sewage which he had been conducting in Huddersfield, referring to the difficulties encountered in giving practical effect to some of the most used methods of sewage treatment, owing to the presence of a large quantity of fat and trade waste in the local sewage.

Major H. R. Firth read a paper by Mr. W. D. Scott-Moncrieff on "The Standardising of Sewage." Mr. Scott-Moncrieff said that in the treatment of sewage by the biological methods a certain amount of empiricism naturally entered into the matter, and the results attained were frequently arrived at rather by accident than by legitimate argument. With the view of reducing to definite factors the conditions of working he proposed the use of an apparatus which he had designed and the drawings of which were exhibited.

A paper by Mr. C. F. Wike, M.I.C.E., City Surveyor of Sheffield, dealing with experiments carried on in the sewage department of Sheffield, was also placed before the conference. A paper by Mr. A. G. Leigh, entitled "Manufacturers and the Rivers Pollution Prevention Act," was also submitted.

THE HEALTH EXHIBITION.

The Health Exhibition of sanitary apparatus, appliances, and articles of domestic use and economy, which is being held in connection with the Congress, was opened at the Belle Vue Barracks on Tuesday by the Mayor of Bradford, Alderman David Wade. The exhibition will remain open to July 25th. There is a large number of stands, and the exhibition promises to be a great success.

The preliminary list of awards made by the judges were announced yesterday as follows:—*Silver Medals:* British Sanitary Co., for self-acting earth closet; Burn Brothers, for cast-iron drain pipes and fittings; F. C. Calvert Co., for carbolic acid preparations; Davis Gas Stove Co., Ltd., for diamond Metropolitan cooker; J. Duckett & Son, for isolated syphonic closets; W. Glover & Son, for new roadway water sprinklers; Northern Vacuum Cleaner Co., Ltd., for vacuum cleaners; Wilson & Stockall, for brougham ambulance, with convertible stretchers; Wilson & Stockall, for accident ambulance van. *Bronze Medals:* Ames Crosta Sanitary Co., for trapped drain box for tramway rails; Ames Crosta Sanitary Co., for stoneware conduits for electric cables; Ames Crosta Sanitary Co., for surface water gullies; Anti-Vibration Incandescent Lighting Co., for anti-vibration incandescent gas lamps of various patterns; Bradley Star Tap Co., for equilibrium and compensating ball, bib, and meter taps; Burn Brothers, for square gully plug; Burn Brothers, for "Times" drain plugs; Joseph Cliff & Sons, for "Newcliff" intercepting trap; Joseph Cliff & Sons, for Hessell-Tiltman scum channel for swimming baths; Joseph Cliff & Sons, for Imperial registered bath; Doulton & Co, for gunmetal mixing valve for hot and cold water; George Freeman & Co., Ltd, for the "Priory" aluminium bath; George Freeman & Co., Ltd., for Brown's penny-in-the-slot lock for water-closets; Hard York Non-slip Stone Co., for "non-slip" material; J. Hirst & Sons, for adjustable gully channel grates; J. Hirst & Sons, for slop shutes; Holroyd & Co. for excellence of porcelain ware; Kilgerm Co., Ltd., for sprayer for applying liquid disinfectants; Law & Ormerod, for Law's improved dry seats; Henry Leggott & Co., for Leggott & Marsh's smoke-consuming independent range; W. & R. Leggott, Ltd., for general excellence of door and window furniture and brass castings; Mellin's Food, Ltd., for Mellin's food; Moule's Earth Closet Co., for pedestal earth closets; J. Oakes & Co., for glazed stoneware; Patent Sanitary Scoop Co., for gully scoops; C. Pratt & Son, for sick-room furniture; J. S. Reckie & Sons, for air-testing plugs, gauges, and fittings; T. M. Rimmington & Son, for ærated waters prepared from Bradford Corporation water, filtered through porcelain; Ronuk, Ltd., for Ronuk; Sanitaries, Ltd., for combined ash-bin stand and cinder sifter; Sanitary Bin Co., for sanitary bin with self-locking door; Slack & Brownlow, for germ filter with preliminary strainer; H. H. Thompson, for barrel tilter; A. G. Thornton, for general excellence of surveying and drawing instruments; George Barber Wilson, for gully dredger.

The following are a few of the more interesting exhibits:—

Joseph Cliff & Sons.

A large and attractive stand (No. 16) is that of Messrs. Joseph Cliff & Sons, Branch of the Leeds Fireclay Co., where the glazed bricks and general sanitary ware of this firm are well shown. A speciality of the stand is the show of hospital fittings.

Horsfall Destructor, Ltd.

This exhibition contains some items the relation of which to sanitation seems remote, but this cannot be said of the exhibit (stands Nos. 1 and 113) of a portable destructor shown by the Horsfall Destructor Co., of Leeds. This destructor is capable of developing 20 h.p. from any and every sort of refuse —we have seen it flourishing excellently on decayed fish!—and the company is prepared to lend it on hire experimentally to sanitary authorities. It is no make-shift, but a real Horsfall Destructor on a small scale, and should be taken most seriously into consideration by small councils whose districts will not bear the cost of a large destructor.

Oates & Green, Ltd.

Closets, latrines and urinals in various designs and salt-glazed ware are shown at stand No. 21 by Messrs. Oates & Green, of Halifax, including their white enamelled "Taper" urinals, with sloping back.

W. & R. Leggott, Ltd.

Window gearing and door plates and furniture generally form the staple of a very artistic exhibit (stand No. 67) by Messrs. W. & R. Leggott, Ltd., of Bradford, whose designers have succeeded admirably in their door furniture and finger plates.

Doulton & Co., Ltd.

The exhibits of this world-famous firm are always interesting, and that at stand No. 38 in this exhibition is no exception. A number of articles in white-glazed fireclay are shown, and the perfection of the glaze should be especially noticed.

Shanks & Co., Ltd.

Messrs. Shanks & Co. show their new "Modern" wash-down closet, and also their school board closet, at stand No. 2, which has been adopted by the Manchester and other important school boards. The usual attractive lavatory fittings are also displayed at this stand.

W. Summerscales & Son, Ltd.

A curious exhibit (No. 63A) is the curtained sanctum of Messrs. W. Summerscales & Son, of Keighley, upon which is displayed a notice to the effect that they are too busy to exhibit, but will be pleased to show visitors over their works. Probably this astute method is far from unremunerative.

Fireproof Plate Wall Co.

Stand No. 53 of the Fireproof Plate Wall Company, of Bradford, is of interest. The erection is composed of thin partitions of from 2½in. to 4in. thick, fire-resisting, and practically sound-proof. One of the chief features about the partitions is that they are absolutely rigid, and while easily erected, economise space.

Mather & Platt, Ltd.

The exhibit of this firm at stand No. 24 is described as a model of a complete sewage purification works, but it really is of fairly large size and in actual working during the greater part of the day. It comprises Detritus chamber with screen, sedimentation or septic tanks, valve chamber with patent automatic distributing apparatus, and bacteria beds.

Matthews & Yates, Ltd.

Messrs. Matthews & Yates, of Swinton, Manchester, have a stand (No. 39) where their electric fans were in full blast. A special feature of this firm's work is the patent apparatus for sucking up the shavings, &c., from the joinery benches in workshops, and so saving the untidy and inflammable litter generally associated with the woodworker's operations.

Meldrum Bros., Ltd.

At stand No. 18 models will be found of two destructors, one known as the top-feed "Simplex" and the other the front-feed type. The Meldrum destructor furnaces are in conjunction with steam generators of the water-tube type. The capacity of the "Simplex," which has a grate area of 75 sq. ft., is from 40 to 50 tons of refuse per day of 24 hours, while the boiler evaporation is equal to from 450 to 600 gals. per hour nett; allowing 20lbs. of steam per i.h.p., this equals 225 to 300 i.h.p. per hour. The address of the company is Timperley, Manchester.

The Shannon, Ltd.

This firm are exhibiting on stand No. 52 all their well-known office labour-saving devices, comprising the rapid roller damp-leaf copier, filing system and cabinets of all descriptions, card index recording systems, vertical filing cabinets, the Shannon sectional cabinets for building up as requirements grow, and also several of their well-known desks in remarkably cheap lines from £5, office furniture, chairs, &c. The head office and showrooms of Messrs. The Shannon, Ltd., are at Ropemaker Street, London, E.C., but they have also a branch office at 33, Charles Street, Bradford.

Holroyd & Co.

This firm exhibits at stand No. 28 a display of imperial porcelain ware, which is its great speciality, and consists of two porcelain baths and fittings, a few lavatories also in this ware, and cast-iron porcelain-lined bath and fittings, two syphonic closets. A magnificent porcelain 6ft. bath, parallel shape, on pottery feet, and with a wide 4in. roll, is shown, together with a 5ft. 6in. Victorian bath of oval shape and base to floor. The very high finish of these goods and their beautiful glaze obtained for the firm a bronze medal for "excellence of porcelain ware." The crystal drinking fountain attracts considerable attention, and was awarded a bronze medal. This excellent invention projects water straight into anyone's mouth, and so prevents any possibility of disease germs lodging as happens with the insanitary cup usually seen at public fountains.

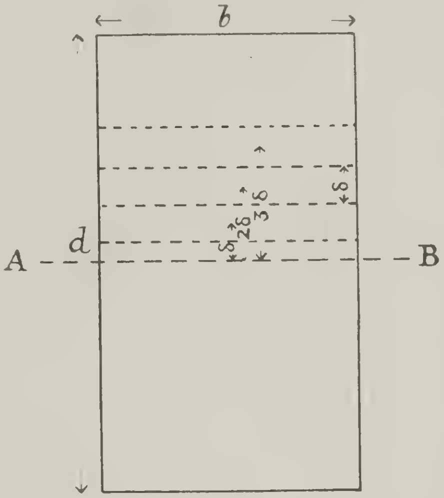
Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Radius of Gyration.

CLAPHAM.—ELÈVE writes: "Please give a clear definition of radius of gyration."

The moment of inertia of a body about an axis is the sum of the products of the weights of the particles of which the body is made up by the square of the distance of each particle from the axis. If we can imagine the whole weight of the body to be concentrated in a single particle, and this particle placed at such a distance from the axis as that the moment of inertia would be the same as that of the body, the distance of the particle from the axis is the radius of gyration. What I mean by a particle is a volume of the substance whose dimensions are very small. If then we know the moment of inertia, I, of a body about a given axis, the radius of gyration is $\sqrt{\frac{I}{m}}$, where m is the mass of the body. It may be of use to explain that moment of inertia is a quantity that occurs primarily in kinetic mechanical questions; for example, if I is the moment of inertia of a wheel referred to its axis, the kinetic energy in the wheel is proportional to IW^2, where W is the angular velocity of the wheel. Now, what has this to do with cross sections, which are not solids, but are plane surfaces? We find it convenient to talk of the centres of gravity of lines and surfaces, though such things have no mass, and consequently have properly no centre of mass; just in the same way it is useful to apply the terms moment of inertia and radius of gyration to plane figures. The student may, if he finds it convenient, suppose the plane figure to have a very small uniform thickness. Suppose the figure to represent a cross section of a rectangular beam, and suppose AB is the neutral axis through its centre, let us take a small rectangle whose area is δb, and the distance of whose centre from AB is δ, its area × (its distance from AB)² is $b\delta \times \delta^2$; take another like rectangle and we have $b\delta\,(2\delta)^2$, and another gives $b\delta\,(3\delta)^2$, &c., till we reach the top of the section we have $b\delta^3\,(1+2^2+3^2+4^2+\&c.+n^2)$, where n is the number of the top rectangle; if now δ is supposed to be very small, the $\frac{\delta}{2}$ which we left at AB may be neglected, and n becomes very large, but $n\delta = \frac{d}{2}$. Now, if you try, you will find that the expression $\frac{n\,(n+1)\,(2n+1)}{6}$ will give you the sum of the squares of n consecutive numbers beginning with 1. Satisfy yourself by trying 2 and 3 and 4, &c., separately $= n$; for example, let $n = 3$, $\frac{3 \times 4 \times 7}{6} = 14$, and $1+2^2+3^2=14$. This expression is found by very elementary algebra. When δ is taken very small so that n is very large, the expression $b\delta^3\,\frac{n\,(n+1)\,(2n+1)}{6}$ is the moment of inertia of the upper half of the cross section about AB. Now, when n is taken "infinitely" large — just as if a man has a million pounds, the giving away of one will make him very little poorer — we may write the expression $\frac{b\delta^3 n^3}{3} = \frac{b\left(\frac{d}{2}\right)^3}{3} = \frac{bd^3}{24}$, and the moment of inertia of the whole cross-section is twice this, or $\frac{bd^3}{12}$. Now the area is bd, and the radius of gyration is $\sqrt{\frac{bd^3}{12bd}} = \frac{d}{2\sqrt{3}}$. If a cross section can be divided up into rectangles, its moment of inertia may be found by finding the moments of the rectangles about the given axis and adding them together. There is also the simple law, that the moment of inertia about any axis is equal to the moment of inertia about an axis through the centre of gravity plus the area multiplied by the square of the distance of the centre of gravity from the new axis (the axes being parallel). Another important point to remember is that the moment of inertia of an area about an axis at right angles to the plane of the area is the sum of the moments of inertia about two axes in its plane at right angles to one another and intersecting in the point where the first axis meets the plane. This has all already been explained in the articles on "Building Construction," and you might have been referred to them, but I know from enquiries addressed to myself that young men who have not got a smattering of the "higher" mathematics are anxious to have an elementary explanation (which needs to be repeated with some patience, and the thing is worth doing). In my youth I read a book entitled "An Elementary Treatise on Rational Mechanics," by the Rev. John Kerr, M.A., published by William Hamilton, 33, Bath Street, Glasgow, and Simpkin & Marshall, London, which uses only elementary algebra. It is not any the easier to read on this account, but for a young fellow who has the perseverance to worry through that book (a small book of less than 300 pages in large type), I can think of no more mentally healthful exercise. I don't say that these particular things are to be found in it. P.



Keystones.

Royal Academy Architectural School.—It is announced that the following students of the Royal Academy have been transferred to the Upper Division of the Architectural School:—A. W. Blomfield, A. E. Bullock L. G. Delmar, J. Swarbrick and L. Wilkinson.

Mr. F. R. Farrow, F.R.I.B.A., has resigned the chairmanship of the commercial section and membership of the executive of the British Fire Prevention Committee and also the title of Hon. Publications Secretary of the International Fire Prevention Congress.

Hereford Cathedral West Front. — An appeal has been issued by the Bishop of Hereford for £5,000 towards the rebuilding of the west front of the nave of Hereford Cathedral. A further sum of £5,000 will be required to complete the restoration of the front of the north and south aisles. The work is to be carried out after designs by Mr. Oldrid Scott, a son of Sir Gilbert Scott, and it is hoped to complete the restoration within the next three years.

The Wellington Monument.—A bronze-coloured facsimile of Stevens's plaster model of the equestrian figure for the Wellington Monument has been placed in position in St. Paul's for inspection by the public during the current week, and by this step the Executive Committee has fulfilled the pledge made some months ago. It should be perfectly understood that the figure is an absolute facsimile of the original model left by Stevens, and untouched save for the addition of the missing hoof and tail which have been copied from Stevens's small sketch model at South Kensington. The pedestal on which it stands has been temporarily constructed in wood from Stevens's later drawings, superseding the more elaborate form shown in the sketch model. Mr. M. H. Spielmann, doubtless under the sting of impending defeat, penned another of his rancorous epistles to the *Times* a few days before the public exhibition, in a vain endeavour to impute bad faith on the part of the Executive Committee. No one, however, who now sees Stevens's crowning composition for his life-work can fail to prefer it to the possibility that might be evolved by the Academical nominee, whose Leighton memorial lies hard by Stevens's work for cruelly handy comparison.

Obituary.

Mr. John Gardner, builder, of Melton Road, King's Heath, Birmingham, died recently at the age of sixty-nine years.

Mr. T. Staton, builder, of Torquay, died last week at the age of eighty-three years. He was born in Charles Parish, Plymouth, in 1820, and went to Torquay when thirteen years of age. He had therefore resided in the town for seventy years, and had seen its growth and taken part in its up-building. For many years he was in the employ of Messrs. Harvey Brothers, and eventually commenced business for himself, and retired about fifteen years ago.

Bricks and Mortar.

Aphorism for the Week.

The Grecian . . . with its perfectness unanswerable as Euclid, self-contained—the one thing finished in this hasty world.

LOWELL.

Our Plates. THE house at Wallingford, of which Mr. Reginald Morphew is the architect, will be built of red bricks faced with smooth plaster finished white. The timber framing to the gables is to be of oak filled in with red brick and plastered. All the external joinery is to be of oak. The windows will be glazed with antique Dutch glass and the leads will be flat and ½in. wide. The roofs will be covered with bright red sandy tiles. The hall and living-room will be panelled in oak and have oak joists showing in the ceilings. The floors will be of oak laid in narrow widths and wax polished. The walls of the drawing-room will be hung with rough pale green canvas and the frieze will be stencilled in various shades of amber on natural-coloured canvas. The woodwork is to be painted white, finished with a stippled surface left flat. An aviary with tiled floor leads out of the drawing-room and will be heated in winter by a small radiator from the kitchen boiler.

Sewage-Polluted Windermere. MR. HENRY W. STOCK, F.R.I.B.A., writes to the "Times" in regard to the proposed sewage scheme for Windermere. He says: "A Local Government Board inspector will hold an enquiry and, like his predecessor, will no doubt recommend the granting of the necessary loan to enable all the additional sewage of this fast-growing neighbourhood to be poured on to the saturated land by Parsonage Bay, Bowness-on-Windermere, where already the shore is fouled by black sewage ooze, and the reeds grow more rankly year by year in the shallows. . . . . Half the charm of river and lake is derived from the purity of their waters, and Windermere and Bowness, with all their well-to-do residents, can well afford the extra cost of buying moorland away back from the lake and pumping and treating the sewage there, as is done at other places where low rates are not allowed to be the paramount consideration. . . ."

A Liverpool Insurance Building. THE new head-office building of the Royal Insurance Co. at Liverpool occupies a commanding site at the corner of North John Street and Dale Street, in the heart of the commercial district. It has been designed by Mr. J. Francis Doyle, the well-known Liverpool architect, and the work of construction has been carried out by Messrs. Thornton & Sons, also of Liverpool, under the supervision of Mr. Doyle, with the assistance of Mr. R. Norman Shaw, R.A., as consulting architect. The style is Classic, adapted to modern requirements. The substructure is of grey Aberdeen granite a height of 300ft. above the pavement level, the superstructure being of white Portland stone, roofed with green slate. On the Dale Street front is a gable rising 110ft. above the pavement. The main entrance is placed in North John Street, and is surmounted by a tower 130ft. high, which forms one of the principal features of the design. At the south end is the entrance for tenants. Another notable feature of the building is the general office of the company on the ground floor, which is quite free of columns or obstructions of any kind throughout its full length. This has been achieved by a novel principle of steel construction, the first and second floors being slung from girders which are placed upon the third floor and rest upon steel stanchions built into the walls Internally, marble, wood-panelling and faïence are largely used for facing the walls in lieu of the ordinary plaster, this material being reserved for ceilings only. The building, rectangular in shape, is about 220ft. long by 52ft. wide. The internal dimensions of the general office on the ground floor are:—Length, 194ft.; width, 48ft.; and height, 21ft. The offices of the manager and chief officials are on this floor facing Dale Street, separated from the general office by a hall 20ft. sq. On the floors above accommodation is provided for the numerous departments incidental to the conduct of a world-wide insurance business, while the basements are reserved for strong-rooms and store-rooms. The boardroom is a large apartment on the first floor, 44ft. long, 24ft. 6in. wide and 27ft. 6in. high. The walls are panelled in Italian walnut to a height of 19ft., and from the cornice of this panelling rises a vaulted ceiling which is panelled and enriched in plaster. Suspended from the ceiling are three antique brass candelabra adapted for electric lighting. These candelabra are of interest, having been made in the town of Utrecht in 1648–9. The firegrate in this room is also interesting, being an original made by Alfred Stevens. On the upper floors, at the south end of the building, are commodious offices for tenants, electrically-worked lifts being provided. The whole of the interior is lighted by electricity and heated by hot water on the low-pressure system. The exterior of the building is enriched by an imposing piece of sculpture over the main entrance, and by a frieze consisting of several large sculptured panels, which were designed and executed by Mr. C. J. Allen, sculptor, of Liverpool, in conjunction with the architect.

Correspondence.

The Strand Improvement.

To the Editor of THE BUILDERS' JOURNAL.

LONDON, W.

SIR.—Apropos of "The Strand Improvement" permit me to point out that the Architectural Vigilance Society, which is raising its voice on the question of the Strand Improvement, is a self-elected body, representing only the opinion held by a small section of London architects and artists. There are a great many architects, well respected in their own profession, who strongly deprecate the idea of "Architectural Shirt Fronts," advocated by the Vigilance Society, and consider that the elevations of buildings should be the honest expression of the purposes for which the buildings are used; whereas the uniformity desired by the Vigilance Society would result in the expression of the taste of a few gentlemen who wish to dictate a preconceived style of architecture, thus excluding those who hold that modern architecture should be the outcome of modern conditions, thoughts and aspirations. By allowing each lessee to select his own architect, and build to suit his own requirements, a chance at least would be given for the creation of a few interesting buildings in the new thoroughfare. But if the "shirt front" principle of design is adopted, we shall have a lifeless display of scholastic revivalism.—Yours truly,

C. F. A. VOYSEY.

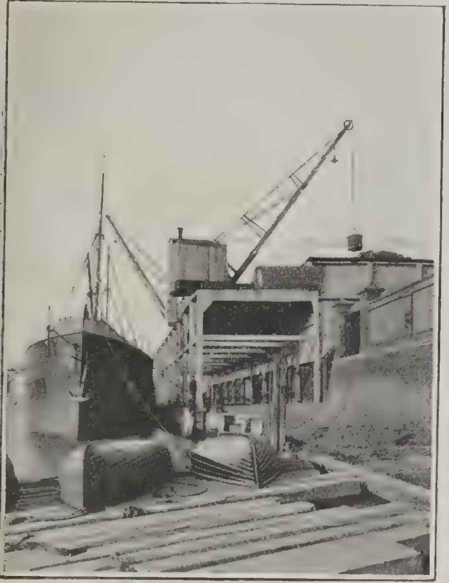
HENNEBIQUE'S FERRO-CONCRETE CONSTRUCTION.

It is only two or three years since that peculiar method of construction known as "ferro-concrete" was introduced into this country from France, where it has leapt with surprising rapidity into public favour for all kinds of buildings and many branches of constructional work for which few persons would have thought it was suitable; but during that short time it has made great strides. It has been proved, however, to possess many advantages over ordinary building methods, its two principal being cheapness and rapidity of construction. Many systems of iron-concrete construction have been originated here and on the Continent, but the one which is generally admitted to be the best is that invented by M. Hennebique, of Paris, with whose name the progress of this method of construction has been connected. As an instance of the importance the method has assumed in France we may instance the fact that the French Government recently created a separate department at the Ministry of Public Works, under the management of M. A. Considère, chief engineer for Ponts and Chaussées (who is the author of standard works on the principles of this kind of contruction), to give attention to all matters elating to ferro-concrete construction, with view to its greater development. It will e seen from this that the method has now ot beyond the experimental stage.



COAL SILOS AT RUDMORE.

The Hennebique system of ferro-concrete onstruction gained the Grand Prix at the Paris Exhibition in 1900 for its inventor, M. Hennebique, of Paris. M. Hennebique's atents are being worked in this country by Mr. L. G. Mouchel, of 38, Victoria Street, Westminster, S.W., who has recently pubshed a large pamphlet explaining the Iennebique system and giving particulars f tests, &c. The volume is well illustrated, nd the large number of examples show how xtensively the system has been applied, and ll readers of this journal who are interested in ne system should write to Mr. Mouchel for a opy.

Mr. Mouchel is a member of the Institution f Civil Engineers of France and has had a ery considerable practice in the application of rro-concrete to all kinds of work. It is, of ourse, a difficult problem to work out all e calculations for the somewhat involved resses in a steel and concrete structure, and erefore Mr. Mouchel generally acts as a ecialist under the architects or engineers who plan the buildings and get out the general design, and the work is executed by English licensed contractors, each of whom works an agreed district.

The general principles which apply in ferro-concrete construction are that the iron shall be so disposed in the concrete that it takes all the tensile stresses, and the concrete takes all comprehensive stresses. The concrete, of course, binds the steel bars together and protects them from damage by fire and oxidization. The great advantages of the system are that girders and columns are so quickly and so cheaply constructed. This is due to the fact that the steel sections used can always be bought in the market, and are not subject to such fluctuation and shortage of supply as built-up sections, which, furthermore, are very laborious to construct. In fact, a girder or column can be constructed in ferro-concrete with fewer men in about half the time it would take to get a built-up girder or column constructed, and it has been found that a building can be erected in ferro-concrete in about one-third the time it would take if specially built-up steel stanchions and girders were used. In addition to the saving of cost in this matter of labour, considerable saving is effected in the expense of annual painting, a necessity with exposed ironwork. The loss of available section due to riveting in the case of built-up steel sections is avoided.

The system, light in construction, gives graceful lines in design, is practically imperishable, and resists fire remarkably well. It might be thought that the adhesion between the iron and the concrete would be destroyed by changes in temperature, but this has been proved not to be so, for the co-efficients of expansion and contraction have been demonstrated by M. Durand-Claye, chief engineer of the French Ponts and Chaussées, to be identical to the fifth decimal. The adherence between steel and concrete is estimated by Professors Baushinger and Ritter at 570lbs. per sq. in. Tests have been made which show that the strength of ferro-concrete construction is practically unimpaired by fire, even when water is turned on from a fire hose on the heated walls and floors. No better system could therefore be adopted than Hennebique ferro-concrete where buildings are required to be fire-resisting. With regard to the all-important point of the preservation of steel when encased in concrete, experiments have gone to show that oxidization does not occur even after many years' subjection to sea-water.

A very material advantage of ferro-concrete is that buildings constructed of it have an almost entire absence of vibration, a fact of the greatest importance in factories, workshops, &c., which carry machinery. This is especially valuable in bridges.

The special features of the Hennebique system are as follows:—In a beam of ferro-concrete the axis of compression is at the top and the axis of tension below, exactly as happens in a rolled steel joist. Now, in the ferro-concrete the compression is resisted by concrete and the tension by the iron bars. But concrete would not alone suffice to form the web (still comparing the ferro-concrete beam to a rolled joist), as it might be subject to tension and slipping. M. Hennebique has therefore devised the system of distributing stirrups along the whole length of the beam, which, embedded in the core of concrete and connected intimately with the upper and lower portions of the beam, makes a solid and compact girder capable of bearing the heaviest loads. These stirrups are formed of hoop-iron of a proper gauge and width. The tension bars are of two kinds, namely, straight bars parallel to the lower face of the beam, and bent or cranked bars placed over them, but in the same vertical plane. The bent bars, taken in connection with the straight bars and the stirrups (the latter being placed closer together at the ends of the beam), constitute an indeformable triangle, and the resistance afforded to shearing strain thus increases near the supports, *i.e.*, where this strain reaches its maximum. A beam so formed is very similar to a timber beam trussed with iron tie-rods and brackets. Any bending strains of the lower bars thus become transmitted to the upper part of the beam and transformed and distributed in the way of compressive strains in the mass of the concrete.

In addition to its use for buildings, the Hennebique system is as largely used for engineering work. Piles are made of ferro-concrete which can be driven in exactly the same way as ordinary piles, and of course possess the advantage over timber and iron of being practically indestructible. They can be moulded to any length or section and driven to any depth without scarfing. Mr. Mouchel is about to construct, on the Hennebique system, a large jetty at Purfleet for discharging and landing goods, of which Messrs. P. W. & C. S. Meik, of 16, Victoria Street, Westminster, are the engineers. This suggests itself in connection with the projected improvements in the Port of London as the very thing to solve the problem of loading and discharging ships in the river.

The following are a few of the works executed in this country by Mr. Mouchel, on Hennebique's system of ferro-concrete construction: Great Western Railway Company's Warehouse at Nag's Head, Borough, S.E.; flour mill and grain silos at Swansea for Messrs. Weaver & Co., Ltd.; warehouse, grain silos and flour mills for the Co-operative Wholesale Society at Newcastle-on-Tyne; immense cold stores at Southampton, constructed on ferro-concrete piling; foundations for electric car sheds at Bournemouth; extension of workshops, Old Foundry, Hull; warehouses at the Royal Albert Docks and Plymouth Docks for the Great Western Railway Company; cattle wharf at Liverpool; sheet piling at Christchurch, Hants, and at Northam; coal barge quay at Southampton for the London and South-Western Railway; jetties at Dagenham, Essex, at Woolston, Southampton, and at East Cowes, I. W.; coal silos at Leeds Electric Light Works.

In addition to his head office at 38, Victoria Street, Westminster, Mr. L. G. Mouchel has branch offices at Grosvenor Chambers, 16, Deansgate, Manchester; Maritime Chambers, Southampton; and at 18, Victoria Square, Newcastle-on-Tyne.

THE LONDON

OF OUR

FORE-FATHERS

is rapidly disappearing, and many picturesque bits of Old London have already been demolished to make room for modern requirements.

The following Photogravures (reproduced by the Rembrandt Process), from originals by Mr. F. L. Emanuel, form a lasting record of many of these interesting buildings.

No further copies can be published, as the plates have been destroyed, and the pictures are therefore quite unique.

Single Copies at the following Prices:—

1. **The "Old Horse and Groom,"** Back of Holborn - above - Bar (since demolished).	6d. each.
2. **Holywell Street,** from St. Clement Dane's Church (since demolished).	2s. 6d. each.
3. **The "Old Bell,"** Holborn (since demolished).	1s. 6d. each.
4. **Leather Lane,** Holborn	1s. 0d. each.
5. **Davies Street** (since demolished).	9d. each.
6. **Fetter Lane,** View from Holborn.	6d. each.
7. **King Street,** Westminster (since demolished).	1s. 6d. each.
8. **Staple Inn,** Holborn.	2s. 6d. each.
9. **Milford Lane,** Strand, and Booksellers' Row, looking West (since demolished).	6d. each.
10. **Lincoln's Inn Fields.**	1s. 6d. each.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

July 22, 1903. Vol. 17, No. 441. 9, East Harding Street, E.C.

A London Case of Vandalism. A SCANDALOUS state of things is existing at present in regard to the Westminster Improvement Scheme, due chiefly to the Ecclesiastical Commissioners, who are of course notorious for mismanagement, but also to the connivance of the London County Council. It is proposed by the Ecclesiastical Commissioners to demolish the delightful old residential quarter immediately south of Westminster Abbey (which has a wealth of historical and archæological associations), and to sell the sites to speculators and business firms for the erection of commercial offices. The surroundings of Westminster Abbey have already been enough degraded by obtrusive office buildings. Vigorous protests by residents, members of Parliament, antiquarian societies and eminent artists are being made against the action of the Ecclesiastical Commissioners, and it is to be hoped that Parliament will take steps to save London from the destruction of one more of the quiet and beautiful old-world corners of the metropolis and a breathing-space from the roaring streets. One would have thought the Ecclesiastical Commissioners, of all bodies, would have had regard for old associations and for art. Though the body has a large number of members, very few ever attend its meetings, and the officials are left to do as they please. These officials grossly mismanage their trust. The Commissioners possess plenty of inferior property which they might very well demolish before they even consider the advisability of touching such streets as Great College, Barton, Cowley and North Streets, and Smith Square, all consisting of fine old Georgian work, with beautiful canopied doorways and ironwork, and good interior woodwork. The Commissioners have a reputation for being grasping ground landlords, and in their present action have acted most harshly towards their tenants.

In 1897–8, it will be remembered, a private syndicate endeavoured to get a Bill through Parliament to extend the Embankment to Lambeth Bridge, to acquire the property south of the Abbey, and erect thereon large blocks of offices and flats. So great an outcry was raised against this by the tenants of the Ecclesiastical Commissioners, the London County Council and others, that the House of Commons rejected the Bill. Sir Alfred de Bock Porter, secretary to the Ecclesiastical Commissioners, on their behalf congratulated the tenants, when they presented a memorial praying for the preservation and permanent peaceable possession of their houses, on the rejection of the Bill, and promised not to tamper with the properties and to renew their leases. In 1900 the London County Council promoted a Bill which among other improvements proposed to carry out the improvement to the embankment. This Act, which received royal assent on August 6th, 1900, contained clauses which gave the L.C.C. power to take any lands they might require for the purposes of the improvements. They were prevented, however, by strong opposition of residents from tampering with Abingdon Street except at the northernmost end, which they propose to round off. Only a small area at the end of Great College Street was required for the improvement, yet in April, 1901, the tenants of the whole of the area bounded by Little College Street, Great College Street and Wood Street were given notices to treat. This must have been done with the approval of the Ecclesiastical Commissioners' officials, for though the Commissioners individually did not know it a secret agreement had been made under seal with the Council that the latter should not take any property without the former's expressed consent. Most of the property was held on twenty-one years' leases determinable at seven, fourteen and twenty-one years, and many of the tenants had spent large sums on alterations, &c., on the strength of the assurance that the Commissioners would let the leases run the full term. The Council, however, only offered compensation for the years yet to run to complete any of the three divisions of the lease, and thus many of the tenants lost considerably. The Council in their usual way put the tenants to every annoyance with the object of getting them to leave or to depreciate the value of the property, and they even evicted tenants before juries were summoned to settle compensation, as they had no right to do (there were several cases of severe hardship). They finally gained possession about August, 1902. The houses were pulled down on the orders of Messrs. Clutton, the agents of the Commissioners, and immediately after the Commissioners began to get out the foundations on the site for their new offices, which are now being erected. This means that the Council have done the Commissioners' dirty work, broken the leases for them and acquired the properties at the cost of individuals. This, we presume, the Commissioners' officials consider honourable. Perhaps the Secretary (who we are surprised to learn is a Dissenter) thinks such action befits the Church of England. And what are the London County Council to get as their *quid pro quo?* Are the Council thinking of erecting their own offices in this locality?

The Commissioners have followed up this action by leasing to a railway company a house (No. 1) in the Abbey Garden which was built for a canonry, and as it is within the precincts of the Abbey this must have had the approval of the Dean and Chapter. This step should be retracted at once, for if it goes on we may expect St. Dunstan's wall in Great College Street to be pulled down and the Abbey Garden built upon. The Commissioners have allowed an ugly block of offices to be erected in Little College Street, and an equally pretentious and ill-proportioned building is now being erected by their side for the Lancashire and Yorkshire Railway Company. Nos. 14 and 15, Great College Street, and 4 and 5, Cowley Street, which back on them, have been leased to the North Eastern Railway Co., who probably propose to pull them down and erect further pretentious offices out of character with the neighbourhood. We beg the company, if they cannot see their way to abandoning these premises, to only alter their internal arrangements, and leave the old fronts standing. The buildings at the west end of Great College Street in Tufton Street have been pulled down, and the site leased to a speculative architect. The other half of the corner, in Barton Street, is now being demolished, and it is stated that premises are to be erected on it in which to provide additional rooms for the Westminster School.

On no consideration should the remaining houses in Great College, Barton and Cowley Streets be demolished. The houses on the north side of Smith Square, facing St. John's Church, ought also to be preserved; at any rate, the corners if rounded off as proposed would look most ugly. There is no reason either why the old houses in North Street should be pulled down. The late Dr. Temple, Archbishop of Canterbury, said it would be utterly wrong and indefensible for this neighbourhood of substantial and well-built houses to be altered for any purpose. Members are constantly lamenting the want of residences close to the Houses of Parliament, and yet these are being destroyed. Mr. Owen Fleming in a paper read before the American Institute of Architects at Washington, and reported in the Journal of the Royal Institute of British Architects for June 27th, referred to the "old rookeries and slums which now obstruct and confuse the southern view of Barry's masterpiece." This is a very ambiguous statement, and might be taken to refer to the whole of the quarter affected instead of the buildings along the east side of Millbank Street, as he no doubt meant. In any case, the statement that the houses in the locality are rookeries or slums is a gross libel.

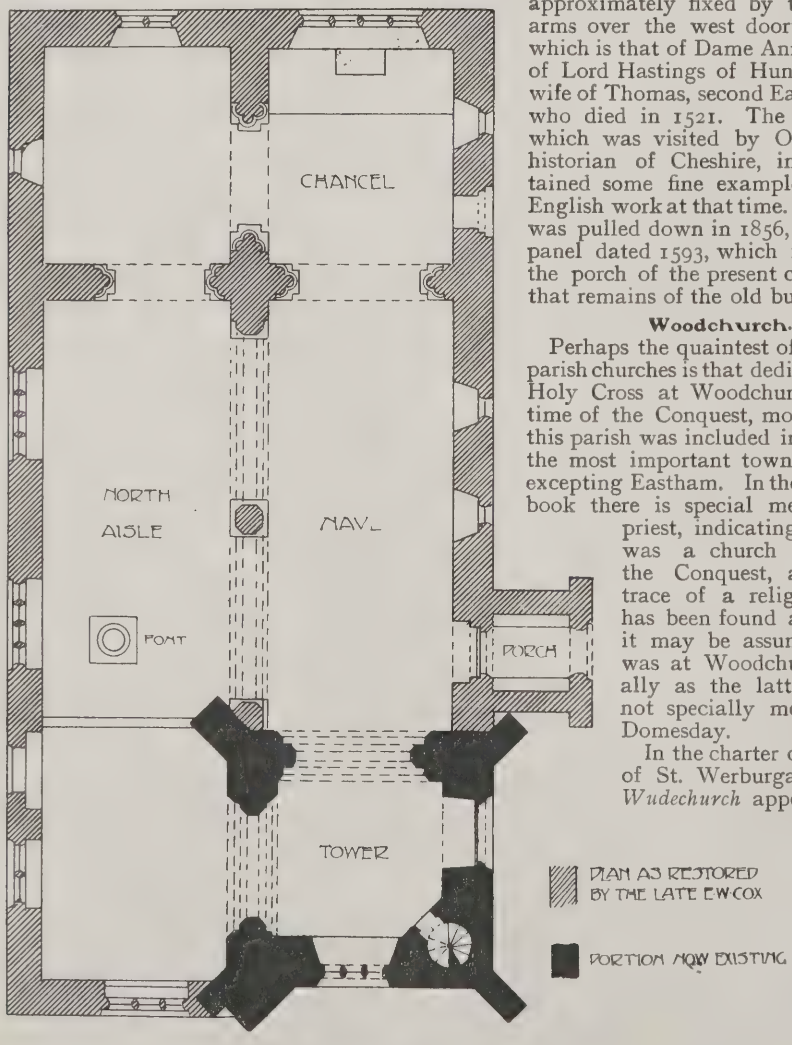
ANCIENT CHURCHES OF WIRRAL.*

By LAURENCE HOBSON, A.R.I.B.A.

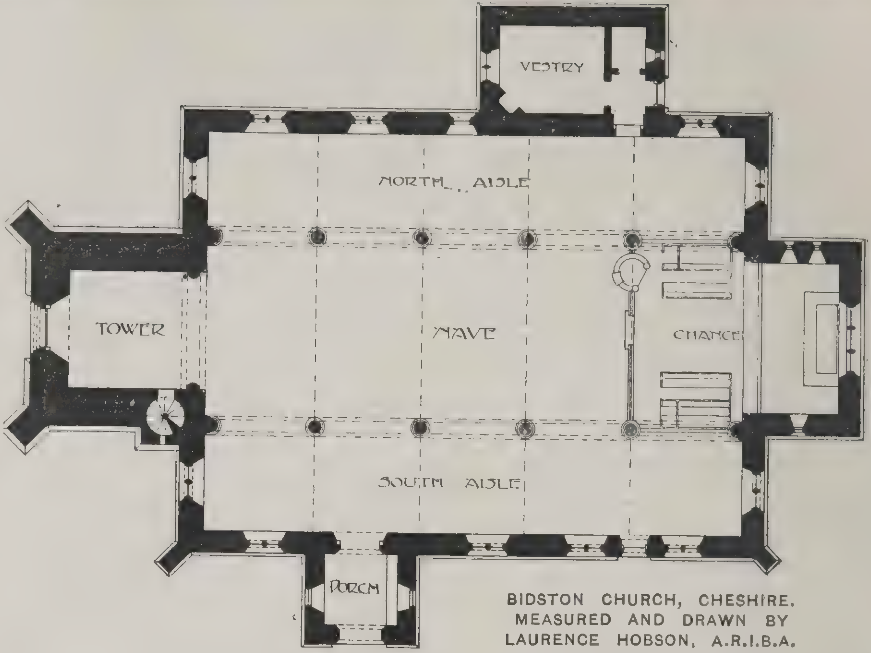
THE Hundred of Wirral is a division of the county of Cheshire which lies between the rivers Mersey and Dee, bounded on the north by the Irish Sea and on the south by the adjoining Hundred of Broxton. Architecturally speaking, the Cheshire churches cannot compare with those of Lincolnshire, Northamptonshire and other counties; but what they lack in architectural grandeur is compensated for, to a great extent, by their quaintness and their archæological and historical interest. Space will not allow of a full and detailed description of each church, and I will therefore confine myself to putting before the reader such facts as appear to me to be the most interesting.

Wallasey.

Of Wallasey Church nothing now remains but the tower, built in the year 1530. The most recent church was burnt down on February 1st, 1857. The old structure was a very plain one with no redeeming features, and was erected about the year 1760 on the site of an earlier church. This earlier building was added to at various times in past ages, the nucleus being the original Norman church, which possibly dated from the reign of Henry I. or Stephen, and was most probably co-eval with the Norman font which, after a very chequered career, is still in existence. When the last erection of 1760 was destroyed, a number of fragments and carved stones of the earlier church were found built into the walls. These the late Mr. E. W. Cox sketched and measured and, with the aid of various old documents, was enabled to restore the plan of the earlier church, which is fully described in a paper given before the Historic Society of Lancashire and Cheshire.



ST. HILLARY'S CHURCH, WALLASEY.



BIDSTON CHURCH, CHESHIRE. MEASURED AND DRAWN BY LAURENCE HOBSON, A.R.I.B.A.

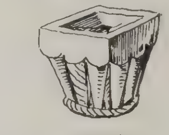
Bidston.

At St. Oswald's, Bidston, the tower, as at Wallasey, is all that is left of the original fabric, the church being quite modern, though following the lines of its predecessor. The tower was built about 1520, the date being approximately fixed by the coats-of-arms over the west doorway, one of which is that of Dame Anne, daughter of Lord Hastings of Hungerford, and wife of Thomas, second Earl of Derby, who died in 1521. The old church, which was visited by Ormerod, the historian of Cheshire, in 1812, contained some fine examples of Early English work at that time. The fabric was pulled down in 1856, and a stone panel dated 1593, which is built into the porch of the present church, is all that remains of the old building.

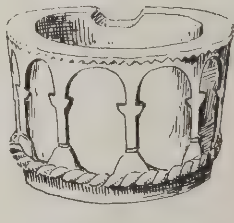
Woodchurch.

Perhaps the quaintest of all the old parish churches is that dedicated to the Holy Cross at Woodchurch. At the time of the Conquest, most probably this parish was included in Landican, the most important town in Wirral, excepting Eastham. In the Domesday book there is special mention of a priest, indicating that there was a church here before the Conquest, and as no trace of a religious house has been found at Landican it may be assumed that it was at Woodchurch, especially as the latter place is not specially mentioned in Domesday.

In the charter of the abbey of St. Werburga the name *Wudechurch* appears as early as 1093, and this would practically confirm the existence of a wooden church on the site of the present one. The building as it now stands consists of a nave, south aisle, chancel and tower, the last being chiefly remarkable for the enormous buttresses which support the angles. The body of the church is of the Decorated period (about the end of the fourteenth century), while the south aisle and porch were added in 1584. The north wall of the nave and chancel forms part of the Norman church, the Perpendicular windows having been inserted. The only Norman window left is a small one on the north side of the chancel. An open-timber roof of plain design was uncovered during a partial restoration in 1844, having been hidden previously by a low ceiling. The tower dates from the fourteenth century, with a later casing, and the buttresses appear to have been added in 1675, as shown by a panel bearing that date. There is an open screen between the nave and chancel, and the ends of the choir stalls are finely carved; they appear to be of the Perpendicular period or possibly late Decorated.



PISCINA



NORMAN FONT

FROM ST. HILLARY'S CHURCH, WALLASEY.

West Kirby.

At West Kirby an important church certainly existed as far back as Saxon times, and was connected with a small Benedictine monastery on the adjacent island of Hilbre. During the restoration of the church in 1870 many sculptured crosses and other stones of the greatest antiquity were found built into the walls, and are now preserved in a museum adjoining the church. The foundations of an earlier and smaller building were also discovered, presumably the original Saxon church, and the bases of two Norman columns were found *in situ*, proving that the original fabric must have been rebuilt shortly after the Conquest. The earliest portion of the church now existing is of the thirteenth century. The chancel contains two sedilia and a piscina, with a priest's door on the south side. All belong to the thirteenth century, and are contemporary with the fine east window, the tracery of which is unique in England, with one exception; the only other exactly similar window being at Shifnal, in Staffordshire.

---

* A paper read before the Liverpool Architectural Society.

Heswall.

On the coast of the Dee is the village of Heswall. Here we find that the only ancient portion of the church remaining is the tower, dating from about 1460—a typical example of a Wirral tower, and, with the exception of the buttresses and ornamented battlements, very similar to the one at Woodchurch.

As the tall graceful spire is characteristic of the Northamptonshire churches, so it may be said the square massive tower is the distinguishing feature of the churches of Wirral.

It is worthy of note that Heswall and Woodchurch were the only two churches in Wirral which were entirely independent of any monastic connection.

Neston.

Continuing along the coast of the Dee, we find again at Neston that the tower is all that is left of the *old* church. It is somewhat earlier than Heswall, and probably dates from the beginning of the fifteenth century. It differs from the other towers in having two lights, one above the other, in the belfry stage. As a priest is alluded to in the Domesday book, a church certainly existed here before the Conquest, and this is confirmed by the fact that a number of ancient carved stones (probably Saxon) were found during the restoration. The original church was supposed to date from about 1150.

Burton.

The church dedicated to St. Nicholas at Burton is an exceedingly plain structure. The present tower, nave, chancel and north nave are comparatively modern, having been erected in 1721, though it is quite possible that some portions of the building may have been recased at that date. It is recorded that a tower was built in 1500 on to the church then existing, but there can be little doubt that it must have been demolished prior to 1721; the stones were probably re-used in the erection of the present tower.

Shotwick.

As already mentioned, Woodchurch has the quaintest church, but Shotwick Church is the most picturesque in its situation. The visitor finds here an old-world village almost undisturbed by modern influence. Away from the busy high road, in this peaceful spot one can readily conjure up visions of by-gone days, when Shotwick Castle was a royal residence and the starting-point for expeditions to Ireland and Wales; but it is difficult to imagine that the village once stood on the very banks of the Dee, for it is now about three miles inland, though the view from the top of the church tower shows where the flat lands have been reclaimed from the sea, what was once a waste of water being now cultivated ground. The present church consists of a nave and chancel, a north aisle and the usual western tower. The nave is divided from the aisle by three octagonal columns with moulded caps, supporting plain chamfered equilateral arches.

In the Chester Cathedral library is the record of the building of a Saxon church, A.D. 900, and this church is referred to in the Domesday book. I think we can still trace in the existing fabric as far back, at any rate, as the Norman church. In the south wall is the original Norman doorway with its three orders of characteristic ornament, and the whole of this wall up to the small break where the chancel begins appears to be of the same date. There is a break in the large internal pier which comes exactly opposite the exterior break, and this most probably defines the extent of the original Norman building; the north wall being along the line of columns. Following the usual custom in country churches, the chancel would next be added, and at the same time, or shortly afterwards, the north wall would be removed and the north aisle erected. Most of the windows appear to have been inserted in older walls, and various additions and alterations made during the fifteenth century. The beams of the south porch unfortunately cut across the Norman arch, which is a matter for regret, as this is the only Norman doorway now remaining in Wirral. The church contains the original high pews, a churchwarden pew with canopy over, dated 1709, and a very interesting old-fashioned three-decker pulpit. The font is very plain, and most likely dates from the Norman period.

Backford.

In an easterly direction from Shotwick is the village of Backford, about three miles

SHOTWICK CHURCH, CHESHIRE.
DRAWN BY LAURENCE HOBSON, A.R.I.B.A.

north of Chester, and close to the main road. The church consists of a tower, nave, north and south aisles, and chancel. The last dates from the thirteenth century. The east window and one on the north side are the original Early English, with a small door on the south side of the same period. The tower is very similar to that at Shotwick, and is either late fifteenth or early sixteenth century; it contains some very good examples of the work of that period. The body of the church as it now stands was built in 1879; the brick walls of the previous structure were found to be in such good condition that they were merely cased outside with stone and the interior plastered. This brick building was erected in 1728, replacing an earlier fabric of which all traces are now lost. In the chancel are two small piscinæ, and the nave contains a very interesting old black-letter Bible in excellent preservation, dated 1617, and chained to the desk in accordance with the ancient custom.

Eastham.

The church dedicated to St. Mary at Eastham was granted to the abbey of St. Werburgh about the year 1152. The only part remaining of the original Norman church is a portion of the north wall of the chancel. Of the present church, which was restored in 1875, the tower and spire are of the Decorated period, the south aisle and chancel being of the same date. The last is lighted by a fine five-light window filled in with reticulated tracery. The nave is divided from the aisles by Early English arcades, and lighted from above by a clearstory. The mouldings of the column caps are very varied in design, and afford good examples of thirteenth-century work. The remainder of the church is of the Perpendicular period, with the exception of some modern additions. The chapel at the end of the north aisle belonged to the Stanleys of Hooton, and contains the family tombs. The font is carved out of a solid block of white stone, and is probably of the same date as the original Norman church.

Lower Bebington.

St. Andrew's, Lower Bebington, is the largest and architecturally the most interesting of the Wirral churches, and contains examples of nearly all phases of mediæval architecture from the time of the Conquest. There is no indication of a church here in Domesday, but a priest is mentioned at Poulton, which was included in the same parish. The nucleus of the present church was of Saxon date, and occupied the position of the present nave. In the Norman period

this earlier church was taken down and enlarged, and a new aisle and chancel added. The Norman columns and south wall still exist, the two small Early Decorated windows having been inserted about 1280.

Just prior to the Reformation, about the year 1515, a great scheme was contemplated for rebuilding the whole church. The work was commenced from the east end, and at the time of the dissolution of the monasteries in 1536, when all ecclesiastical work came to a standstill, the chancel and side aisles only had been completed. Here the work ceased, and was joined on to the old Norman church, the connecting arch having to be "skewed" owing to the new chancel being of a different width to the old nave. It will be seen by reference to the plan on p. 338 that there are four large piers in the centre, which has led some writers to conclude that a central tower was contemplated, but as the western tower, built about the year 1320, would be standing at the time of the rebuilding, it would be hardly likely that the builders would think of erecting a second one. The north aisle was added in 1845, the original windows, door and porch being re-used. The Norman nave arcade is a typical example of the period, and the Perpendicular windows of the chancel, though late in the style, are of good design and detail. There is a small window on the south side of the chancel which is so arranged that on St. Andrew's day the sun shines on a niche which once contained the statue of the patron saint. The font is in excellent preservation, and in all probability is of the same date as the Norman church, though some antiquarians have asserted that it is a veritable relic of Saxon times.

BACKFORD CHURCH, CHESHIRE. MEASURED AND DRAWN BY LAURENCE HOBSON, A.R.I.B.A.

DETAILS OF A HOSPITAL WARD.*

By A. SAXON SNELL, F.R.I.B.A.

THE floor of a ward should be laid on a solid foundation, and the surface should be as impervious as it is possible to make it. Also it should be smooth and free from holes or crevices likely to retain dirt or dust. No one thinks nowadays of using plain jointed soft wood floors.

Modern floors are of several kinds: Hardwood block floors; hardwood tongued boards laid in narrow widths, secret nailed and polished; asphalt; terrazzo; patent composition floors such as Euboeolith, &c. The hardwood floors are most frequently made of oak or teak. Hitherto I have myself adopted kiln-dried maple in very narrow widths. In addition to being an exceedingly hard and unwearable floor, its light colour shows up dust much more easily than dark woods, and this, to my mind, is an important detail. The most usual finishing to wood floors is beeswax and turpentine highly polished. I believe that if this is regularly wiped over with a wet rag, and as regularly polished, it is a very good surface; though no doubt it is desirable to have the surface entirely cleaned off and renewed at intervals. Terrazzo floors I do not think quite so impermeable as they are supposed to be. The main part of the material is cement, and it is well known that both cement and marble chips are fairly absorbent materials. The comparative impermeability of this floor is due to the high polish it receives when first laid, and that is very soon worn off. Asphalt is, no doubt, the most impervious of floor materials, but it is of a dark, uneven and bad colour, and is therefore seldom used.

My experience of patent composition floors has not hitherto been so fortunate as to enable me to commend them highly.

The skirting to the floors should be rounded so as to form a good hollow. The most usual radius is from 2½in. to 3in. Latterly I have used 1¼in. only, which is quite sufficient for its purpose. All that is necessary is to have such an angle as will allow the whole surface to be easily and rapidly cleaned, and prevent stagnation of air. It is best formed of the same material as the floor. There are practically two opposite principles which govern the material of which the wall surfaces should be composed, and these are derived from views on that much vexed subject — ventilation. It is safe, however, to assert that at the present time, for hospital ward walls, at least, impervious walls are mostly in vogue. The use of tiles has no doubt given us a more impervious and even surface over a large area, but it is discounted by the numerous joints. The ideal surface would no doubt be an unbroken and polished surface such as obtains on tiles, affording no ledges for the lodgment of dust; but this has been fairly well achieved by the use of enamel paint upon hard trowelled cement surfaces. It is scarcely possible to obtain a more generally smooth surface than with trowelled cement—Keene's or Sirapite, for instance. These can be brought to a polished surface. There can be no question that ceilings should be non-porous, and they are best painted. As to the best form of window for a hospital ward, there appears to be no general agreement. The most usual is the ordinary sash window with a hopper above opening into the ward, with spandrel sides to prevent down-draught. It would appear, however, that its form and construction involve the many angles, crevices and hidden voids which in other parts of the ward we strive so much to avoid. Casement windows with solid frames are at least not open to this objection. I have used casement windows brought down to within 12in. of the floor, and with hopper next the ceiling. The casements open inwards, and thus form a protection for the bed. It is possible also by opening the windows to their fullest extent to fairly flood the wards with air. At Charing Cross Hospital, I am adopting a form somewhat similar to what I believe is known as the "Middlesex" window, owing to the alleged fact that it was first used at that hospital. There are five sashes of equal size in the height of the window, all of which (excepting the lowest) are hung on centres and controlled by one rod and lever. The sashes close one upon another, and there are therefore no transoms. The lowest sash is separately hung on the bottom rail. It is obvious that a window so constructed can be opened to a much larger extent than is possible with the ordinary sash window. I should add that all except the controlling lever of the opening apparatus is fixed on the outside of the window. If it is possible to fix the glass of the sashes quite flush with the inner surface of the sashes, a great advance will be made. Doors should be made wide enough to allow the passage of a bed. It is desirable that the upper panels should be glazed with clear glass. The material for joinery might be considered here. Hard wood throughout is generally adopted, where the question of cost is not vital—hard wood oiled or French polished. Its comparative freedom from material shrinkage and its harder or less absorbent surface are great advantages. I am hoping in time to obtain what I may call solid joinery, *i.e.*, built up without panels. Of course, it is possible to have solid or flush panels, but shrinkage soon shows up the joints, which then become dust traps impossible to clean. There are some Canadian doors now made of which the principle of construction could, no doubt, be applied. They are made up of quite small sections of wood closely fitted together, and sheathed with hard wood dovetailed on, the whole pressed together by hydraulic pressure. They are made to imitate the ordinary panelled door, but one is being made for me now—as an experiment—of *solid* soft wood, sheathed all round in oak.

---

* Summary of a paper read before the Sanitary Institute Congress on Thursday, July 9th.

In the furniture and fittings of wards, for which the architects are responsible, there is a general falling away from the principles of construction; although I am bound to add that some very notable improvements have been made in late years. Bedside lockers especially call for consideration. The tops are now usually of glass or "Marmorite," and if it were only possible to get rid of the closed cupboards, it would not be difficult to design them generally so that every part could be readily and easily cleaned. The mention of cupboards reminds me that they should be as far as possible banished from the ward. One at least is, of course, necessary for holding surgical and medical appliances, lint, medicines, &c., but this should not be placed or built against the wall. It should stand out in the centre of the ward, and be constructed of hard wood, framed and glazed all round and on top, and fitted with glass shelves. Fixed or heavy tables and chairs are to be avoided. It is quite possible to make a light table rigid.

One or other of the forms of stoves which is built up with plain fire-brick and bricks, or tiles, is preferable. There is a greater amount of heat given out by radiation, and far less by conduction, and there are few lodgments for dust and dirt. It is not the purpose of this paper to deal with such large and controversial subjects as heating and ventilation, or to enter into any discussion upon the relative merits of natural or mechanical ventilation.

It is only necessary to remind you that, whatever pipes or fittings are used, they should be so placed and constructed as to be easily kept clean.

A fixed lavatory basin has been regarded as quite inadmissible in the ward itself, but the inconvenience of hand basins and the great improvement in the construction of fixed lavatories, have combined to overcome the objection to their being in the ward. I should like to refer to the deceptive character of so many sinks and basins in the market. They are beautifully designed to avoid anything in the nature of dirt crevices or mouldings on the surface, but the glazed surface and rounded angles are confined to the top and sides. Underneath they are rough, angular, and full of pockets which are never likely to be cleaned from the day they are fixed.

ST. ANDREW'S CHURCH, LOWER BEBINGTON, CHESHIRE: PLAN. MEASURED AND DRAWN BY CHARLES W. HARRIS.

Keystones.

The Eleventh International Congress of Hygiene will be held this year in Brussels, from September 2nd to the 8th. Doctors, architects, engineers, statisticians and others interested in questions of hygiene are invited to take part in the deliberations.

The Devon and Exeter Architectural Society are shortly to pay a visit to the new Royal Naval College at Dartmouth. The members will be accompanied by Mr. Aston Webb, according to whose designs the college is being built.

Particulars of the A.A. Day Courses in Architecture for the Session 1903-4 have been issued in pamphlet form, and can be obtained at 56, Great Marlborough Street, W. The winter term commences on September 28th.

The "Boardman" Travelling Studentship in Architecture, value £15, has this year been awarded to Mr. George Mobbs, junr., pupil of Mr. Albert C. Havers, architect, Bank Plain, Norwich and Sheringham, for his measured drawing of "The Cloister," Norwich Cathedral.

In the Competition for the best set of designs for a block of first-class business premises proposed to be erected at the corner of the Penrhyn and Conway Roads, Colwyn Bay, the first premium has been awarded to Mr. E. A. Lloyd, of Blackburn, Lancashire, and the second to Mr. D. M. Roberts, of Colwyn Bay.

The Strand Improvement Scheme.—The London County Council has erected on the site of the Strand improvement several lines of scaffold poles, along which have been affixed white bands showing the different lines of frontage proposed. The public can now judge the value of the new proposals, as well as the criticism bestowed on the original design.

A new Reredos at St. Erth Church has been erected entirely of West of England grown oak. It is in the fifteenth-century style of Gothic art, occupying the whole of the space beneath the great east window, and is made from a design by the Rev. R. Medley Fulford, formerly F.R.I.B.A. The work has been carried out by Messrs. Harry Hems & Sons, of Exeter.

The Manchester Society of Architects on July 4th made a sketching visit to Whalley and Mytton Churches and to Stronghurst College, the early Renaissance portion of which provided some interesting material. The rain unfortunately prevented a good attendance at the visit to the new car depôt in Hyde Road. Mr. J. Gibbons, the architect, explained the design and construction of this interesting building, the first part of which is now approaching completion.

A new Presbyterian Church at Builth Wells has just been completed at a cost of £4,500. The style is Perpendicular Gothic, and the walls have been built of the local blue stone with freestone dressings. The school premises comprise a school or lecture hall and nine classrooms, with scullery and lavatory accommodation. Mr. D. W. Richards, Newport (Mon.), was the contractor, and Messrs. Habershon, Fawckner & Groves, Newport and Cardiff, were the architects.

A Memorial to the late Mr. Onslow Ford, R.A., has been erected at the junction of Abbey and St. John's Wood Roads. Mr. J. W. Simpson, the well-known architect, designed the monument and superintended its execution, and Mr. Lucchesi executed the medallion portrait of his master, while the borough laid the necessary foundations. The memorial is in the form of an obelisk. On one side is the medallion portrait already referred to, and on the other is a replica of the Muse at the base of the Shelley Memorial at Oxford.

Leith Poorhouse Competition Designs.—At a meeting of the Leith Parish Council held last week it was decided by eleven votes to six that plan No. 6 be selected for the new poorhouse. The author is Mr. J. M. Johnston, of Leith.

Architects' Registration.—At a meeting held last Thursday the Leeds and Yorkshire Architectural Society expressed itself in favour of the statutory registration of architects; and further expressed the hope that the R.I.B.A. would take early measures to give effect to a principle "which would give our profession a recognized status, and raise the standard of architectural education and training throughout the kingdom."

Clifford's Inn.—On Thursday next, at 12 o'clock, there will be sold by public auction in one lot, at 3, Clifford's Inn, Fleet Street, some rare seventeenth-century woodwork and carving ascribed to Grinling Gibbons. The lot includes a handsomely carved chimney-piece and four doors, the whole of which can be easily removed and refitted. The proceeds of this sale will go towards the funds for the proposed formation of the new School of Law.

The International Society of Sculptors, Painters and Gravers has been invited by the leading American academies and art institutions to exhibit the work of its members in the United States. The society has accepted the invitation, and exhibitions, commencing in October, have been arranged for in the Pennsylvania Academy of the Fine Arts, Philadelphia, the Carnegie Institute, Pittsburg, the Cincinnati Art Gallery and the St. Louis Museum of the Fine Arts during the period of the Exposition in that city.

Nidd Valley Arbitrations.—Lieut.-Colonel W. H. Wellsted, C.E., the umpire, has just issued his award, amounting to £14.585, in respect of 1,415 acres of leasehold land in the Nidd Valley taken for the construction of reservoirs and gathering ground for the Bradford Corporation waterworks. The claim was for £28,220, whilst the value placed upon it by the Corporation witnesses was £7,973. The arbitrators for the claimant and Bradford Corporation were Mr. Thomas Fenwick, C.E., of Leeds, and Mr. Charles Gott, C.E., of Bradford, respectively.

The Campanile of St. Mark.—Signor Beltrami has issued his first report on the results of his investigations of the Campanile of St. Mark, at Venice. From this report it appears that there is no evidence of any damage caused directly by subsidence of the foundation level. A depression in the northerly direction to the extent of 9·5 centimetres was noticed, which depression is in direct connection with the corresponding inclination towards the north which the campanile had for some time been observed to show. The questions now to be solved are whether the base should be enlarged and whether the weight of the new campanile, as compared with the fallen one, should be reduced.

A Church Competition.—In February last a competition for designs for a Baptist church and schools in the High Street, Ilford, was held. The design by Messrs. George Baines, F.R.I.B.A., and R. Palmer Baines, architects, 5, Clement's Inn, Strand, London, W.C., has been selected. Circumstances have transpired since the competition was promoted which prevent the committee from proceeding at once to build, and the matter is therefore postponed for the present. The selected design provides for a church, to seat about 860 adults, with the usual vestries, &c, and a school, with large central hall, having many classrooms opening into it, divided by swivel partitions. Seniors' and infants' classrooms, kitchen, &c., are all on the most recent model plan. The whole scheme is estimated to cost upwards of £8,000. The style is Perpendicular. The buildings would be faced with red bricks, with Bath-stone dressings.

Opening of Stonehaven Bay Hotel.—A new hotel at Stonehaven has been erected from designs by Mr. Marshall Mackenzie, A.R.S.A., of Aberdeen. The work has been carried out by the following contractors, under the superintendence of Mr. William Rattray, clerk of works, Aberdeen:—Mason, Pringle & Slessor, Aberdeen; joiner, Clark & Donaldson, Aberdeen; plumber, Blaikie & Sons, Aberdeen; electrical work, The Electrical Engineering Co., Aberdeen; slater, Mr. Farquhar, Aberdeen; plaster, Valentine & Son, Stonehaven; painter, Murray & Mitchell, Aberdeen.

The Passmore Edwards Polytechnic, Peckham Road, Camberwell, which is now in course of erection, occupies a site adjoining the South London Art Galleries. which will form part of the large block. The site was purchased by the Camberwell Borough Council, and Mr. Passmore Edwards (who also gave the Lord Leighton memorial building adjoining the new wing) is largely contributing towards the cost of the substantial structure which is being put upon it. Large and amply-lighted workshops will be provided for technical trades, such as masons, bricklayers and brickworkers, carpenters and joiners, plumbers and metalworkers, bookbinders, painters and decorators. There will also be a large room devoted to building construction. The buildings will be fire-resisting, with concrete staircases, and the whole of the workshops will be lined with glazed bricks.

South-western Polytechnic.—The lectures on architectural history given by Mr. Banister Fletcher A.R.I.B.A., and arranged under the auspices of the Board to promote the extension of university teaching of the University of London, held during the past session have been very successful. Sixty-three students entered for the course, and at the examination held at the conclusion eleven students satisfied the examiner (Prof. W. R. Lethaby, of the Royal College of Art), and six of these qualified by examination for the sessional certificate in honours. The successful students are:—Frank L. Atwell, Arthur E. Colman, Albert T. J. Harris,* John L. Howland, Frederick G. Pain,* Albert A. Reeve, Gerald G. Rogers, Charles J. Smith,* Ada M. Warren,* Emily M. B. Warren* and Earnest A. Weston.* (Those marked with an asterisk qualified for the certificate in honours.) For the coming session, which opens at the Chelsea Polytechnic on Monday, October 5th, at 7 p.m., visits are being arranged to important buildings and museums around London.

Proposed Rebuilding of Lambeth Bridge.—The Bridges Committee will shortly bring before the London County Council for its approval a proposal that application should be made to Parliament in the next session for powers to rebuild Lambeth Bridge. The question of the gradients practically decides whether it is to be built of steel or masonry. At present the gradients are very steep, being from 1 in 19 to 1 in 22 on the north and from 1 in 20 to 1 in 23 on the south. A masonry structure could not be built with a better gradient than 1 in 25, which is about the same as the northern approach to Southwark Bridge, and that, on account of its steepness, is little used for vehicular traffic going southwards. On the other hand with a steel bridge a gradient of 1 in 30 can be obtained and better facilities for navigation afforded during construction than has been the case at the new Vauxhall Bridge. The committee therefore recommend the construction of a steel bridge, which is to have a width of 60ft. The estimated gross cost is stated to be £872,000, of which the cost of the acquisition of property necessary to provide adequate approaches amounts to £410,000. The actual cost of the construction of the bridge is set down at £330,000.

UNDERGROUND WATER SUPPLIES.*

By **WILLIAM H. MAXWELL, A.M.I.C.E.,**
Borough and Waterworks Engineer,
Tunbridge Wells Corporation.

THE recent years of drought have been the means of directing greater attention to the subject of water supply from underground sources, and the increased conservation of these supplies indicates how fully the importance of this question is now appreciated. Many parts of England, and the south-eastern counties in particular, do not possess anything approaching those ideal surface-gathering grounds of Wales and the North, and other means of supply have therefore to be sought, such as the abstraction of water from underground after it has penetrated varying depths through strata of different kinds. One of the principal of such water-bearing rocks is the chalk, which, as if by a wise provision of nature, occupies that part of the country where other sources are scarce.

The utilisation of underground supplies is of the greatest interest to waterworks engineers, but I regret, owing to the very limited leisure at my disposal, that I have not found it possible to do more than offer the following few general remarks thereon, which I hope, however, may serve to introduce some of the principal questions bearing upon this subject for discussion by those present.

Geological Information Available.

In his search for underground water the engineer is brought into close practical contact with the subject of the geological structure of the district in which he proposes sinking for a supply, and the importance of detailed information under this head will be well known to all present. Such information, however, in the detailed form often required by the water engineer, is not always available, although, as all are aware, a great deal may be derived from the 1in. maps of the Geological Survey, and further local details from the M.S. maps on the 6in. scale supplied by the Geological Survey Office for those parts of the country which have been so revised.

I was much gratified a few years ago to find that the data thus available is now being largely supplemented, in what appeared to me to be a most valuable form for the purposes of the waterworks engineer, by the publication by the Geological Survey Office of a series of "memoirs" dealing with the underground waters of the different counties. Two of such memoirs have so far been published, the first (1899) dealing with the "Water Supply of Sussex from Underground Sources," and the second with that of Berkshire. The memoirs give details of a large number of well-sections throughout the county, with particulars of the quantity and quality of water obtainable therefrom, and other local geological information affecting water supply.

Quality of Underground Water.

The quality of water obtainable from underground sources in any locality depends upon the chemical character of the material or strata through which it has percolated, and its quantity will depend on the hydrogeological structure of the district. The value of underground supplies for waterworks purposes has long been appreciated. In the sixth report (1874) of the Rivers Pollution Commission we find deep-well waters described as being "almost always bright, sparkling, palatable and wholesome"; the same report also continues to the effect that "their uniformity of temperature throughout the year renders them cool and refreshing in summer, and prevents them from freezing readily in winter. Such waters are of inestimable value to communities, and their conservation and utilisation are worthy of the greatest efforts of those who have the public health under their charge."

Water-Bearing Strata.

Some of the principal water-bearing strata, named in geological order commencing with the most recent, from which supplies have been obtained are: Valley gravels and drift deposits, Bagshot beds, Reading beds, Thanet sands, chalk, green sand, Ashdown sand, oolite, new red sandstone, millstone grit.

The water from the surface gravels is of doubtful quality, being obtained from shallow wells and more or less liable to pollution; it should be distinguished from deep-wall waters obtained by wells or borings into water-bearing strata situated beneath or between impermeable beds, such, for example, as the water obtained by boring through the Tertiary formations into the chalk below in the London basin, or that obtained from the Ashdown sand lying beneath an impermeable bed of Wadhurst clay, where varying amounts of artesian head are met with.

Conditions determining the Quantity of Water obtainable.

The quantity of water which may be abstracted by means of wells or borings from any contributing underground area will depend upon a variety of circumstances, determinable to varying degrees of exactness, among which the following conditions may be enumerated:—

(1) The boundaries or extent of the underground contributing area or watershed.

(2) The area of "outcrop" of the water-bearing strata, and the extent to which the slope of adjoining impervious areas may conduct the rainfall falling thereon on to the porous "outcrop."

(3) The annual rainfall over the contributing area, and the proportion thereof percolating annually in at the outcrop, and ultimately finding its way to the underground store.

(4) The degree of porosity or permeability of the water-bearing strata.

(5) The quantity of water, or leakage, flowing out of the underground store, through natural outlets, as for example into the sea, or beds of rivers.

(6) The percentage of the total percolation into a water-bearing strata which is again recoverable by means of pumping stations.

To define with a reasonable degree of certainty the true contributing area is by no means an easy matter, and must always involve a close geological and physical examination of the country in the neighbourhood of the outcrop.

Rainfall and Percolation.

With the records now available, the rainfall will usually be readily obtainable, but the question of the amount of "percolation" is a point involving considerable difficulty and uncertainty. The subject of "percolation" is of itself a large and interesting one, and among other things depends on:—

(1) The manner in which the rainfall reaches the ground, whether in numerous slight showers or in heavy rains.

(2) The time of the year when the greatest rainfall occurs.

(3) The surface slope of the ground and the dip of the underlying strata.

(4) The nature of the soil or strata; its degree of porosity or permeability.

There is much difference of opinion as to the ratio existing between the *percolation* and *rainfall* in different classes of soil or strata, and the question is one upon which further observations and experiments are needed. In the case of the chalk, after considering all the available facts, the Royal Commission on the Water Supply of the Metropolis (1892) adopted the figure of 7in. of percolation as an average among ordinary years' rainfall over the chalk area within the Thames basin, while during a succession of dry years this, it is stated, may not amount to more than 4in. per annum. On the other hand, observations of the amount of water given off by a certain area of chalk have shown the percolation to amount to as much as 10in. per annum.

Depletion of Underground Supplies.

Another important question is that of the gradual permanent depletion of underground supplies, as distinguished from mere local and seasonal changes of water-levels depending on the fluctuations of the rainfall. A good deal has for many years been heard of the depletion of the store of water in the chalk in the London basin and in the surrounding country districts, through the extensive pumping operations of the London water companies and the numerous private supplies also now drawn therefrom. The effects of these operations, it is alleged, are shown by the reduction of the water-levels in wells and boreholes, by the reduction in the yield of springs and the drying up of river-heads, watercress-beds, &c., and a decline in the volume of rivers in the country around London.

It is, of course, clear that if more water is abstracted from any given area than percolates into it the level will be lowered within that area so long as such abstraction continues. This is illustrated by the excessive pumping from under London, where it would appear that water is being abstracted faster than it can pass through the highly-compressed chalk, thus maintaining a permanently low level of the plane of saturation, and affecting the slope of the underground water outwards from that centre.

The radius within which extensive pumping operations affect underground water-levels in different strata, and the influence of the same upon surface springs, river-heads, &c., in the country around the site of pumping are matters of first importance, and upon which continued observations over long periods are necessary before reliable data can be established. In considering the effects of pumping on the water-levels in any underground area difficulties arise in discriminating with certainty between what is attributable to seasonal changes or variations of rainfall and what may be regarded as permanent depletion of the area through pumping operations being in excess of the average percolation at the "outcrop."

The conservation of Kentish waters has received a good deal of attention of recent years, and the drying up of a well-known stream—the Cray river—alleged to have been largely due to extensive pumping of underground water by a London water company, led to the formation of "The Underground Water Preservation Association," in 1902, for the purpose of preventing the excessive abstraction of water, and conserving the same for the use of inhabitants in the immediate district concerned. To what extent these objects can be achieved, in view of the present state of the law of underground water, as settled in 1859 by the case of *Chasemore* v. *Richards*,* and followed in subsequent decisions, I will not venture to predict.

Types of Pumping Machinery and Motive Power for Deep-well Supplies.

The question of the best type of pumping plant for deep wells or borings is one which depends largely on the circumstances of the case to be dealt with. For borings, the principal alternatives are:—

---

* A paper read before a meeting of waterworks engineers and others held on June 19th last at the Agricultural Hall, Islington, in connection with the Building Trades' Exhibition.

* House of Lords Cases, 349.

(1) Ordinary single-acting deep-well pumps.

(2) Double-acting or concertina type of pumps.

(3) Raising by compressed air.

Where the well or boring is situated at the main pumping station, the question of motive power is frequently readily solved by the use of steam from an existing boiler-house, but where the site is isolated the comparative advantages and disadvantages of the various available alternatives must be considered, such as, for example, the use of:—

(1) A steam pumping plant.
(2) A coal gas-engine plant.
(3) Dowson gas plant.
(4) Oil engines.
(5) Compressed air supplied from a distant station.
(6) Electric power.

Cost of Underground Water.

The cost, under ordinary circumstances, of procuring an underground supply, including payment of capital charges on works and working expenses, will in all probability be from about 3d. to 4d. per 1,000 gallons delivered through a 100 ft. lift to the surface, if the plant is used to its full working capacity.

Law Cases.

District Surveyors and Temporary Buildings.—Messrs. W. Densham & Sons, builders, of St. John's Wood, N.W., were summoned at the Westminster Police Court recently by Mr. Dru Drury, district surveyor for Westminster, for beginning a work before sending a building notice as required by section 145 of the London Building Act, 1894. The structure in question was a sort of block of seats put up in Westminster Cathedral for the purpose of the production of a piece, "The Dream of Gerontius," at the beginning of last month. The section of the Act laid it down that where a building or structure was about to be begun the builder was to serve a notice on the district surveyor before he commenced the work, and the Act also provided for a penalty if he failed to serve that notice. In the present case notice had not been served, and, briefly, the question for his worship was whether a builder could get out of the obligation to serve a notice because he had put up a structure inside instead of outside a building. Mr. Horace Smith, after looking at the case of *Venner* v. *M'Donnell*, where it was decided that the seats at the Agricultural Hall were a part of the equipment of the building, cited by counsel, said he thought he was bound by it. He regarded the present case as indistinguishable from the other. The summons would therefore be dismissed.

Submitting Plans to District Surveyors.—A test case of importance under the Gosport building by-laws was decided by the Gosport magistrates recently. Mr. Henry Daniells, builder, was summoned by the district council for building houses in Burnett Road without depositing plans. Briefly, the facts were that plans for two houses were approved by the council, and subsequently Mr. Daniels decided to continue the row with six more houses of a similar design. Of this decision he advised the council by depositing block plans, with the intimation that they would be according to the plans previously deposited and approved. He then proceeded to build. On his behalf it was argued that this complied with the by-laws, but Mr. Palmer (clerk to the council) said that complete plans, showing all details and sections, should have been deposited with the council for approval.—The chairman, Admiral Field, said that he agreed with the view taken by the defendant.—Mr. W. H. Fry, a former surveyor to the council, contended that the council had no right to keep plans, and that, had the surveyor to the council handed to him the plans of the first pair of houses, so that he could have annexed the notice and the block plans of the additional houses to them, that would have been sufficient. He never objected to that course while in the office.—The Chairman stated that it was a storm in a teacup, but the magistrates had to uphold the district council in their interpretation of the by-laws, and fined defendant 1s. and the costs, 9s.

PUBLIC HEALTH CONGRESS.

THE Annual Congress of the Royal Institute of Public Health was opened on Tuesday, July 14th, at Liverpool. The president, the Earl of Derby, in his opening address said in these days an increased duty was laid on them by the tendency of the population to congregate in towns. He was not going to deplore that tendency. The point was to provide better conditions for them wherever they were. Contrary to the general opinion, contrary to statistics, he doubted the halo of healthiness thrown over the country. No doubt country life appeared ideal, but if they followed it out in detail in times gone by they would find that life in the best cottages was infinitely inferior to anything in the worst slums of the towns now. It was not the case—they knew it painfully—that water was better than in the towns or more abundant. Building regulations were doing much, and might do more, but there was a time when any hovel or hut sufficed for the peasant, though no better than the dwelling of the savage, and fulfilling no single condition of present-day sanitary requirements. On this question of town and country much could be said—at least, he thought much could be said—on both sides; that where towns were bad, the country was far behind them. To his mind the great redeeming point of the country was that there was light and air. Those two attributes were of the most important assistance to the cause of sanitation. Old towns with narrow streets and alleys that excluded air had had their day. They now found that municipalities were conscious of their duties, and were actuated by a desire to bring better conditions of health, light, life and space into the towns they administered. The questions of open spaces, good drainage and good water were of paramount importance. Corporations should not stretch their powers too far. Lord Derby then made the presentation of the Harben Medals for the years 1901 and 1902 to Sir Charles A. Cameron, C.B., M.D., F.R.C.P. Ireland, and Prof. William R. Smith, M.D., D.Sc.

The Housing Question.

The section dealing with the questions of rehousing of the dispossessed and the sanitation of congested areas met on Wednesday, under the presidency of Mr. Austin Taylor, M.P.

The President said the housing question was one of the most important with which that section or, indeed, the whole congress had to deal. It was a problem still in its initial stage, the evils recognised, but the remedies yet to be discovered. Generally, much time was occupied in depicting the evils and difficulties, and not so much in the suggestion of practical remedies. In all cases where municipalities who had to deal with congested districts the work should be mapped out in advance, for at present enormous waste took place through lack of a settled plan and want of cohesion between corporation departments. In practice, the dispossessed tenants of slums did not, as a rule, occupy the new houses, firstly, because the rents were too high; and, secondly, because demolition frequently took place before the new property was erected. It was highly important that slum dwellers, when not a criminal class, should be induced to go to the new houses by means of low-rented places provided in advance.

Dr. James Niven, medical officer of health for Manchester, then read a paper on "Re-housing the Poor on the Outskirts of Large Cities." A great impulse had already been given to the movement outward by the development of electric trams, enabling people to live at some distance from their work, but it would still remain necessary to make provision of sanitary dwellings for a large number of persons obliged to live near the centre, and the scheme of the Liverpool Corporation in this direction, he thought, was bold and judicious.

Dr. J. Spottiswoode Cameron, medical officer of health for Leeds, contributed a paper on "Methods of Dealing with Unhealthy Areas." He said a most important scheme was being attempted in Leeds About 75 acres of land covered with houses and other property were scheduled by him in 1895. The Corporation resolved to deal with it in detail, and while adopting the representation as a whole, proceeded to form a scheme for about 16 acres. Powers were obtained after a hard fight.

Mr. T. T. Turton, deputy-surveyor, Liverpool, read a paper on "The Housing of the Dispossessed," in the course of which he gave a historical resumé of the Liverpool scheme. Since 1864 there had been 8,000 houses demolished under the Act, and about 4,000 for trade and other purposes, and there were 9,900 houses still to be dealt with. Up to the present the cost of demolition had been £400,000. For many years the displacement of population was not felt, but in 1899 it was found that from 1885 up to that year only half the dispossessed had been accommodated, and there was a deficiency of 3,056, although the houses built included 125 tenements at St. Martin's Cottages, Victoria dwellings 270, and Juvenal dwellings 101 tenements. The deficiency had now been nearly made up. There were in course of construction 176 one-roomed houses (2s. a week), 642 two-roomed (3s.), 738 three-roomed (4s.), and 140 four-roomed (5s.); a total of 4,234 rooms, to accommodate over 8,000 persons. Taking the total cost of demolition and housing, he said the loss last year amounted to 1s. 3d in the £, including sinking funds.

Mr. S. Reeves, Liverpool, said they had agreed to spend about £1,000,000 on the house schemes, and, after ten years, there were now fewer habitable houses than there were then. So long as the council went on buying insanitary property at big prices, instead of leaving them to be closed under the Public Health Act, this condition of things would continue

Baillie Brown, Edinburgh, said in Edinburgh they did not go to the Local Government Board, who, in England and Ireland, were impeding progress. But they bought a lot of property at five years' rental. They built new houses at 5d. a cubic foot, and were able to provide houses at low rents for the very poor.

Infectious Diseases Hospitals.

On Friday Mr. Shelmerdine, city surveyor, Liverpool, read a paper on "Emergency Hospital Construction and Accommodation." He described in detail a wooden emergency hospital for the accommodation of forty-two patients. The plan consisted of two long wards, 124ft. by 26ft., twenty beds in each, with sanitary annexes. Between these wards was the administration block, an inner hall (entered through a vestibule) from which opened the nurses' duty-room, which also served as hospital kitchen. On each side of the duty-room was a small isolation ward with one bed. Observation windows overlooking all four wards from the duty-room were provided. The floor space allowed was 156 sq. ft. for each patient, and the air space 2,000 cub. ft. The axes of the pavilions were north and south in order to give the maximum of light and air. The walls were covered outside with asbestos canvas, and inside with asbestos sheets; the roof was also covered internally with asbestos sheeting. This building could be erected in twenty-seven days, but the pavilions were as comfortable as those of permanent hospitals, and the structure had a life of about thirty years.

Professor W. J. Simpson, M.D., F.R.C.P. (London), contributed to the discussion a paper on "Infectious Hospitals and Return Cases." He said there was no objection to the aggregation of patients in one building; the objection was to their aggregation and treatment in wards; and he proceeded to argue from statistics that the proportion of return cases under such a system must of necessity be unsatisfactory. He contended that the separate cubicle system was the most consonant with rapid and complete recovery, and that it must be the system of the future for these cases.

Dr. T. W. N. Barlow (medical officer of health, Bootle) contributed a paper on "Requirements in regard to Underground Bakehouses." He said that quite lately the Home Secretary had declared that it was the deliberate intention of the Government to close underground bakehouses, and he had refused to consider the question of compensation. The requirements not involving structural alterations were: — Smoothness of walls and ceilings; provision of wash-basin and clothes' rack outside the bakehouse; no coal nor flour, nor anything likely to cause dust, to be stored in the bakehouse; provision of castors for furniture, and absolute cleanliness everywhere; efficient lighting; back cellar (when there was one) to be made as clean and light as the bakehouse itself.

Engineering Section.

At the last meeting of the Engineering section, under the presidency of Professor Hele Shaw, a paper was submitted by Mr. T. Molyneux, of Liverpool, on the subject of "Mechanical Road Vehicles for Public Works." The speaker pointed out that the more extensive use of motors would tend to greater cleanliness. He alluded to the influence of the Liverpool Self-Propelled Traffic Association in advancing motor carrying. The Corporation of Liverpool had seven heavy motor vehicles in use. The first was obtained in the early part of 1899. The vehicle was designed to carry four tons under the three-ton tare limit. The boiler is vertical, and burns ordinary paraffin to generate steam, this driving a pair of vertical engines, the transmission being by chain through reduction gear. The cost of working was about 8d. per ton per mile on the average. This vehicle is now doing valuable work in street watering in the summer, a considerable saving over horse haulage being shown; and apparatus is fitted for street gravelling in the winter. For refuse collecting and loading it would be found advantageous to group motors and to concentrate as many men as possible for loading purposes.

Construction of Carriageways.

Mr. F. E. Cooper, assistant city engineer, Liverpool, read a paper on the "Construction and Maintenance of Carriageways." He pointed out that the various classes of paving differed only a little from what had existed for many years in Liverpool; but in one or two respects modifications had been introduced. Concrete foundations were composed of crushed clinker, instead of fine gravel and broken stone, which gave expediency, economy and solidity. The system of grouting the joints was also changed by adding to the prepared pitch and creosote oil hot sand or fine gravel at a temperature of about 300 degs. Fahr. Experiments were still being made, the results of which were encouraging. With regard to macadam roads, asphalt macadam was again being largely used, and it was very strong and lasted as long as there was stone left in it. In the wood-paving there was a tendency to "rise," but the arrangement of counteracting this "creeping up" had met with considerable success. Among other classes of paving which were doing good work were compressed asphalt, mastic asphalt, sanitary paving blocks and basalt paving blocks.

Correspondence.

Buildings to Measure around Kendal.

To the Editor of THE BUILDERS' JOURNAL.

LEEDS.

SIR.—On page 311 of your issue for July 8th, I notice a reply to an enquiry *re* buildings to measure around Kendal which is scarcely correct. Knowing the district extremely well I should like to give fuller information. Kendal parish church is a magnificent example of a plain Perpendicular church, having five aisles, and with one exception is said to be the widest in England; inside are three chapels divided from the church by good oak screens, one of which I myself measured and sent in for my own intermediate examination R.I.B.A. One chapel contains the monuments of the Parrs, the the family to which Catherine Parr belonged, and another belongs to the Stricklands of Sizergh Castle, a few miles distant, and well worth a visit. Levens Hall (Heversham Station), 5 or 6 miles from Kendal, is very well known, and should provide many subjects, some of the Renaissance woodwork being extremely fine. It is, I believe, open on Thursdays, but the owner might be written to (Major Bagot, M.P.) for fuller permission. Should your correspondent be a cyclist he can visit the above en route for Cartmel Priory, about 1½ miles from Grange Station (cheap tickets from Kendal), or about 12 or 15 miles by road via Levens and Lindale. Here is any amount of magnificent Norman, Decorated and Perpendicular work, and the choir screen and stalls have far more than local fame and would be a splendid subject for the R.I.B.A.—Yours truly,

H. E. ILLINGWORTH, A.R.I.B.A.

Obituary.

Mr. Thomas Gregg, aged seventy-three, builder, of 57, Handbridge, Chester, died recently.

Mr. Richard Burton, of Aucuba Lodge, St. Giles, Norwich, died last week at the age of sixty-nine years. Deceased was formerly builder to Messrs. Youngs, Crawshay & Youngs, brewers, and of late years had been living in retirement.

The late James A. McNeill Whistler married the widow of Mr. E. W. Godwin, the noted architect. Whistler devoted himself almost entirely to the graphic arts, but as a draughtsman of architecture his loss will be deeply felt by every lover of architecture.

Sir John Hutton, of 7, Kensington Court, part proprietor of the "A B C Railway Guide" and "Sporting Life," formerly editor and proprietor of the "Weekly Times," and for three years Chairman of the London County Council, of which he was one of the original members, who died on the 31st May last, left an estate of the gross value of £52,350, with nett personalty £34,251. Among other legacies, Sir John Hutton left one of £200 to Mr. Allan O. Collard, architect, of Buckingham Street, W.C., who was for some years in the employ of the London County Council in the Architects Department.

INSTITUTE OF SANITARY ENGINEERS.

THE provincial summer meeting of the Institute of Sanitary Engineers was held last week in Wolverhampton and extended over three days.

On Tuesday morning the Mayor of Wolverhampton (Alderman G. R. Thorne) welcomed the members in the council chamber. After preliminary remarks Mr. W. J. Dibdin, F.I.C., F.C.S., &c., president of the Institute, read a paper on "The Theory and Practice of Filtration."

Filtration of Water.

Mr. Dibdin, in tracing the history of filtration, said: The first scientific and practical method of treating hard waters especially is that of Dr. Thomas Clark, who in 1841 patented his famous method of softening water by adding lime water to the hard water in sufficient quantity to absorb the carbonic acid which holds the carbonate of lime in solution. As soon as the excess of acid is thus removed, the lime in the water, as well as that put in and now combined with the carbonic acid, settles to the bottom of the containing vessels, and in doing so carries with it practically the whole of the impurities in the water. The process is one of the most simple and beautiful methods of treating water which has been brought before the public.

It is often claimed for filters that they will remove living organisms as well as the ordinary impurities. Up to a certain extent this is true, but by no means entirely so, more especially in relation to the bacteria. When we consider the conditions of the case we shall understand better how a filter will, under suitable circumstances, allow organisms of various sizes to pass through, and, in fact, to live and multiply in it, with the result that after a time such a filter may become a perfect aquarium in itself.

In reply to Mr. Peers, who said he did not think there was that necessity for domestic filtration in the provinces that existed in London, Mr. Dibdin recommended the high-pressure supply. Years ago he remembered the dreadful state into which cisterns got, no matter how pure the source from which the water originally came. It was no uncommon thing to find rotten boots and dead dogs in the cisterns, and in one case a dead man even was found in a cistern. It was this horrible state of things that brought about reform.

Treatment of Sewage.

On Wednesday Mr. J. Ashton, of the Hacken Sewage Works, Bolton, read a paper on "The Collection and Utilisation of Excreta in relation to Sewage Treatment." He contended that the water-carriage system embodied a huge national waste. By hurrying fixed nitrogen down the drains and watercourses to the sea a loss of no less than £16,000,000 per annum was sustained. Mr. Berrington opened the discussion on the subject, and said he was totally opposed to the views of Mr Ashton. He contended that the pan system was the most extravagant and insanitary that had ever been introduced into a civilised country. The theories set forth in the paper were impracticable in a crowded town. In his opinion, the introduction of the water-carrying system had reduced illness and the death-rate. Mr. S. Lloyd was convinced that the pail system was a vile one. He would like to see it abolished in Wolverhampton. Mr. Peers (chief sanitary inspector for the borough) expressed his surprise that any man should desire the continuance of so foul a system as had been suggested. In reply to the criticism Mr. Ashton explained that his remarks were intended to apply not to large centres of population but to small towns and country places.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Cost of Factory.

LEEDS.—C. P. G. writes: "What would be the approximate cost of a brick factory three storeys high, having a frontage of 38ft., depth 30ft., and lighted on both sides of the 38ft., built with iron or steel girders; the building to be well lighted, leaving as much room as possible for windows, and with an 11ft. projection on the ground floor built of glass and iron (frame) similar to a 'lean-to' greenhouse?"

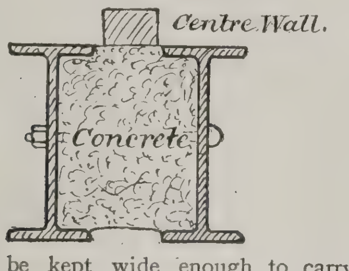
The total height of the factory or of the three storeys required is not mentioned. The cost depends considerably on local conditions, such as the foundations which may be necessary, nature of the design, and other similar items. Under ordinary circumstances a factory of a plain character, without machinery and fittings, will cost from 5d. to 6½d. per foot cube, but cotton factories in Lancashire have been erected from 4d. per foot cube. A glass structure 38ft. long and 11ft. wide, similar to a lean-to greenhouse, with brick base, upright side lights, movable upper lights, concrete floor, &c, will cost from £100 to £160 according to the height of the structure and description of the finishings.

T. E. C.

Carrying Wall and Chimney Breasts on an Upper Floor

HULL.—STUDENT writes: "Please show the best method of carrying wall and chimney breasts on an upper floor when the wall and fireplace below are removed."

From the sketch sent (not reproduced) you appear to contemplate a somewhat risky treatment of a half-brick wall. If the bricks are good and the mortar and bonding good it may be done, but not in the way you suggest. I would advise two girders placed side by side, tied together with a couple of bolts (spaced to divide the length into three parts) and filled between with concrete, as shown in the accompanying sketch. These may be kept wide enough to carry the breasts. You will need to be very careful about shoring and supporting while getting in the girders: you should carefully calculate the weight and see that it is properly distributed on the wall where the girders bear, and that it is also properly distributed on the foundation. You should not expect an existing wall to bear every additional weight that may be put upon it. In a work of a similar kind which I am just doing I find it necessary to put channel irons, for pillars, against the walls at the bearings of the beams: and these pillars rest on short pieces of girder which distribute the load on blocks of concrete specially put down as foundations.



P.

Schools.

MIDLANDS.—IGNORAMUS writes: "In planning an elementary mixed school for 300 boys and 300 girls with a central hall, should the hall be made large enough to hold 600 or only 300? The 'rules' published by the Education Department are not very clear on this point, although they state that the hall is to be for the joint use at separate times. Also, in an infants' school for 400 what should be the proportion of the babies' accommodation? Is there any fixed proportion, such as a quarter or a fifth? Nothing is said in the rules as to this."

Assuming that the school is to be planned on one floor, the accommodation named would at least require ten classrooms, sixty in each. The Board of Education do not lay down as an essential that a central hall shall be provided, but it is now general to plan all schools with one. In this case I do not see that the school could be arranged in an economical working manner with a hall of less dimensions than, say, 75ft. by 30ft. This would allow all the children to assemble at one time. I have always planned my schools with the idea that the hall, when a school is not more than one storey high, should be large enough to accommodate the whole of the children, and always read the rules of the authorities as meaning this. There is no fixed proportion for babies' accommodation in infants' schools. In poor districts parents often send their children to school at a very early age, leaving themselves free for their day's work. A higher proportion would therefore be required in such a case than in a better class district. It has been my practice to provide in schools of 500 infants two babies' rooms, each holding fifty, giving a proportion of one-fifth.

S. J.

Borings for Water-supply in Sussex.

BRIGHTON.—RUTHRA writes: "A boring for water to a depth of more than 160ft. was made some years ago at a certain house in Sussex, but was at that point abandoned. Advice says that water might have been obtained at a lower depth. The stratum is Wealden clay, and the site is very near a river. Does any book give general information bearing on the subject, and can any opinion be formed of the possibilities or probabilities in this particular case other than by applying to various boring firms, whose advice, though cautious, might possibly be a little affected by their interests?"

The most useful information on the subject of underground water in Sussex will be found in a "Memoir" of the Geological Survey Office, entitled "The Water Supply of Sussex from Underground Sources" (price 3s.), wherein are given details of a number of borings in Sussex and the approximate yield therefrom. If such details can be obtained of an existing boring in the immediate neighbourhood of the site in question, this will afford the most reliable data upon which to form an opinion in reference to the present case. It is impossible, in the absence of information from existing borings as to the thickness of the Weald clay at this site, to give any idea of the depth at which the Hastings beds would be reached. Of these, the Tunbridge Wells sands and the Ashdown sands usually contain a limited supply of water of a more or less chalybeate nature. The geological order of succession of the beds and the probable maximum thickness is as follows:—

	Feet.
Weald clay - - -	1,000
Tunbridge Wells sand -	140 to 380
Wadhurst clay - - -	120 to 180
Ashdown sand - - -	400 to 500

It is very probable that water would be found in the Tunbridge Wells sands, but the yield is not likely to be large. We recommend a careful perusal of the publication above-named, and also the paper on the subject of "Underground Water Supplies" recently read by Mr. W. H. Maxwell, A.M.I.C.E., before a meeting of waterworks engineers at the Agricultural Hall, Islington (published on p. 340 of this issue).

Keeping Street in Repair.

BANGOR.—W. G. W. writes: "The Corporation have recently adopted the Private Streets Improvement Act, and have now sent notices to the owners of a certain street to put it in repair according to the plans, &c., prepared by the borough surveyor; and the cost will no doubt be an exorbitant one. The street lies between two main streets, joining which two streets runs a very steep hill, and in order to get from one main road to another the public have for the past forty years used the street in question, in order to shorten the way, and also because it avoids one-half (much the worst half) of the steep hill, which is a public road. A few years ago one of the owners asked the present surveyor to do some repairs to this street, when he replied that it was a private street, and he could not do so. However, about seven or eight years ago, at the request of another tenant of one of the houses, he carted six or seven carts of macadam on it, and had two or three men for a couple of days putting it right and level. Did not this street, by the action of the borough surveyor at that time, become a public street according to the Act?"

The Corporation appear to be quite correct in their contention that this street is not a public street within the meaning of the Act.

T. E. C.

A Party Wall.

MERE, WILTS.—W. Z. writes: "A has asked me to pull down a place joining B. B has no end of his own, but has an old-fashioned fireplace built against A's end, and the fireplace terminates with a chimney built on A's end of house. Can A take away the end of his house and leave B's house open?"

It is extremely likely that the wall you refer to is a "party wall," and therefore belongs partly to B, if this is not so I fail to understand how B's chimneys are built! You show a chimney to A's property, but none to B's, though you have sketched (sketch not reproduced) a fireplace in the latter's house. But even if this is not the case and the wall is entirely A's property as you describe it, B has a right to the use and support of it, and A cannot remove it and leave B's rooms open to the air. The correct action for A to take in the matter is to tell B exactly what he proposes to do and to get his approval of the alterations—in writing if possible. I conclude that A is proposing to rebuild his premises. If not, then he must leave the end wall standing, though no doubt it will be very unsightly.

G. S. M.

BLACKPOOL.—BERT writes: "The sketch (not reproduced) shows a party-wall which separates property owned by two separate owners A and B. B's owner has cellared his property since the building was completed, and in doing so has merely built an offset to the party-wall, not underpinning one-half of the wall, but leaving the clay straight with the foundations and setting out 13½in. brickwork from it; the ground is good solid clay. A now proposes to cellar his property, and on excavating under the party-wall finds out what B has done. A has notified B to this effect, but B declines to take any notice further than saying that he will hold A responsible for all damage done to the wall. He maintains that if A would build out as B has done the wall would be safe. Do you think it advisable to build the required 4½in. under A's portion and risk what becomes of B's 4½in.? Will A then be responsible? Or would it be better for A to build the whole 9in.?—which he does not mind, so as to make a good job; but to do this I presume he would have to get permission from B to encroach upon this land. Do you think it advisable to build out as B has done? The length of the cellar is 17ft.'

We consider that A's best course is to underpin the whole of the party-wall after obtaining B's permission to do so. The underpinning should be carried below the floor-line of the cellar. If the ground is hard compact clay, not affected by rains or weather, it is probable that a carefully built brick offset (similar to that constructed by B) would suffice, but we prefer the underpinning method already mentioned. A is responsible for any damage which may occur from his operations; in the same way that B was previously liable for any damage or settlement which might have been directly traced to his interference with the original foundations of the party-wall.

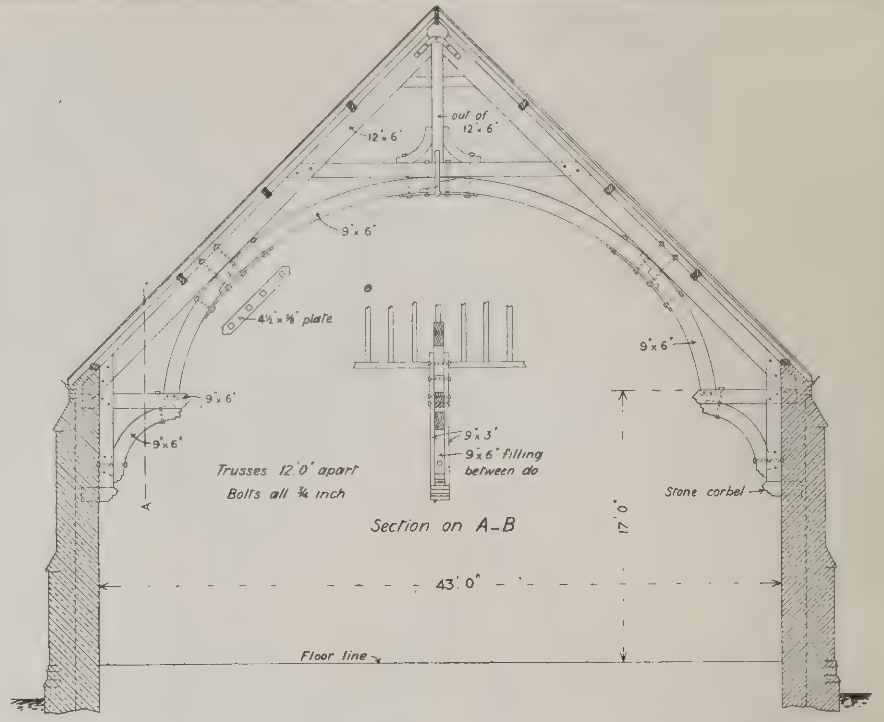
T. E. C.

A Hammer-Beam Roof-Truss.

Sunderland.—Architects write: "We send you a sectional elevation of a roof-truss which we propose to erect over a span of 43ft. Will you kindly tell us whether you consider the construction sound, and if so what in your opinion should be the scantlings of the timbers. The height to the top of wall-plate is only 17ft., and so we are anxious to get as much open space in the roof as possible, and with this object we propose that the roof should be entirely open to the underside of the covering."

The accompanying design based upon the tracing forwarded shows the scantlings that may be adopted, together with the ironwork for connecting the parts.

HENRY ADAMS.



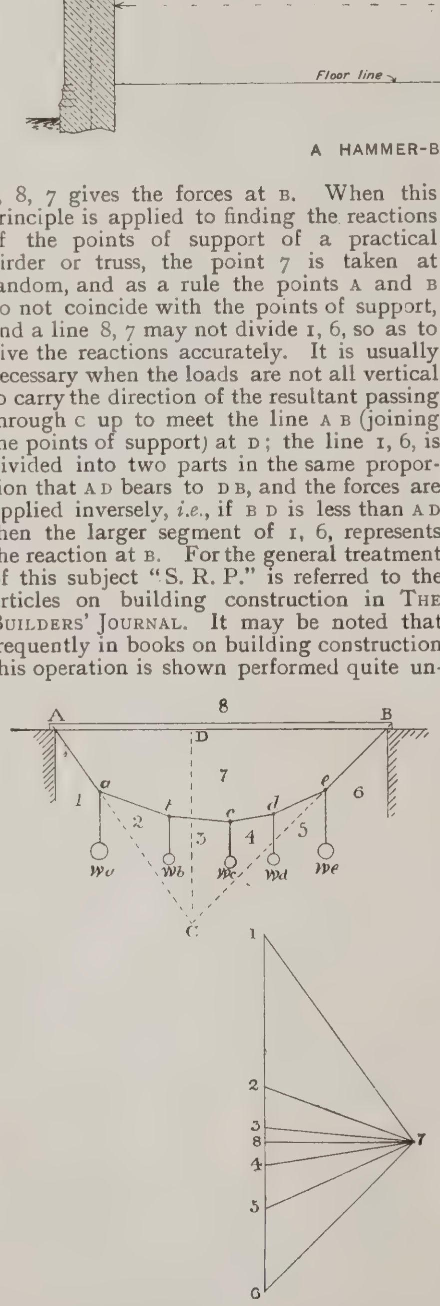
A HAMMER-BEAM ROOF-TRUSS.

Graphic Statics.

London, W.—S. R. P. writes: "Please give me a proof of the construction so commonly used in graphic statics; that the resultant of the five parallel forces shown in sketch (not reproduced) has its line of action in the dotted line."

Let "S. R. P." take a piece of wood, say 4ft. long 2in. wide and 1in. thick: let him either bore holes or make notches at the ends A and B, so that he can fasten a string to it having knots and strings as shown in the figure: now let him support the piece of wood at its ends A and B, as shown, and let him attach weights *a*, *b*, *c*, *d* and *e*, as shown; the system will take a figure like that shown. If the lines A *a*, B *e* are produced to meet at C, it will be seen that a weight at C hanging from a cord A C B may produce the same force effect upon A B and its supports as the five weights, because the forces acting on A B remain unchanged in direction. If we consider the reaction of the supports, these are together equal to the sum of the weights, therefore, the weight at C must be equal to the sum of the weights, and a vertical line through C is the line of action of the resultant of the forces *a*, *b*, *c*, *d* and *e*. Measure the depths of *a*, *b*, *c*, *d* and *e* below A B, and the horizontal distances from either support, so that you can plot the polygon; make a stress diagram of it: draw the triangle of forces about the knot *a*. You know weight *a*, therefore you can find the stresses in A*a* and *ab*. Now, if your measurements are correct when you draw the triangle for the knot *b*, the stress found for *a b* must be the same as you found for *a b* in the first triangle; the result of each successive pair of triangles having a common side is that all the triangles have a common vertex, as is found to be the case (see stress diagram). I have assumed the forces acting at the knots of the cord to be parallel vertical forces, because this is "S. R. P.'s" question; if, however, they are not parallel, the construction still holds, but in that case 1, 2, 3, 4, 5, 6 are not in one straight line, and their resultant is found by joining 1 and 6. The triangle 1, 8, 7 represent the forces at A, viz., 1, 8, the reaction of the support 1, 7, the tension in the string A *a* and 8, 7, the thrust in the stick A, B; similarly the triangle 6, 8, 7 gives the forces at B. When this principle is applied to finding the reactions of the points of support of a practical girder or truss, the point 7 is taken at random, and as a rule the points A and B do not coincide with the points of support, and a line 8, 7 may not divide 1, 6, so as to give the reactions accurately. It is usually necessary when the loads are not all vertical to carry the direction of the resultant passing through C up to meet the line A B (joining the points of support) at D; the line 1, 6, is divided into two parts in the same proportion that A D bears to D B, and the forces are applied inversely, *i.e.*, if B D is less than A D then the larger segment of 1, 6, represents the reaction at B. For the general treatment of this subject "S. R. P." is referred to the articles on building construction in The Builders' Journal. It may be noted that frequently in books on building construction this operation is shown performed quite unnecessarily. Students are cautioned against wearing themselves out in trying to understand things which have been thrown together by compilers totally ignorant of the matters they took in hand. The connections of the fragments are in many cases not comprehensible to anybody.

P.



Architects' Charges.

Fareham.—Architect writes: "What would be an architect's reasonable charges for the following works:—(1) Plans, surveys and levels of site, sections, specifications and detail drawings, quantities, tenders invited. Lowest tender considered too high. Conference with contractor presenting lowest tender. Scheme finally abandoned by owner. Lowest tender £1,500. Lithographer's and other expenses. (2) Plans and sections (no specification) of existing building; work done by owner personally under supervision of architect. Cost about £800. Architect prepares designs and arranges for supply of furniture, cost about £400; work carried out. (3) Preparing plans, sections and specifications of work. Tender £2,000 accepted. Contractor fails. Plans and specifications for a contract for remaining portion of work. New contractor called in who finishes the work for £1,500. Numerous interviews with official receiver. (4) Survey and levels of site, plans, specifications and detail drawings of new buildings, quantities prepared, tenders invited, lowest tender rejected. Lithographer's and other expenses. A few months afterwards owner carried out the work by himself, but in a modified form."

(1) 3 per cent for plans, specifications and obtaining tenders on £1,500. In addition, charge for preparation of quantities according to time and difficulty of work. Also add expenses and cost of lithographing. (2) On a small job of £800, including supervision by architect, a fair charge would be 50 guineas. For designs for furniture, &c., costing £400, you should charge according to its elaboration, say 30 guineas. (3) You are entitled to 5 per cent. on amount of contract, £2,000, plus charge for time and trouble entailed in consequence of contractor failing. (4) There is no special rate for such work; you should charge according to time involved, nature of work and expenses, with lithographer's charges, &c.

NOTICE.—The present volume of "The Builders' Journal" will end with next week's issue, and the following volume with the issue for December 30th; so that in the future there will be two volumes extending equally throughout the year.

LONDON STREET TRAFFIC.

LAST week a sitting of the Royal Commission on Transport and Locomotion in London was held.

Mr. Maurice Fitzmaurice, chief engineer to the L.C.C., was called to give evidence. In speaking of obstacles of locomotion Mr. Fitzmaurice said the breaking up of streets for laying and repairing pipes created a serious difficulty. Water, gas and other companies could now break up the streets whenever they wished on giving notice. In his opinion some controlling authority ought to be able to give these companies notice when they could break up any streets, and except during that time the streets should not be broken up unless in case of emergency. There were in London, under the control of the L.C.C., fourteen subways for water and gas mains, electric light and other cables of an aggregate length of 5½ miles. A subway 12ft. by 8ft. would cost about £18 per yard run for construction, or nearly £32,000 per mile.

Another great obstacle to locomotion is the holding of markets in streets. They certainly ought to be prohibited in all main streets, unless those of quite exceptional width. There ought to be some regulation as to carts standing outside railway receiving offices, large places of business, and places where building operations were going on. He failed to see why private firms should be allowed to monopolise the carriageway in this manner. Proceeding to speak of cross-river communications Mr. Fitzmaurice said the L.C.C. proposed to commence the construction of a tunnel between Rotherhithe and Wapping. The total cost would probably be about £2,000,000. The reconstruction of several bridges would have to be dealt with in the near future. The widening of Waterloo Bridge, or the construction of a new bridge between Waterloo and Blackfriars, was urgent. He himself would much prefer an additional bridge.

Eventually a new street from Piccadilly Circus eastward would have to be considered. With reference to north and south connections, certain proposals for new roads had been considered, amongst which might be mentioned one from the Crystal Palace district to Waterloo Road, near Waterloo Station, and then continued across the river by a new high-level bridge between Waterloo and Blackfriars Bridges. One branch of the new street might then fall to meet the eastern crescent of the new Holborn to Strand Street, and another branch might continue north by a bridge over Fleet Street, between Chancery Lane and Fetter Lane, from which point it might be continued to the county boundary. Rough estimates had been made as regards the cost of such a street from the Strand southwards to the county boundary, near the Crystal Palace. Three types of streets had been taken. Type A was a street 150ft. wide, consisting of footpaths of 20ft. on each side; the central portion of the street, 30ft. wide, to be reserved for motor and other quick traffic; while on each side of the central part would be a width of street of 40ft. for surface tramways and slow traffic. Underneath was a subway for single-decked tramcars, and there were the usual pipe subways and sewers. Type B showed a street 100ft. wide, with two footpaths, each 14ft. wide, and a roadway of 72ft. Underneath was a double subway for both quick and slow tram traffic, and there were pipe subways and sewers as in type A. Type C was, as regards the surface of the street, the same as type A, but instead of placing the tram-cars in the shallow tramway they were carried in two tubes at a deep level. The pipe subways and sewers were as in the other types. The cost of these roads, including 150ft. of land on each side, was estimated at £2,560,000 per mile for type A, £2,400,800 per mile for type B, and £2,740,000 for type C.

Asked whether he had considered the question of providing subways for pedestrians, he replied that the existing subway crossings were not generally used. Among the subways for tramways which he thought might be constructed was one from Hammersmith Broadway to Piccadilly.

TRURO CATHEDRAL.

ON Wednesday last the nave and central tower of Truro Cathedral were formally opened in the presence of the Prince and Princess of Wales. The late Mr. J. L. Pearson, R.A., was selected as the architect of the cathedral in 1878. In May, 1880, the foundation-stones were laid by the King, then Prince of Wales. The erection of the choir, transepts, baptistery and a portion of two bays of the nave was completed in November, 1887. For nine years after the consecration of this part no special effort was made to continue the building; but the sudden death of Archbishop Benson, the first Bishop of Truro and founder of the cathedral, recalled the whole idea of the building to the public mind, and suggested its completion as a fitting memorial of one who had done so much for the Church. Money was again forthcoming, and building was resumed in June 1899, the designs of Mr. J. L. Pearson being faithfully carried out by his son, Mr. F. L. Pearson. The western portion of the cathedral now completed comprises the nave and aisles, with western double porch or narthex, south porch, and western towers. The architecture of the cathedral is Early English with characteristics of the buildings of the early part of the thirteenth century. Its walls are mainly built of Cornish granite, with serpentine from the Lizard for its steps and grey-tinted stone for the shafts of its pillars. Its sculpture, windows and monuments commemorate Cornish saints and other local benefactors. The nave is 112ft. long, 29ft. wide, and about 70ft. high. It is divided into four bays, and these are again subdivided so that the nave arcades consist each of eight arches. The main piers are circular with attached shafts and boldly projecting groin shafts on the nave side; the intermediate piers are elongated, much narrower, and with similar attached shafts. The general lines of the nave follow to some extent those of the choir. They have the same acutely pointed and richly moulded arcade arches and bold and very broadly treated triforia. The details of the design are, however, much varied, the arches of the triforia being filled in with a series of four pointed arches springing from detached shafts, and with a large cusped circular opening over them, suggesting incipient rather than developed tracery. The nave, like the choir, is vaulted in stone, but on a different plan. It is sexpartite, while that of the choir is quadripartite. The bays of the nave, 28ft. wide, intersected by massive transverse ribs, have a very bold and imposing effect as contrasted with the narrower and perhaps more refined treatment of the choir. The north and south aisles of the nave are 112ft. long and 14ft. wide in the clear of the arcade walls, giving a total width of nave and aisles of 62ft. The western bay of the cathedral is separated from the nave by a lofty arch, while over this western bay is a gallery which not only provides additional accommodation, but forms a base to the west end internally and adds much to its effect. The west end is perhaps one of the most imposing features of the cathedral. It differs from the majority of ancient cathedrals, either in this country or abroad, in that the western doorways are two, not three or one. They enter directly into the nave through a shallow narthex, and not, as is frequently the case, into the aisles through the western towers. These doorways are of lofty dimensions and are elaborately treated and recessed under gabled arches, the tympana being filled with sculpture. The western towers have not yet been carried above their second stage. The central tower, which is the crowning dignity of the cathedral, is square. The spire rises in simple and unbroken outline from a rich cluster of pinnacles and spire lights which are grouped around its base. The height to the top of the spire is 250ft.

Builders' Notes.

New Naval Barracks, Portsmouth, have been supplied by Messrs. E. H. Shorland & Brother, of Manchester, with a number of their patent Manchester grates.

Mr. Robert Boyle having acquired the whole of the shares of Robert Boyle & Son, Ltd., the well-known firm of ventilating engineers, will in future carry on the business under its original title of Robert Boyle & Son.

New York Building Strike.—Fifty thousand men have accepted the employers' terms and returned to work. The effect of these is to do away with the walking delegate. Provision is also made for the appointment of a Joint Arbitration Board to settle trade disputes. Many labourers and a large number of unskilled hands have resumed work.

Wallpaper in Roumania. — The British Vice-Consul at Galatz says in a recent report that most houses in Roumania are stencilled and not papered, but those of modern construction are not considered finished unless they are papered, and with designs which are pleasant to behold. British wallpaper designs are unknown. The supply comes from France, Austria-Hungary and Germany. No doubt with a little adroitness a demand could be created for this article, but this could not come about by simply posting samples and price lists (which British firms so often think is enough). This, like so many other goods, must be pushed and brought to the notice of the public as well as of the dealers in Roumania.

A New Railway between Yarmouth and Lowestoft, constructed jointly by the Great Eastern, Great Northern and Midland Railway Companies, was opened for passenger traffic last week. It is about nine miles in length. The new line passes through Gorleston, Hopton and Corton. The engineering works on the new line are of a somewhat heavy character. This is especially so at the Yarmouth end, where, in order to make their connection with the three companies' line, the Midland and Great Northern Joint Committee have had to throw a viaduct no less than 800ft. long over the continuation of Yarmouth Harbour known as Breydon Water, besides constructing smaller bridges over the River Bure and over the Great Eastern line from Norwich. The Breydon viaduct has been erected by Messrs. E. Finch & Co. from the designs and under the supervision of Mr. A. Ross, chief engineer of the Great Northern Railway Company, and Mr. W. Marriott, engineer to the Midland and Great Northern Joint Committee. It consists of five spans, one of which is a swing span having two openings of 60ft. clear waterway in order to admit the passage of ships and river craft. A special feature of the bridge is that the machinery for working the swing span is all in the turret above the pivot of the span, a gas engine as well as hydraulic machinery supplying the power for swinging the span.

Bricks and Mortar.

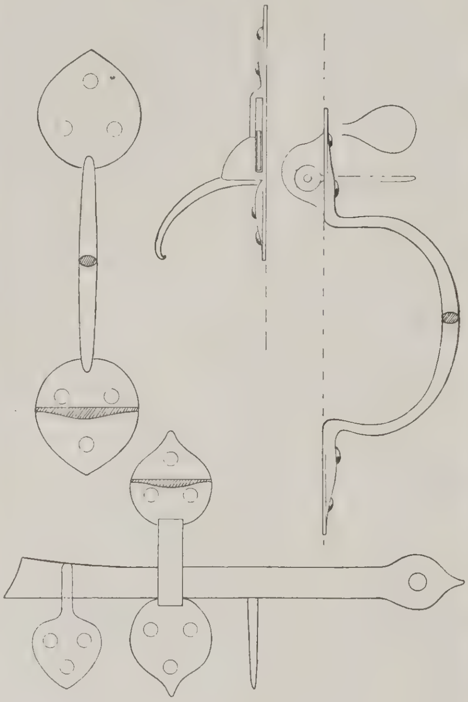
Aphorism for the Week.

I have not chanted verse like Homer, no—
Nor swept string like Terpander, no—nor carved
And painted men like Phidias and his friend:
But I have entered into sympathy
With these four, running these into one soul,
Who, separate, ignored each other's arts.
Browning.

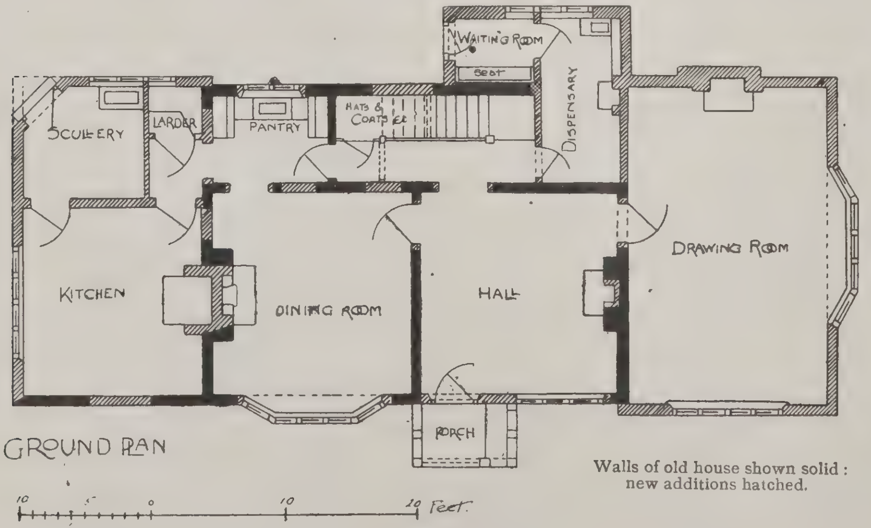
Our Plates. "The Paddock," Ruskington, for Dr. Thompson, is an old house added to and restored by Messrs. Brewill & Baily, of Nottingham; the plan below indicates the old and the new work. The accommodation provides a spacious entrance hall, dining-room, drawing-room, consulting-room, and kitchen, offices, &c. The exterior is constructed with red bricks up to the first-floor level, the upper part being covered with rough-cast and roofed with red tiles. The accommodation on the first floor consists of five bedrooms, with dressing-room, bathroom, &c. The work has been ably carried out by Mr. Frank Pattinson, builder, of Ruskington.—Mr. James A. Swan, of 56, Newhall Street, Birmingham, is the architect of the house at Edgbaston for Mr. W. A. Cadbury. The drawings show the alterations and additions of a new wing. Externally the walls are stuccoed similar to the old work and the roofs covered with green slates. Internally the hall, staircase and panelling are of oak. The metal fittings, door furniture, glass and other decoration were designed by the architect. The house is heated throughout by hot water. The work has been carried out at a cost of £4,500.

London Municipal Offices. The Select Committee of the House of Lords last week considered Local Government Provisional Order (No. 5) Bill, the object of which is to confirm provisional orders granted to the metropolitan boroughs of Hampstead, Holborn and Lambeth by the Local Government Board, and authorising these boroughs to acquire certain lands compulsorily for the erection or extension of municipal offices and buildings. There was no dispute as to the land being required or as to its being suitable for the purposes proposed. The London County Council opposed, in order to obtain the insertion of a saving clause preserving the operation of the Metropolis Management Acts and the London Building Acts. The promoters agreed that there was no intention of exempting the land from the provisions of the Building Act, and all the London County Council asked was that that should be made clear, not by possible litigation hereafter, which might be taken to the House of Lords but by the insertion of a simple clause in the Bill. For the Council it was denied that plans would have to be submitted to the London County Council. Ultimately, the Committee found against the insertion of the clause.

A Door Latch. A well-known architect writes:—I see on page 211 of your issue for May 20th a useful and instructive illustrated article on building construction. But is it not a pity that students should be instructed with such pitiful want of taste? Let the illustration of the thumb-latch be compared with the accompanying tracing. Here is a detail I have made from an old example, translating the outline of the original pattern freely to suit my own taste. I have had similar latches to these in use for many years, and know that they are quite practical and satisfactory. They can be procured from Mr. W. B. Reynolds, of 28, Victoria Street, S.W.



Discoveries at Beni Hasan. There is now on view in the rooms of the Society of Antiquaries, Burlington House, an exhibition of Egyptian antiquities discovered during the past season by Mr. John Garstang, Reader in Egyptian Archæology at Liverpool University College. Reference was made to these discoveries on p. 258 of our issue for June 17th. The site of Beni Hasan is about half-way between Cairo and Abydos, and the objects discovered—unlike those of Professor Petrie and his coadjutors now shown at University College—are attributed to one period only—the XIth and XIIth dynasties, or about B.C. 2200; and are for the most part illustrative of the ancient burial customs and industrial methods of the Middle Empire. They exhibit a considerable variety in artistic merit, and also furnish some evidence of the relations of this to neighbouring regions. Mr. Garstang found more than 100 tombs which had never been entered since they were closed about 4,000 years ago over their contents. One of the most remarkable objects is a model of a granary like those still in use, with holes in the top for the admission of the grain, and means in the perpendicular side for gradually letting out the grain. This illustrates, like the small hand-winnowing fans which are still in use among the Arabs, the continuity of habits and practices of the people in this wonderful country. The various callings of mankind are strikingly illustrated by the models of boats with the rowers, steering men and passengers, and it is remarkable that the steering apparatus is simply and economically worked with levers. The operations of brewing and baking are also shown in miniature. Figures portraying the sacrifice of an ox—made of wood, plastered and painted—are believed to be unique of their kind. There are, too, well-worked legs of chairs, quite like a piece of modern mahogany. The exhibition will remain open until Saturday, July 25th.



Walls of old house shown solid: new additions hatched.

"THE PADDOCK" RUSKINGTON, LINCS. BREWILL AND BAILY, ARCHITECTS.

An American Colosseum. A stadium of vast dimensions and classic design is to be built on Soldiers' Field, the Playground of Harvard College, on the banks of the Charles River. This structure will be shaped like a flattened horseshoe, or, to make a closer comparison, it will resemble a continuous stand following the two long sides of a football field and one of the short sides. But its dimensions will beggar those of any grand stand used for athletic sports. The length of the arena enclosed will be no less than 450ft., and the extreme length of the whole building as viewed from the road that crosses Harvard Bridge will not fall far short of 200yds. In other words, the stadium will be about equal to the Colosseum in length, but will afford a larger arena. At first sight the vision of an inflated football stand with a classical name suggests rather the modern circus than the ancient Colosseum. But the plans of the Harvard stadium have been prepared by Mr. McKim, and its design is as remarkable for simple elegance as for constructive ingenuity and economy. The framework will be of iron girders, the facing of concrete blocks. The vast iron skeleton within will be entirely concealed under a mask of yellow white that will present, with practically the same effect as solid stone, all the familiar aspects of a Roman amphitheatre. Tier upon tier of seats will rise to a height of 100ft., affording seats for 24,000 spectators on ordinary occasions, for 40,000 in an emergency. Behind and above the topmost row will run a roofed gallery supported on light pillars; this is designed to provide a sheltered promenade and to give a necessary architectural finish to the building as seen from within. The exterior aspect of the stadium will be on lines that the form of the interior makes inevitable. A colonnade of three super-posed galleries surmounted by a heavy cornice, unadorned by superfluous embellishment, will give simplicity and severity to the outward aspect of the building. The height being about two-thirds that of the Colosseum, the massiveness of the piers, or rather of the appearance of the piers, will also be somewhat less.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

During the week ending July 18th fifteen failures in the building and timber trades in England and Wales were gazetted.

J. Clarke, builder, Manor Park. Adj. July 6th.

J. E. Dyne, builder, Willesden Green. Adj. July 11th.

R. Hedley, joiner, Stamfordham. Adj. July 1st.

I. Gibson, builder, Hull. R.O. and adj. July 10th.

C. Shepherdson, builder, Hull. R.O. and adj. July 6th.

J. Davies, builder, Llanelly. R O. and adj. July 1 th.

W. G. Brown, contractor, Leicester. Adj. July 11th.

J. Cooper, plasterer and builders' merchant, Stockton-on-Tees. R.O. July 7th.

A. T. Haines & Co., builders, West Ham. R.O. July 10th.

J. Molyneux, builder, St. Helens. Adj. July 4th. Gross liabilities £1,169; assets £659.

A. Tillotson, decorator and upholsterer, Wandsworth. Adj. July 9th.

E. Cave, timber merchant Sheffield. First meeting, O.R.'s, Sheffield, July 20th, at 3.

J. Gibson, builder, Newburn. Liabilities £689; assets £2. Started with £50 borrowed from his father.

G. S West, builder, Herne Bay. Liabilities expected to rank for dividend £2,744; assets estimated at £534.

J. H. May & J. Williams, builders, Abertillery. Liabilities £174; assets £10.

W. Franks, builder, Wednesbury. Gross liabilities £179; assets £5; deficiency £174.

J. Matthews, builder and contractor, Aberkenfig. Gross liabilities £2,339. of which £2,055 is expected to rank for dividend; deficiency £682.

C. F. Gee, builder, Dover. Gross liabilities £392, of which £374 are to rank for dividend; assets estimated at £132.

W. Gibson, builder and contractor, Exeter. Adj. July 8th. Gross liabilites £3,308, of which £2,261 is expected to rank for dividend; assets £2,154; deficiency £107.

D. Morgan, builder and contractor, Swansea. First meeting, O.R.'s, Swansea. July 24th, at 12. P.E., Swansea Town Hall, July 31st, at 11 30.

R. Francis, builder, Gilfach Goch. First meeting, 117, St. Mary Street, Cardiff, July 20th, at 12. P.E., Cardiff Town Hall, August 4th, at 1 .

W. Moses, builder and contractor, Sennybridge. First meeting, 135, High Street, Merthyr Tydfil, July oth, at 2. P.E., Merthyr Tydfil Town Hall, August 12th, at 3.

F. H. Hopkins, builder and contractor, Brixton. R.O. July 8th. First meeting, Bankruptcy Court. July 23rd, at 12. P.E., Bankruptcy Court, August 18th, at 12.

A. E. Keys, builder, Streatham. First meeting, 24, Railway Approach, London Bridge, S.E., July 20th, at 11.30. P.E., Wandsworth C.C., August 6th, at 12.

E. Hughes, builder, Stroud Green. R.O. July 8th. First meeting, Bankruptcy Court, July 27th, at 11. P.E., Bankruptcy Court, August 18th, at 12.

J. King, contractor, Kilburn. Adj. July 10th. First meeting, Bankruptcy Court, July 22nd, at 2.30. P.E., Bankruptcy Court, August 25th, at 11.

W. Dawbarn & Co, builders' merchants, Liverpool. First meeting, O R.'s, Liverpool, July 20th, at 12. P.E., Liverpool C.C., July 23rd, at 11.30.

C. F. Rowthorn, stonemason, Portsmouth. R.O. and adj. July 10th. First meeting, O.R.'s, Portsmouth, July 22nd, at 3. P.E., Portsmouth C.C., July 27th, at 11.30.

W. B. Joslin, builder, Hull. Gross liabilities £7.986; £7,730 fully secured; £256 to rank for dividend; assets £200; deficiency £34.

G. & J. Ambrose, builders, contractors, &c, Colchester. Adj. July 3rd. First meeting, Cups Hotel, Colchester, July 24th, at 11. P.E., Colchester Law Courts, July 30th, at 11.30.

R. Boulton, joiner and undertaker, Dalton-in-Furness. First meeting, O.R.'s, Barrow-in-Furness, July 29th, at 12. P.E., Barrow-in-Furness Magistrates' Court, July 29th, at 3.

Payne & Hastings, timber merchants, London, E.C. R.O. July 1st. First meeting, Bankruptcy Court, July 23rd, at 12. P.E., Bankruptcy Court, August 25th, at 11.30.

H. Fuller, plumber, painter and glazier, Norwich. R.O. and adj. July 8th. First meeting, O.R.'s, Norwich, July 22nd, at 3. P.E., Norwich Shirehall, July 22nd, at 11.

D. Ellis, builder and contractor, Llandudno. Adj. July 8th. First meeting, Crypt Chambers, Eastgate Row, Chester, July 20th, at 11.15. P.E., Bangor Magistrates' Room, August 15th, at 12.15.

E. K. Purnell, architect and surveyor, Coventry. R.O. and adj. July 7th. First meeting, O.R.'s, Coventry, July 22nd, at 12. P.E., Coventry County Hall, August 5th, at 2 30.

Durrant & Green, plumbers, painters and house decorators, Malvern. R.O. and adj. July 4th. First meeting 45, Copenhagen Street, Worcester, July 18th, at 11.30. P.E., Worcester Guildhall, July 28th, at 2.15.

E. Lamb, brickmaker, Chester. R.O. July 6th. Adj. July 7th. First meeting, Crypt Chambers, Eastgate Row, Chester. July 20th, at 2.30. P.E., The Castle, Chester, August 6th, at 11.

B. J. Parkes, builder, contractor, carpenter and joiner, Wednesbury. R.O. June 30th. First meeting, O.R.'s, Wolverhampton, July 20th, at 12. P.E., Walsall C.C., July 21st, at 11.30. Gross liabilities £473; assets £150; deficiency £323.

The following companies have decided to wind up:—

Aberthaw Blue Lias Lime Co, Ltd, Lower Penarth. F. A Jenkins, Exchange Buildings, Bristol, liquidator.

Granite Corporation, Ltd.

Midland Building and Supply Co., Ltd., Tipton. T. G Mellows, King John's Chambers, Nottingham, and another, appointed liquidators

Noiseless Flush Cistern Co, Ltd, Halifax First meeting, O.R.'s, Halifax, July 15th, at 3.

Trade and Craft.

A Gas Boiler.

An interesting and useful novelty has recently been placed on the market by Messrs. Wilsons & Mathiesons, Ltd., of Carlton Works, Armley, Leeds, in the shape of a boiler, which has been specially designed and constructed to supply the demand for a cheap, durable and economical gas set pan. The Wilson "Scarbro" gas boiler is being extensively introduced into new houses in place of the old coal fixtures. The gas boiler has a combined steam outlet and flue as shown in the accompanying illustration, and is made of strong planished copper, tinned with pure metal. The top, hinged lid, and flues are of fine galvanized cast iron. The legs are of strong cast-iron japanned, and the case is of galvanized plate-iron. As the boiler stands on legs, the floor underneath can be properly cleaned. Messrs. Wilsons & Mathiesons have showrooms at 58, Boar Lane (corner of Albion Street), Leeds, and also at 76, Queen Street, Cheapside, London, E.C.

Non-Flammable Wood.

The Non-Flammable Wood and Fabrics Co., Ltd., of Townmead, Road, Fulham, S.W., issue a pamphlet giving concise particulars of non-flammable wood and fabrics as supplied by them. The wood is submitted to a series of operations consisting, first, of a vacuum treatment by which the pores are opened and partially cleansed; second, saturating with a fireproofing solution throughout the various pores and tissues; and, third, evaporation of the water of the solution: the whole resulting in rendering the wood incapable of spreading flame, causing it instead, when subjected to fire, to merely carbonize slowly at the point of contact. The woods that lend themselves best to successful treatment are:—Ash, beech, birch, chestnut, deals, elm, firs, mahogany, pines, walnut and whitewood. Oak and teak are more difficult to treat, and require a special process. Non-flammable wood takes paint, polish and varnish equally as well as similar wood untreated: in fact, it especially lends itself to a beautifully even polish. The time for treatment varies according to the description and thickness of the wood; including drying, it occupies from twenty to forty days, but the company keep large quantities of stock timber on supply. The cost of non-flammable wood varies according to its thickness and character. A deal door costing 30s. would cost 35s. if made of non-flammable deal: a pine mantelpiece of ordinary wood costing £2 10s. would cost £3 5s. if made of non-flammable wood: on the unwrought wood the proportion of increased cost is higher. Non-flammable wood has been used at the British Museum, Windsor Castle, Wyndham's Theatre, Earl's Court Exhibition, Harrod's Stores and many other important buildings throughout the kingdom. It is undoubtedly an excellent safeguard against fire.

The Editors of THE BUILDERS' JOURNAL, in response to many repeated requests by students and others, have compiled the following list of the most suitable books published on the various subjects which appertain to architecture and the building trades. Special arrangements have been made to enable readers to be supplied with books at the published prices, *post free.* An endeavour will be made to obtain for regular readers and subscribers any other Technical Books not in this or succeeding lists, and these will also be forwarded to them post free. The names given in brackets are those of the authors or editors of the respective books.

The Builders' Journal List of Technical Books.

Remittances for the amounts stated below should be sent by postal orders, addressed to THE PUBLISHER, TECHNICAL JOURNALS, LTD., 6, Great New Street, London, E.C.

No. 2 LIST.

ART, DECORATION, AND DESIGN.

THE LONDON
OF OUR
FORE-FATHERS

is rapidly disappearing, and many picturesque bits of Old London have already been demolished to make room for modern requirements.

The following Photogravures (reproduced by the Rembrandt Process), from originals by Mr. F. L. Emanuel, form a lasting record of many of these interesting buildings.

No further copies can be published, as the plates have been destroyed, and the pictures are therefore quite unique.

Single Copies at the following Prices:—

1.	**The "Old Horse and Groom,"** Back of Holborn - above - Bar (since demolished).	6d. each.
2.	**Holywell Street,** from St. Clement Dane's Church (since demolished).	2s. 6d. each.
3.	**The "Old Bell,"** Holborn (since demolished).	1s. 6d. each.
4.	**Leather Lane,** Holborn	1s. 0d. each.
5.	**Davies Street** (since demolished).	9d. each.
6.	**Fetter Lane,** View from Holborn.	6d. each.
7.	**King Street,** Westminster (since demolished).	1s. 6d. each.
8.	**Staple Inn,** Holborn.	2s. 6d. each.
9.	**Milford Lane,** Strand, and Booksellers' Row, looking West (since demolished).	6d. each.
10.	**Lincoln's Inn Fields.**	1s. 6d. each.
11.	**Archway,** Portugal Street, Lincoln's Inn Fields.	9d. each.
12.	**Old Houses in Strand.**	6d. each.

(*Continued on p.* xviii.]

This has been specially constructed to meet the requirements of the trade for a cheap yet serviceable Boiler, with combined steam outlet and flue. The Boiler is of strong planished copper, tinned with pure metal. The top, hinged lid, and flues, are of fine cast-iron galvanized, the legs are of strong cast-iron japanned, and the case of plate-iron galvanized, making a thorough useful, economical, and durable article.

As the Boiler stands on legs, the floor underneath can be properly cleaned.

Made in one size only—

12 gallons with copper boiler tinned: size outside, 21¾ ins. by 31 ins. high; size of flue outlet, 3 ins.

Price £2 15s. 0d.

DRAW-OFF COCK, 6/6 extra.

Gas Water Boilers of all sizes and descriptions.

Makers of the well-known Wilson Gas Cooking and Heating Stoves.

Simplex Conduits.

The "Simplex Steel Conduit System" is now recognised by all the leading authorities to be the **best method** of installing Electric Wires. It is now almost **exclusively employed** for all kinds of installation work.

ECONOMY and EFFICIENCY

are secured by the use of Simplex. Do not be satisfied with imitations. Every Conduit and Fitting stamped "Simplex."

We are devoting a big factory and all our energies to the bringing out of one product, and it is owing to this concentration of all our efforts that our system to-day stands in the **very front rank** of wiring systems.

THE

BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

July 29, 1903. Vol. 17, No. 442. 9, East Harding Street, E.C.

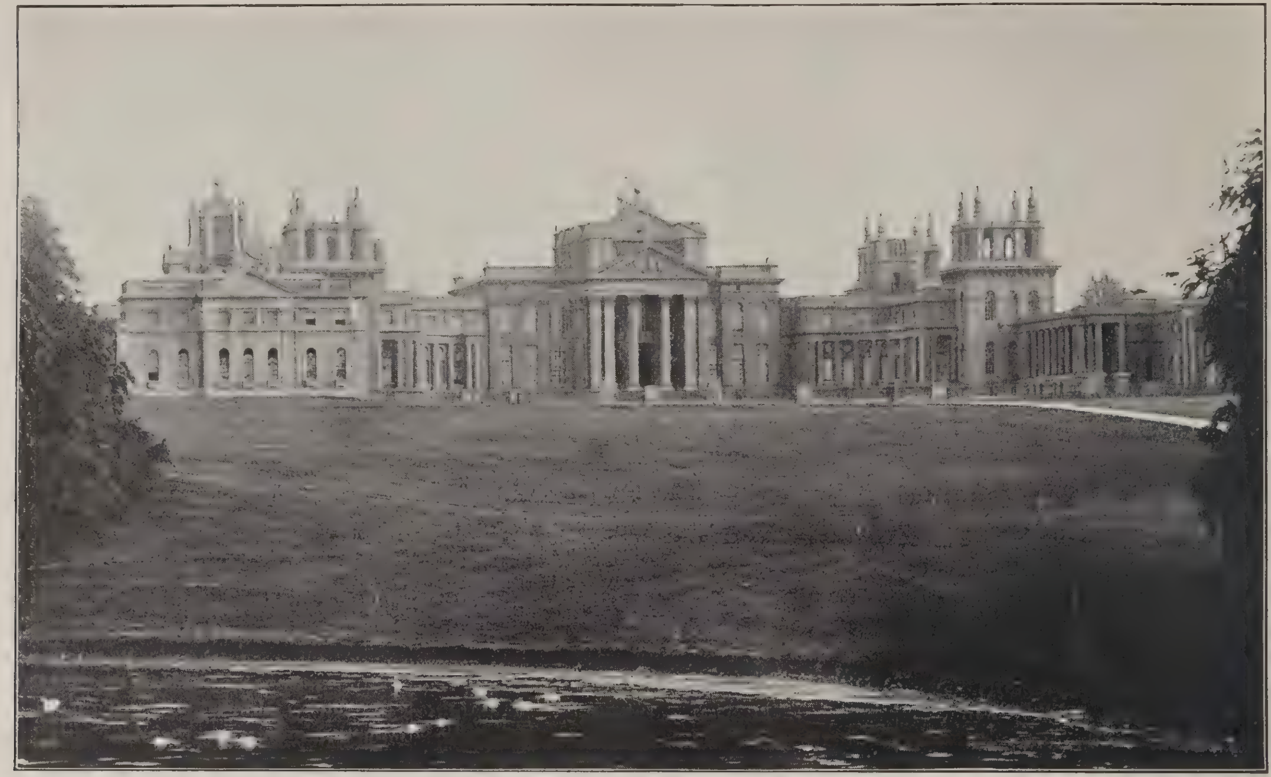
The Queen Victoria Memorial. THE preparation of the site for the National Memorial to Queen Victoria is now well in hand, a start having been made on Tuesday last week. The semicircle in front of Buckingham Palace has been struck, and it is hoped that a good portion of the levelling will be finished during the absence of the Court; the work is arranged to be completed by the beginning of November. The details of the scheme have already been published in this journal and readers will remember the "Queen's Garden" which has now been commenced: it will also be remembered that the work proposed includes the levelling up of the ground that slopes down to the lake in St. James's Park and the building of a retaining wall next the water. The present contract also includes the construction of a new footpath across the Green Park from the memorial, with an outlet opposite the Naval and Military Club in Piccadilly. Eventually the fence at the left side of the Mall as one faces the Palace will be set back some distance, and the fence on the Piccadilly side moved forward so as to bring this fine avenue into direct line with the memorial and with the Palace frontage. Two changes have however been made since the scheme was last before the public. The carriageway outside the semi-circular colonnade has been abandoned and low iron railings have been substituted for the admirable stone screen shown in front of the Palace in the original design. The traffic will therefore pass in front of the Palace much as it does now. We regret that these changes have been made, for they greatly detract from the appearance of the scheme. We cannot think that they have been dictated by any other motives than those of cost. With the memorial itself Mr. Brock is now busy, but it must necessarily be a long time before the work is finished: no fewer than twenty-five figures are included in it, so that the sculptor has a great task to accomplish. While referring to this matter it is opportune to note that the London County Council, by arrangement with the Office of Works, has undertaken to settle with the leaseholders whose premises are required for the making of the "triumphal avenue" that will lead from the Memorial to Charing Cross and will carry out the work of demolition and construction so as complete the road this summer: in exchange for which the Council will be allowed to acquire on very favourable terms the building where they now hold their meetings, and as much of the roadway and old Admiralty buildings as may be needed—for the new county hall. So here at last is to be their Elysium: certainly an admirable one after the ridiculous proposals which have emanated from Spring Gardens within the last few years. It is understood that the new building will follow the line of Carlton House Terrace.

Trafalgar Square. LAST Wednesday the "Daily Chronicle" published a large illustration of "Trafalgar Square—as it should be"; showing the place laid out with flower-beds and grass plots. The idea has of course been mooted many times, and we should have no occasion to refer to it now were it not for the fact that the manner of laying-out the Square as suggested by the "Chronicle"—and as most people have it in their mind's eye—would quite spoil its appearance. There can be no doubt that the present wilderness of stone is unsatisfactory, but it would be making matters worse to splutter garden plots and fancy beds over it. The result would be finicking and quite out of keeping with the column that dominates the spot. If anything is done it should be with an eye for breadth of effect. We want no gardener's finery or toy flower beds, but a restful lawn over the whole area, relieved with harmonious masses of colour in a few places only.

The Martyrs' Memorial at Oxford. AN alarmist statement was recently circulated respecting the ruinous condition of the Martyrs' Memorial at Oxford. We are glad therefore to note that Mr. Horace E. Clayton, the vicar of St. Mary Magdalene's, Oxford, asserts there is no need for any alarm about the stability of the memorial, which is clearly apparent from the report of the architect, Mr. H. W. Moore, F.R.I.B.A. Everyone who has examined this beautiful monument, says Mr. Moore, will know that it is a solid structure, arranged in an hexagonal form, with a base of about 14ft. diameter, raised upon a stepped platform spreading to about 31ft. diameter. The monument is built on such practical lines, starting from a solid base and tapering in a pyramidal form to a height of over 70ft. in stages most gracefully proportioned, that it must be apparent to all that it cannot collapse. The kind of decay which may be described as the crumbling process has begun to manifest itself on the surface. Some few of the richly-worked stones have fallen, but only those who are specially looking for defects would discern the vacant places. It is quite possible that other pieces of the enrichments may fall at intervals, but should they do so they will drop within the railed enclosure without any risk to passers-by. The facework has scaled in places owing to the weather, but so slightly that there can be no reason for anxiety; the drapery of the figures also shows signs of perishing; further, there is an incrustation of dust in the clefts and crannies of the ornamental work which might suggest further decay. "From my examination there appear to be no signs of inherent weakness in the structure; the defects noted are but superficial, readily admitting of repair when the proper time comes. My opinion is that it is premature to contemplate anything like a general restoration of the monument at the present time; it can be safely postponed for some years to come. The only recommendations which I would now make are (1) that the steps forming the platform (some of which have slipped out of place) should be reinstated; and (2) that the gutter running behind the parapet of the first stage should be thoroughly cleaned and rendered watertight. The suggestion that the monument is in a 'ruinous' condition is nothing else than an exaggeration."

The Porched House, Southover. IT is rumoured that the Porched House at Southover, near Lewes, which is said to have been the residence of Anne of Cleves, the divorced wife of Henry VIII., is about to be pulled down and replaced by a row of cottages. It is not certain whether Anne of Cleves occupied the house, but it is not improbable she did, as the Manor of Southover was assigned to her by Henry VIII. on January 20th, 1541, and according to Mark Antony Lower, the historian of Lewes, a competent authority, the house is of that date, the porch having been erected in 1599 by one of the Shelley family, whose initials it bears.

The late Mr. Penrose. PERMISSION having been given by the Dean and Chapter, the Council of the Institute propose to erect a tablet to the memory of the late F. C. Penrose in the crypt of St. Paul's Cathedral. This tablet will be of Istrian stone and the inscription on it will include—"Architect, Antiquary and Astronomer; a profound Scholar; Author of the *Principles of Athenian Architecture*, whose distinguished services in revealing the refinements of Greek Architecture are here commemorated by his professional friends and admirers." Any members wishing to share in the expenses of the memorial should address their communications to the secretary, 9, Conduit Street, Regent Street, W.



BLENHEIM PALACE: NORTH FRONT FROM LAKE. SIR JOHN VANBRUGH, ARCHITECT.

SIR JOHN VANBRUGH.*

SOLDIER, COURTIER, DRAMATIST AND ARCHITECT.

By D. A. BEVERIDGE.

THE policy of the Duke of Alva in the Netherlands was one of great cruelty, and among the many Protestants who left the land of their birth and passed over to England was the grandfather of the subject of this memoir. He was a native of Ghent, and evidently a man of considerable means, for on his death his son, Giles Vanbrugh, was left in fairly affluent circumstances.

Several authorities state that Giles was a sugar baker in Chester, but this is not at all likely, for in Blome's "Britannica" he is described as gentleman, and we have definite knowledge that he was comptroller of the Treasury Chamber. He married Elizabeth, the daughter of Sir Dudley Carelton (nephew of Lord Dorchester), of Imber Court, Surrey. It is not known when he received the appointment of comptroller, but very probably this was obtained after his marriage, through the interest of friends acting on his behalf.

John Vanbrugh was the second son of the marriage, and he was born in the parish of St. Nicholas Acons in the year 1664. Little is known regarding his education, but he appears to have received part of it at Chester Grammar School. He was sent to France when nineteen years of age, but whether to study architecture or other things is not known; no doubt the language and foreign travel would be the primary objects of his tour. (France at this time was in the height of her prosperity, Louis XIV. being on the throne.)

He was abroad for two years, and on his return received a commission in the Earl of Huntingdon's regiment, formed a few months before his arrival. Five years afterwards Vanbrugh was apprehended at Calais on the supposed charge of sketching fortifications, and also of travelling without a passport. He was at this time about twenty-six years of age. When he had had eighteen months' imprisonment, and after being rather badly treated, he was transferred to the Bastille. In this grim abode he was allowed more freedom, and, it is said, spent much of his enforced leisure in drafting comedies. Whatever was the reason of his imprisonment, he appears to have been set at liberty about November 22nd, 1692, after having spent more than two years in prison. He joined his old regiment and attained the rank of captain, so that until receiving the knighthood he was always known as Captain Vanbrugh.

During his military career he became acquainted with Sir Thomas Skipworth, who was a shareholder in Drury Lane Theatre, and no doubt they had many discussions on the drama. Vanbrugh was evidently encouraged in his writings after having shown some of his productions (several scenes from the "Provoked Wife"), but nothing was staged until several years later.

In 1695 Vanbrugh was made secretary to the Greenwich Hospital Commission, through Evelyn's "nomination of him to the Lords." The Commissioners were appointed to report on the state of the palace and the sum required for its conversion into a hospital.

The production of Cibber's "Love's Last Shift" in January, 1696, inspired Vanbrugh to give a comedy to the stage, and the result was "The Relapse, or Virtue in Danger," a sequel to the afore-mentioned play. It was produced at Drury Lane, was very well received, and had a success the theatre was much in need of.

The Italian Opera House, of which Vanbrugh was architect and manager, and author of many of the plays produced there, was opened in April, 1705, the foundation-stone having been laid by Lady Sunderland, daughter of the Duke of Marlborough. The building was built with the help of his wealthy friends, and it may be mentioned in passing that Vanbrugh always retained the firm friendship and goodwill of the many noblemen and gentlemen with whom he came in contact during his architectural career. The Opera House was not adapted for sound—being better for song than for dialogue—and the piece was withdrawn after it had been on the boards for about a fortnight. It is not clear whether anything was done to improve matters.

Vanbrugh lost some money by this venture, for according to a letter to the Earl of Manchester he remarked that "he was glad to get rid of it (the theatre), but trusted better days were in store for the drama." His plays were lacking in originality, but he excelled in wit and the happy balance of parts. "The Relapse," "Provoked Wife" and "The Confederacy" are accounted his best. "The Journey to London" was left unfinished at his death, but was re-cast by Colley Cibber, and remained a great favourite with the play-going public.

Vanbrugh may be classed among his contemporaries Congreve, Wycherley and Farquhar, who among them developed the "Comedy of Manners" or "The Artificial Comedy," the source of many of Sheridan's and Goldsmith's best plays. Voltaire praised Vanbrugh for being the gayest, Congreve the wittiest, and Wycherley the strongest of the English playwrights.

Perhaps the same lack of fusion in his plays might be traced to a lesser extent in his architecture. Being a man not influenced by precedent in any way, and not liable to do things by halves, he unfortunately incurred the ire of many people of his time who were great sticklers for precedent and disliked novelty in any shape or form.

Swift wrote:

> Van's genius without thought or lecture
> Is hugely turned to architecture.

It is not at all clear why or how Vanbrugh turned his thoughts to architecture. Possibly, and very probably, he started with a small mansion, and finding he had a certain talent for design, decided to pursue it; it being customary for gentlemen in those days to dabble in many arts.

Castle Howard.

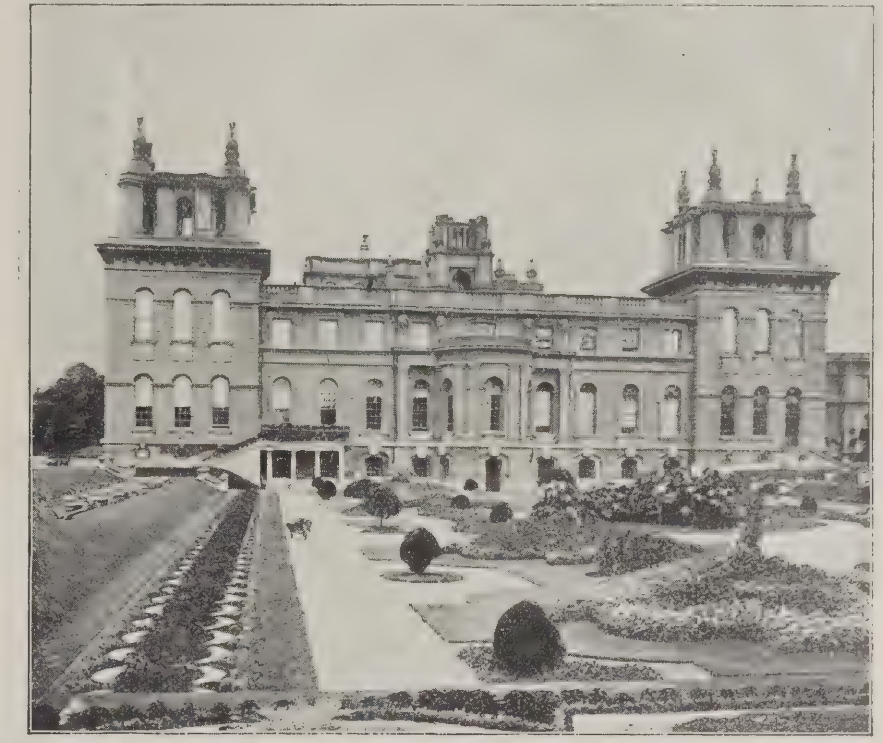
His first known work was Castle Howard in Yorkshire, for Charles, the third Earl of Carlisle. It was begun in 1701 (in the thirty-sixth year of his age), and stands on the site of the ancient Castle of Hinderskelf. The position is by no means a commanding one, but the building supplies any deficiencies in that respect (an illustration of it was published in THE BUILDERS' JOURNAL for April 8th last). In his large buildings he supported the main block with smaller groups of buildings having nearly always a symmetrical plan and elevation. The design is of a simple nature, but may be truly said to be most monumental. The effect of massing shows that he had a great facility in achieving picturesque results. An arcaded forecourt leads to the main block (with a frontage of 300ft.), having on the one side the kitchen offices and outbuildings, and on the other the stable offices, &c., the total frontage being about 650ft. The hall, 35ft. square by about 60ft. high, is treated with columns of the Corinthian and Composite orders, and is surmounted by a dome adorned with a painting by Pilligrini depicting the "Fall of Phæton." The hall has staircases on either side with access to the saloon, and the principal rooms are all *en suite* to the right and left, overlooking the garden. The plan, though crude in many respects, shows a distinct advance on any previous works, and corridors contribute greatly to the privacy of the various apartments. The garden front is treated with a portico of six columns of the Corinthian order, two storeys high in the centre, with pavilions at either end connected by low wings. The south-east end is crowned by a low stone dome. In Vanbrugh's original design a much more effective treatment than the dome is shown, but cost probably debarred it from being adopted. The pavilion at the other end has a pointed roof instead of a dome, which disturbs not a little the rhythm of the façade; this latter was an alteration carried out when this part was rebuilt in 1763. A curious point about the front is that although the pilasters in the centre run up the two storeys, the same treatment is continued in the wings, which are only one storey in height. Vanbrugh had a great objection to the superimposition of the Orders, and this is one of his favourite arrangements—open no doubt to criticism, especially from an archæological point of view. The dome rises to a height of 100ft., and is well proportioned to the rest of the building, forming a very striking feature for miles around. The rooms are all of stately proportions, although some are rather small.

---

* A paper read before the Liverpool and Edinburgh Architectural Societies.

The plasterwork generally in the various chambers is of an elaborate character, and the cornices and ceilings are mostly enriched. Windows were often made to suit the elevation rather than the plan, and the corridors are lit principally from the courts, which light also many of the rooms. The building covers nearly the same ground as Blenheim, but, with the exception of the main block, it is only one storey in height.

The interior shows the same studied treatment as the exterior, and the master-mind may be traced in the uniform breadth of effect. For picturesqueness of grouping and splendour Castle Howard would be difficult to surpass. Vanbrugh had an undoubted facility for making his buildings "sit well," and they always formed a perfect ensemble with the landscape. He also had a great facility for obtaining light and shade, and anticipated effects which had not been tried previously. The straightforward treatment of the chimneys as necessary adjuncts, instead of things to be hidden under balustrades, merits approval, and the general effect of clustered chimneys with the vases and statues which embellish the south front gives a very rich effect to the skyline. Vanbrugh's work is eminently original in comparison with that of Christopher Wren and Inigo Jones. Compared with the "classic copyists" of his time, he deserves some consideration for his inventive faculty and his hardihood in producing work bound to provoke general discussion, and very often abuse. Vanbrugh's style was his own, and though it is sometimes of rather a heavy nature, yet there is a distinct thoroughness and uniformity always noticeable. The majority of critics will admit that his work is most substantial and built for all time.



BLENHEIM PALACE: EAST FRONT.

Vases, statues and carved keystones were the form of sculpture usually employed by him. At Castle Howard the stone has taken on a beautiful colour, which adds not a little to the charm of the building.

In 1702 Vanbrugh succeeded William Talman in the comptrollership of the Board of Works. In 1703 Sir Godfrey Kneller (who also painted his portrait) instructed him to make plans for a house; it was erected near Hounslow. It is now used as a military school of music, but is not designed in his usual style and has no particular interest, though when seen from a distance the general effect is good. It has rather an early Jacobean look.

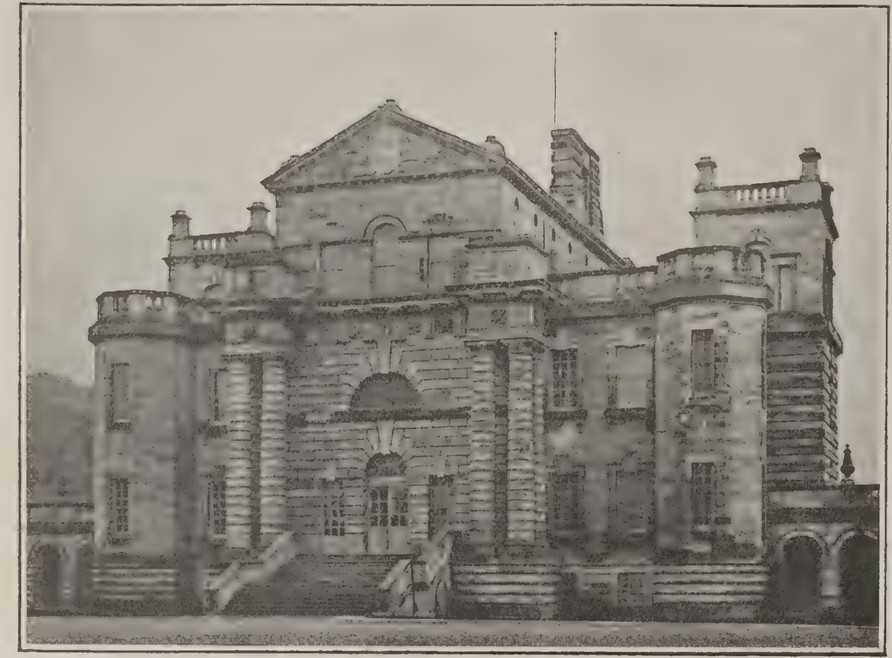
Castle Howard, though begun in 1701, was not finished till 1714. It was regarded with favour by the public, and was also greatly appreciated by the architect's patron, the Earl of Carlisle. The latter having considerable interest as Earl Marshal of England, he presented Vanbrugh with the tabard of Clarencieux King-at-Arms. It was compulsory in accordance with the rules of the College that a king-at-arms should pass through the various grades, and Vanbrugh was appointed Carlisle Herald and promoted Clarencieux a year later (1704).

In 1705 Vanbrugh's own theatre, which he had designed, was opened. It was situated where His Majesty's Theatre now stands, and was a plain building of brick with stone dressings; but the acoustics were seriously defective, as has been already mentioned.

Blenheim.

Castle Howard was the means of his obtaining the post of architect of Blenheim. In June, 1705, Vanbrugh was appointed architect (being forty-one years of age) of the new palace to be built at Woodstock for the Duke of Marlborough, to commemorate his great victory of Blenheim. Parliament appears to have voted a mansion without

TITANIC BRIDGE OVER THE LAKE AT BLENHEIM PALACE. SIR JOHN VANBRUGH, ARCHITECT.



SEATON DELAVAL, NORTHUMBERLAND: ENTRANCE FRONT.
Reproduced, by permission, from Belcher and Macartney's "Later Renaissance Architecture in England," vol. ii.

the necessary funds, but Queen Anne commanded the work to proceed. The first stone was laid by Marlborough himself, the site being near Fair Rosamond's Well in Woodstock Park. The architect wished to retain part of the old manor-house, but was prevented by the Duchess of Marlborough, who was responsible for much of the ill-usage which Vanbrugh subsequently received. By 1710 about £200,000 had been paid towards the erection of the palace, and the Duchess complained of the extravagant nature of the work.

It appears that after Marlborough was recalled from his command things did not go at all well with the building of the palace, and naturally he did not take much interest in a work voted him by those who had wronged him. During the Queen's reign the building proceeded apace. The contractors were not regularly paid, but they did not grumble, as they believed everything would be settled in the end. The Duke himself did not scruple sometimes to meet the demands of the workmen, thinking that all his advances would be made good; but after the death of the Queen in 1714 payment by Government was entirely stopped, and Vanbrugh found himself in a very embarrassing position. He had personally been at considerable expense, and he also found no means of even getting his commission.

"I have the misfortune," he says in a letter to Tonson the bookseller, "of losing, for I now see little hopes of even getting it, near £2,000 due to me for many years' service, plague and trouble at Blenheim, which that wicked old woman of Marlborough is so far from paying me that the Duke, being sued by some of the workmen for work done there, she has turned the due to them upon me, for which I think she ought to be hanged." In another letter he says: "I have prevailed with Sir R. Walpole to help me in a scheme by which I have got my money in spite of the hussey's teeth. My carrying this point enrages her much, and the more so because it is of considerable weight in my small fortune, which she has heartily endeavoured so to destroy as to throw me into an English Bastille there to finish my days." This was in 1725, about a year before his death. Vanbrugh had not been employed latterly on Blenheim, but it was finished in accordance with his design about the year 1724.

The plan of Blenheim is simpler than Castle Howard, being a main block connected by colonnades with projecting quadrangular wings. The forecourt is treated in a most impressive and monumental manner, and the view from the entrance-gateway towards the house, having the kitchen court on the one side and the stable court on the other, is very fine. The same general arrangement of plan is followed, though simpler, as at Castle Howard, the staircases being on either side of the hall and the principal apartments (state rooms) to the right and left of the saloon overlooking the lawn, with the well-wooded park stretching away in the distance. The hall, 71ft. by 44ft. by 67ft. high, with domed ceiling, is decorated with an allegorical painting of the battle of Blenheim, by Sir James Thornhill (who also painted the cupola of St. Paul's Cathedral, and had great difficulty in getting his fees, receiving only 40s. per sq. yd. for his work). The walls have painted panels by Laguerre illustrative of the various nations. The state apartments are very finely treated, and are hung with beautiful tapestry depicting the various battles and victories of the Duke. The great gallery, or library rather, is 182ft. long, with an organ occupying the bay in the centre. The main block has a frontage to the south of 320ft.; the total frontage being about 856ft. The towers show a distinct falling off in detail as compared with the rest of the buildings, and they lose their bold quality, traceable no doubt to Vanbrugh's services being dispensed with before they were built. The Titanic Bridge of 100ft. span over the lake is a very massive piece of architecture, and is not without beauty; it is really more ornamental than useful. One would expect a splendid entrance to the park, but it is a disappointing one, being of a rather paltry nature and out of keeping with the scale of the mansion. It may be mentioned that the palace cost £300,000, inclusive of £60,000 spent by Marlborough alone—who, as a matter of fact, died without having really occupied the building.

Blenheim is generally supposed to be the most magnificent home in England. It is within easy access of Oxford, and is open to the public on several days of the week. The situation and surroundings are exceptional, and the park, which contains trees more than 500 years old, is of great beauty and considerable extent.

Sir Uredale Price says of Blenheim: "It appears to me that Vanbrugh conceived and executed a very bold and difficult design, that of uniting in one building the beauty and magnificence of the Grecian architecture, the picturesqueness of the Gothic and the massive grandeur of a castle, and that in spite of many faults for which he was justly reproached he has formed in a style truly his own, a well-conceived whole, a mansion worthy of a great prince and a great warrior."

Vanbrugh's Later Works.

After his appointment as architect of Blenheim he was busily employed on various large buildings, principally mansions for the nobility. In 1711 he built the Clarendon Building, Oxford, in collaboration with Nicholas Hawkesmoor. This is chiefly notable for the bold treatment adopted, and is nothing short of masterly, especially the mouldings and details generally. It is thoroughly typical, and is a fair example of his manner of obtaining a monumental effect in a comparatively small building.

GROUND-FLOOR PLAN OF SEATON DELAVAL, NORTHUMBERLAND. DRAWN BY A. STRATTON.
Reproduced, by permission, from Belcher and Macartney's "Later Renaissance Architecture in England," vol. ii.
(B. T. Batsford).

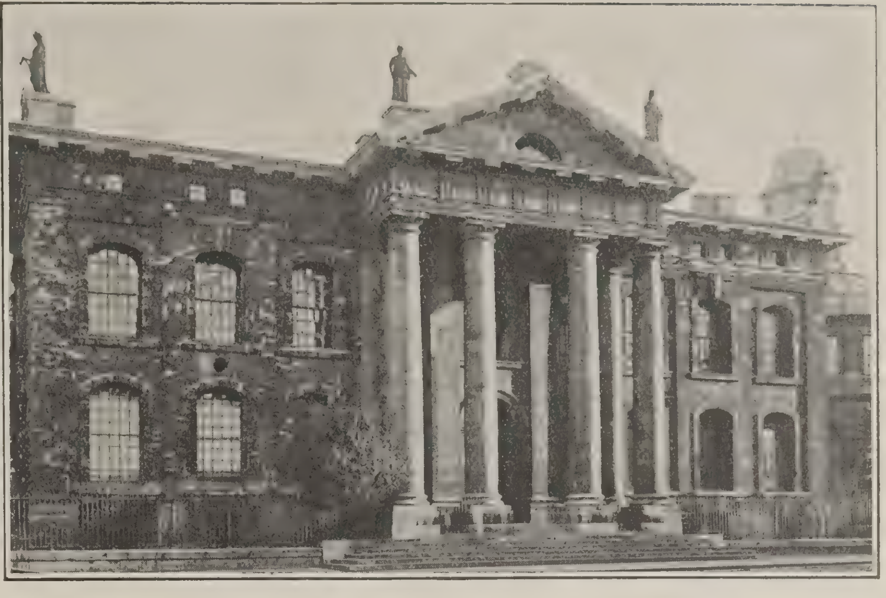
In 1713 he designed Kings Weston, in Gloucestershire, for the Right Hon. Edward Southwell. The plan follows the usual lines, but the exterior is somewhat marred by a line of chimneys treated as an arcade, with detached pedestals above the piers. The hall is 36ft. by 29ft. and 30ft. high, rising two storeys. The whole building is a good example of his powers of design.

In 1714 Vanbrugh was knighted by the new sovereign, George the First, in recognition of his many public services. In 1715 he was reappointed Comptroller to the Board of Works, and shortly afterwards was given the post of architect to Greenwich Hospital.

He built Eastbury, Dorsetshire, in 1716 for the Right Hon. George Doddington, but unfortunately it was pulled down thirty-four years later by the first Earl Temple. It had a front, inclusive of offices, of 370ft., and shows as regards planning that he was steadily improving. The columns (3ft. in diameter) adorning the entrance front were supposed to be the most magnificent in England. It may be observed that his stairs are nearly always in straight flights, and the rooms generally are always well lit and of pleasing proportions. The garden and plantation was laid out on a geometrical plan, and the temple placed at the garden end, facing the house, was a very imposing production, partly no doubt owing to its great size (50ft. by 30ft.). It shows more refinement and leaning to the Italian forms than most of his work.

Oulton Hall, Cheshire, was built about the same time as the above, but possesses no particular interest; moreover, it has been much altered.

His next work, Floors Castle, near Kelso, was built for the Duke of Roxburghe in 1718, but as it was considered of too severe a nature it was altered in 1849, and is now a mansion in the Tudor style.



THE CLARENDON BUILDING OXFORD: NORTH FRONT.

Seaton Delaval, in Northumberland, is situated about eight miles from Newcastle-on-Tyne, and was designed about 1720 for Mr. Delaval. It is approached by an arcaded forecourt 180ft. by 152ft., balanced on the one side by the kitchen wing and outbuildings, and on the other by the stable, offices, &c. Like most of his buildings, this is of a symmetrical character, the house being practically square with octagonal turrets at the corners. The hall is entered from a really splendidly designed portico, and is 44ft. by 25ft. by 30ft. high, with a hanging gallery in stone at one end. Seaton Delaval shows that Vanbrugh was continually advancing in mastery of his art; the details are much more refined, the planning shows more merit, and the rooms, compared with the size of the house, are much larger than he was wont to make them. The stonework is very well wrought, but unfortunately most of the sculpture is gone, the house having been burnt down in 1752. It may be remarked that the south fronts of his buildings were always treated in a more graceful manner than his north façades, which were severe and stately. At the first glance Seaton Delaval is quite unlike what a dwelling-house should be, and one instinctively wonders if the plan is sacrificed to external effects. But after a study of the latter this idea is dispelled, and we return to the elevation with not a litte admiration for the very telling effect produced. The north front is without doubt a very fine composition. The corner towers and the massive chimney heads appear to form the climax of the design, welding it into a perfect whole. This may be taken as thoroughly representative of Vanbrugh, and being one of his later productions it is devoid of many of the faults of his earlier work.

Grimsthorpe, Lincolnshire, was built in 1722–24 for the Duke of Ancaster. The entrance hall is about the largest in England, being 106ft. by 38ft. by 40ft. in height, with staircases at either end. The proportions are much better than at Blenheim or Castle Howard. It it chiefly notable for its rusticated columns $3\frac{1}{2}$ft. in diameter and the very large key blocks used. The main front is very fine, and the columns (rusticated Doric) are similar to those at Seaton Delaval. This was his last important work, and it is only regrettable that he executed such large works in the early part of his career, his later works showing such improvements on his earlier productions.

Vanbrugh was architect of many other buildings of a smaller nature. On pp. 352 and 353 are reproductions of one at Oxford. It is a private residence treated in an extremely bold and masterly fashion. The pilasters running up two storeys is a daring piece of work for such a small building. The result, I think, justified the experiment. The windows have an in-go of 9in., and the lintels have flat arches, owing doubtless to the soft nature of the stone, as a lintel in one stone would be liable to crack.

In 1710, at York (being about forty-five years of age), Vanbrugh married Henrietta Maria, eldest daughter of Col. Yarburgh, of the Foot Guards, and of Snaith Hall, Yorks, his wife being twenty years younger. Lady Mary Montague in one of her letters, and with the youthful ardour of nineteen years, refers to the lady as a "ruin," and she also calls attention to Vanbrugh's steady attendance at all the assemblies. He passed the rest of his life in comparative affluence, and during his comptrollership built for himself a house at Whitehall which was his official residence. The house was taken down as recently as 1898, being for some time occupied as the United Service Institution. It was likened by Swift to a "goose-pie"—however, the "goose-pie" survived 200 years without mishap.

Besides his town house he had two at Blackheath, which are still standing. The "Bastille," on Maze Hill, was probably named from his early association with the place of that name. It is now used as a girls' boarding school. The other house stands on ground known as "Vanbrugh fields."

Extend
The Elevation of One End of a New Deſign for a perſon of Quality in Dorſetſhire as Deſigned by Sr John Vanbrugh Kt

He often resided in Berkshire, near his old friend Tonson, in a letter to whom he says: "I have always found a *tête-à-tête* more pleasing with you there (in Berkshire) than I should have done at Blenheim had the house been my own, though without my Lady Marlborough for my wife in it. For one may find a good deal of pleasure in building a palace for another, when one should find very little in living in it one's self. . . . . . I have likewise had a very hard disappointment in not being made Surveyor of the Works, which I might have had formerly, but refused it out of tenderness to Sir Christopher Wren."

It is interesting to observe that when Blenheim was finished the Duchess refused to admit him to look at his own work, when he was with friends from Castle Howard—his friends were admitted, but he was excluded. "We stayed two nights in Woodstock," he says in a letter, "but there was an order under her Grace's own hand to the servants not to let us enter Blenheim Park."

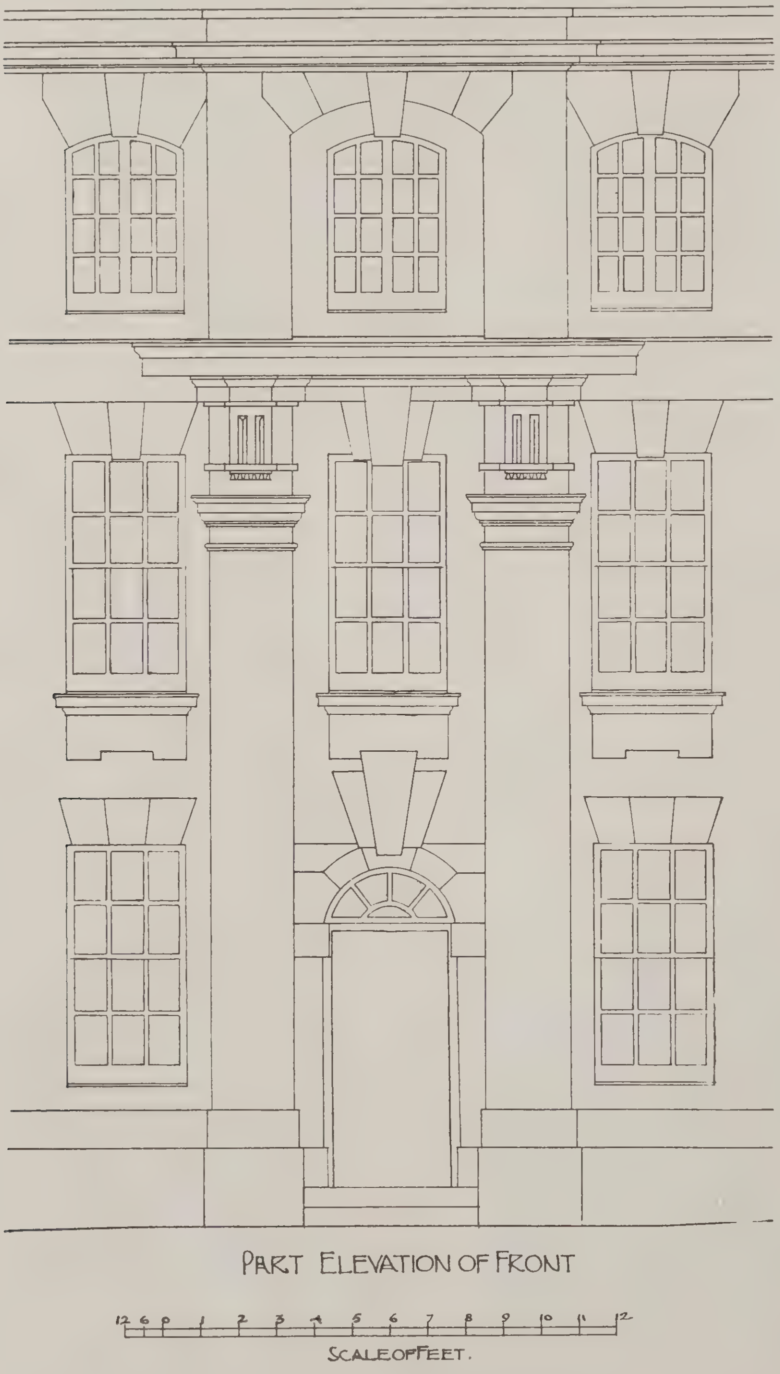
Vanbrugh died of quinsy on March 26th, 1726, at his town house, in his sixty-second year, and was buried in the Vanbrugh vault in St. Stephen's, Walbrook. Lady Vanbrugh survived her husband fifty years. Charles Vanbrugh, their only son, was educated at home and in Switzerland, and afterwards obtained an ensigncy in the Coldstream Guards. He served with his regiment in Flanders, and in 1744 died of wounds received in battle near Tournai.

In Pope and Swift's joint miscellanies of 1727 they apologised and expressed their regret for their raillery, "though ever so tender had ever been indulged, against a man of wit and humour."

The only thing which survived all Dr. Evans's writings and even his name is the famous couplet beginning—

> Under this stone, reader, survey
> Dead Sir John Vanbrugh's house of clay;
> Lie heavy on him, earth! for he
> Laid many heavy loads on thee!

Vanbrugh may, I think, be considered as the greatest architect of the reigns of Queen Anne and George I. His later designs for buildings and writings for the stage showed that his powers remained as fine as ever to the end.



HOUSE AT OXFORD. SIR JOHN VANBRUGH, ARCHITECT.

THE BUILDING TRADE IN SOUTH AFRICA.

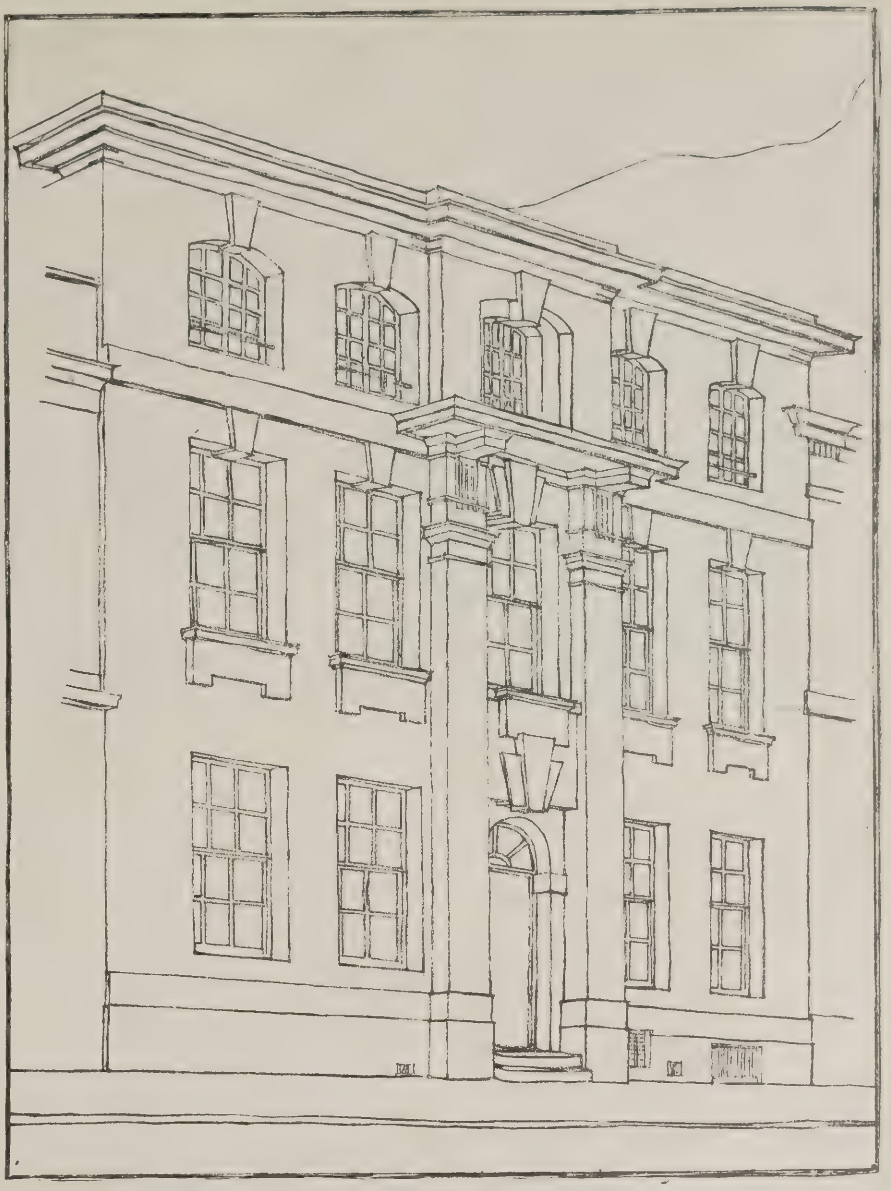
WHILE several statements have appeared in home papers pointing out the shortage of workmen which the building trade in Cape Town, Durban and Johannesburg has been experiencing, so far little notice has been taken of the needs of Port Elizabeth. We have therefore been requested to publish the following communication:—

In common with the rest of South Africa the building trade in Port Elizabeth is extremely brisk, despite the great and increasing advance in the cost of labour and the difficulty in obtaining good men. All the builders in the town have their hands full of work—so much so, in fact, that architects have the greatest difficulty in obtaining tenders for contemplated buildings; for jobs of any size or importance an average number of tenders is about three or four, whilst the time required by the tenderers for completion of works is fully one-third more than was formerly the case, and the price nearly double.

A number of large buildings are now in course of erection or completion in the town, including the new premises for the Bank of Africa, a terra-cotta building of which Mr. W. H. Stucke, of Johannesburg, is the architect; a seven-storey building in Main Street for Messrs. Cuthbert, of which Messrs. Hubert Walker & Tomlinson are the architects; a large block of residential chambers and shops facing the Donkin Reserve; a three-storey island block of warehouses for the Harbour Commissioners, and the new administrative offices for the same body (Messrs. Victor T. Jones and W. J. McWilliams being the architects for the three latter); as well as numerous other warehouses and buildings of a less important character; while the erection of several "skyscrapers" is also contemplated.

The projected scheme of the Harbour Board for a new harbour and wharves on a huge scale at the mouth of the Zwartkops River will undoubtedly cause a demand for new warehouses, &c., in that quarter of the town, and in general the prospects of the trade in Port Elizabeth are extremely good if labour can only be procured in sufficient quantity to enable work to go on in a more rapid and economical manner. The increase in the wages of workmen owing to their scarcity is of course the principal factor in the present high prices of building work. Whereas in June last year carpenters were asking 1s 5d. and bricklayers 1s. 4d. per hour, in the same month this year carpenters were obtaining 2s. 3d. and bricklayers 2s. and 2s. 1d., many being only half-competent men at that. Bricklaying is largely in the hands of the Malays, although lately a few London and Australian bricklayers have been specially brought out by the contractors for two of the largest jobs. The permanent barracks and camps being built up country for the military authorities have drained the coast towns of men, as much as 2s. 6d. an hour being paid to carpenters by the contractors for these works; indeed, when tendering for work in Port Elizabeth builders are already allowing for a probable increase in prices to that extent. That this town is worse off for workmen than either Cape Town or Durban is due to the fact that no line of steamers sails direct to it, while men coming to the country leave the boat usually at the first port of arrival, generally with the idea of proceeding to the Rand. Workmen who contemplate emigrating to South Africa could not do better, therefore, than to make for Port Elizabeth, any respectable man being certain of employment at good wages, while the cost of living, compared with that of other South African towns, is fairly moderate. Contractors with a little capital would also probably do well, as those now in the town are almost overburdened with work.

Builders' Notes.



HOUSE AT OXFORD. SIR JOHN VANBRUGH, ARCHITECT.

The Additions to the Borough Sanatorium, Sunderland, are being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, those previously supplied having proved satisfactory.

New Electric Cranes at Dover.—In connection with the improvements at the port of Dover for shortening the cross-channel passage two new electric cranes have just been installed. These cranes, the equipment of which has cost £11,000, are exceptionally large and powerful, and have been constructed to the design of Sir William Preece and Messrs. Siemens.

Standardization, which has recently come to the fore in connection with steel sections, is not so very unusual a thing. Of the standardization of screw threads everybody has heard, but perhaps all do not know that the ladder is "standardized." Every hodmen in England knows what he has to step when toiling up the builder's ladder, though he may not know it is 7in. The sailor who runs up the ratlines has 12in. as a step, and that makes a run possible. And the firemen's ladder is crossed with exact equivalence to the ratlines, for firemen are generally sailors.

Education for Plumbers.—A "Report on the Working of Plumbers' Classes" has been published by the Lancashire County Council, which affords an example of a systematic and successful attempt at technical instruction in a particular industry carried out on a practical basis for a series of years. The National Association of Master Plumbers has adopted a form of indenture for apprentices, containing covenants requiring the apprentices to attend evening courses of technical instruction and to present themselves for examination annually, with a view to ultimately qualify for registration. Under this form of indenture the ordinary term of seven years may be reduced to five years, provided the apprentice has previously pursued his education to fit him for his trade at a technical school, on conditions varying according to localities.

Opening up East London.—A communication having been received by the officials of Stepney Borough from the Royal Commission on London Traffic as to how congestion in the traffic in the district could best be mitigated, the borough engineer, Mr. W. M. Jameson, has prepared and forwarded a report, in which he points out that one of the sources of congestion is the passing over of the tramcars at the Aldgate terminus. Another source of trouble is the Jews' market in Middlesex Street, which is the nearest 'bus route from the south of London to Liverpool Street Station. The engineer suggests that Commercial Road in the vicinity of Britannia Bridge should be widened, that roads leading to the docks and wharves should be widened, that the East London Railway Company should be called on to electrify their line and provide hydraulic lifts at their stations, that the dock companies should be requested to modernize their swing bridges, which are at present a great source of obstruction to traffic, and that Cable Street and adjacent streets should be widened so as to allow tramways to be laid along them.

London County Council.—At last week's meeting of the Council Lord Rosebery's proposal for further provision in London for advanced technological teaching and research was approved and a grant of £20,000 a year agreed to.—It was decided to appropriate, at a cost of £30,000, a site in Southampton Row for the proposed London Day Training College. This site is next to that already allocated for the Central School of Arts and Crafts.—It was decided that the Council should seek power next session to construct new tramways of a total length of about 29½ miles, and the doubling and reconstruction of existing tramways of a total length of 3¾ miles, at an estimated cost of about £1,580,325. Amongst the tramways proposed are lines from Hampstead Road, along Tottenham Court Road, to Oxford Street; from Westminster Bridge Road, *via* Victoria Embankment, to the north side of the Strand; from the Marble Arch to Cricklewood; and through the Blackwall Tunnel.—The Council passed an estimate of £4,250 for the annual repair of the Victoria Embankment. The work is to occupy not less than a month, and is to be carried on night and day, Sundays as well as week-days.

Norwegian Slate.—The importation of Norwegian granite into Aberdeen is now a well-established trade; but the resources of Norway are being still further developed, and Aberdeen will to some extent reap the benefit of this; for the sole agency in Scotland for a Norwegian slate which, it is contended, is superior in every respect to the Welsh slate has been secured for Aberdeen by Mr. Alexander Murray, of King Street, and Mr. Charles Maitland, of Union Grove. The slates, which are obtained from a quarry at Voss, are of two colours, green and grey. On the Vossebygden there are whole mountains of slates, quite sufficient to slate every house in Norway and leave an abundant supply for export. In spite of this, however, it is not many years since Norway imported considerable quantities of slates from the quarries in Wales, not knowing that there was such a plentiful supply at hand until Mr. Christensen commenced the development of the quarries on the Vossebygden. Cargoes are shipped from Bergen. The distance from Bergen to Aberdeen is only about half that from Port Dinorwic to Aberdeen; and although the Norwegian slates have at present to be conveyed eighty miles by rail to Bergen, a new pier which is to be constructed at another part of the coast will lessen the railway journey by half, thus reducing the cost of transit.

Messrs. G. B. Kent & Sons, Ltd., of 75, Farringdon Road, London, E.C., have been established for more than a century and a quarter, and are among the most respected of firms. Their reputation, however, is not based merely on length of years, but on the reliability of the brushes they make. The new catalogue of the firm, now before us, comprises all kinds of brushes, exclusive of painters' brushes, which are dealt with in a special catalogue.

Change of Address. — Owing to an extensive fire that occurred at their late premises at Regent's Park, Messrs. G. R. McKenzie & Co., Ltd., timber merchants, shop and office fitters, &c., are transferring their business to a more commodious building at Queen's Road Station, Battersea, London, S.W. These works, besides being much larger, will be fitted with the latest up-to-date machinery and appliances, which will enable Messrs. McKenzie to execute all orders with the utmost promptitude.

CULTON HALL CHESHIRE.

Enquiries Answered.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters. Questions should in all cases be addressed to the Editor. The querist's name and address must always be given, not necessarily for publication.

Enforcing Detailed Account of Street Works.

BURY.—R. G. R. writes: "Can one enforce a detailed account from an urban district council for private street improvements after the receipt of the final apportionment? Works carried out under the 150th section of P.H.A. 1875"

We are of opinion that under ordinary circumstances you cannot. T. E. C.

Ancient Lights.

DEVONPORT.—E. M. L. writes: "I should be glad of an opinion on the right of light on the accompanying plan (not reproduced). My client desires to raise a new building above an old building, as shown."

It would be well to come to terms with the adjoining owner, whose right of light would be undoubtedly interfered with by the proposed addition. In the event of an action being contested he might not secure very heavy damages, but he could give a great deal of trouble, and might even obtain an injunction against the proposed building at some awkward moment. G. A. T. M.

Comparative Cost of Floors.

LONDON, S.E.—SUBSCRIBER writes: "What is the approximate difference in cost per square between a floor composed of rolled steel joists and concrete 8in. thick finished with an even surface, and a floor composed of red deal joists, binders and 1½in. floorboards? The floor in each case has to carry the same weight."

A concrete floor with steel joists would probably cost about one-third more than a wooden floor for the same span and weight-carrying capacity. T. E. C.

London Buildings.

BRISTOL.—PROV. PROB. writes: "I purpose to spend a few days in London next month. What buildings and museums would be most profitable to visit in preparation for the R.I.B.A. intermediate examination? How is admission obtained to the Architectural Museum, and is it still in Tufton Street?"

You should, of course, visit St. Paul's Cathedral and Westminster Abbey, some of the City churches—such as St. Stephen's, Walbrook—St. Mary-le-Strand, Somerset House (from the inner court as well as from the Strand), the National Gallery, the Houses of Parliament and similar well-known buildings; and it would be good for you to take special note of modern work, such as New Scotland Yard, Westminster Cathedral (which is close to Victoria Station), the Imperial Institute at South Kensington, &c. In a few days you cannot expect to do more than just see the main parts of these buildings. As to museums, the architectural and sculptural fragments in the British Museum should of necessity be seen, and you will also find it of advantage to visit South Kensington Museum, the Soane Museum in Lincoln's Inn Fields (open free from 11 to 5 on Tuesdays, Wednesdays, Thursdays and Fridays during March, April, May, June, July and August), the Museum of Practical Geology in Jermyn Street (10 to 5), Parke's Museum at the Sanitary Institute, 74A, Margaret Street, Regent Street, W. (10 to 6), and the architectural courts at the Crystal Palace. The Royal Architectural Museum is still at 18, Tufton Street, Westminster, S.W., but it is now closed whilst the alterations to the building preparatory to its use by the Architectural Association are being carried out under the direction of Mr. Leonard Stokes, F.R.I.B.A. It will not be re-opened to the public till next April. Hitherto it was open from 10 to 4.

Duplicating.

LLANGOLLEN.—X. X. writes: "Which is the best copying process for quantities, specifications, &c.?—one requiring no expert knowledge, and reasonable in price."

There are many duplicating systems on the market. A very simple one is the hectograph, consisting of a slab for the most part of gelatine, on which the writing (in strong aniline ink) is impressed. Soak ½lb. of gelatine in water till it is flaccid, melt in a water-bath with some common glycerine, heat for an hour or so to drive off all excess of water, then pour into trays ½in. deep. To take copies it is only necessary to lay the sheets on the surface and press them down evenly. Similar results are obtainable with a putty-like composition. Only a limited number of copies, however, can be obtained—say twenty-five. For large numbers of copies a duplicator like the "Neo-Cyclostyle" could be used. Sun-prints on blue paper might also be taken, writing the original on thin tracing paper. Lithography is the most satisfactory process, but considerably more expensive. Printing is, of course, more expensive still, unless a very large number of copies is required.

Cubing Library Building.

SALISBURY.—CYMRO writes: "What would be a reasonable price to cube a library building costing about £4,000 (1) with fittings, (2) without fittings?"

(1) 6d. (2) 8d.

Penalties against Contractor.

CARDIFF.—LIGHT writes: "If, without just cause, a contractor is much over his time in completing a contract, and it is decided to enforce the penalty, should the amount of the architect's final certificate be less the amount of the penalty, or should the architect certify in full and state on the certificate that the amount is subject to the deduction, by the building owner, of the amount of the penalty? The form of contract and conditions is the R.I.B.A. form."

The architect is the agent of the client and is therefore entitled, if he receives instructions from the client, to grant a certificate for the amount due, *i.e.*, with the penalty deducted.

Guaranteeing Accuracy of Quantities.

SOUTH DEVON.—WATERWORKS writes: "I prepared drawings and quantities for a proposed water scheme for a public body, but unfortunately the relations between the chairman and myself are somewhat strained. A friend has suggested that probably it would be more satisfactory for all concerned if the public body paid me an agreed sum of money for what I have done, and employed someone else to carry out the scheme, making use of my drawings and quantities. The chairman is agreeable on condition that I guarantee the accuracy of the quantities. Should I be justified in doing so?"

You would be most unwise to guarantee the accuracy of the bill of quantities, for it is impossible to be quite sure, and any slight variation could then be charged to you. You can, of course, assure them that the quantities are correct to the best of your knowledge and belief, but they have their remedy without any guarantee in being able to prosecute you if they desire for culpable negligence or fraud.

Broken Contracts.

MERE.—J. H. writes: "I drew up a set of plans and specifications for taking down some old premises, which were accepted, and afterwards gave a contract, which was also accepted. An agreement was drawn up. After work had been in progress about three weeks someone else made another set of plans and specifications, and I was asked to give a price for mine. Eventually I was thrown over. What is my position? Can I claim payment in full?"

You can undoubtedly sue for the full amount of the contract if the facts are as you state.

Buildings to Measure around Wakefield.

WAKEFIELD.—J. D. writes: "Please name some buildings within twelve or fifteen miles of Wakefield suitable to measure for the Intermediate Examination of the R.I.B.A."

There is a fine Norman church at Wragley, about five miles from Wakefield. The parish church of Wakefield is a very fine example of Perpendicular work, and on the bridge across the Calder is a good Perpendicular chapel. At Roystone, about six miles from Wakefield, is a very interesting church (Decorated and Perpendicular) erected by the monks of the Cluniac Priory of Monk Bretton. There is an almost perfect list of vicars of Roystone from 1234, when Richard de Wallington was instituted on the presentation of the prior. The church has a very peculiar feature, of which only one other is supposed to exist in England, viz., a chamber with an oriel window half-way up the tower on the west side. It was probably made either to hold a light as a beacon for the guidance of the monks from the monastery to the church or for reading and meditation. There are some well-preserved frescoes over the chancel arch, and a singular monument to Sandford Nevile, 1172. At Monk Bretton, nine miles from Wakefield, there are a few remains of a Cluniac priory with a good Perpendicular gatehouse. Darfield Church is well worth a visit on account of its details (Decorated and Early English), especially the Decorated tracery of the south aisle and clearstory windows. M.

Removing Whitewash on Walling.

COCKERMOUTH.—W. R. S. writes: "How should old whitewash be removed from ordinary hammer-dressed rubble walling?"

Scrape off as much of the whitewash as possible with iron tools, and then use stiff wire brushes with water to remove practically all the remainder. The last traces can be removed by brushing with a weak solution of hydrochloric acid and washing down with clean water.

"Points."

CLOUNE.—BUILDER writes: "I have seen the word 'point' used as a technical term denoting a certain quantity of gas-pipe fixed in houses. What quantity does it represent?"

The term "point," used by gasfitters, merely applies to a point of light, *i.e.*, one burner. It does not represent any fixed quantity of work, but varies according to circumstances. In an ordinary house the amount of gas-pipe does not vary very considerably, nor the labour of fixing. The estimate given you was an all-round sum for the work.

Underground Conveniences.

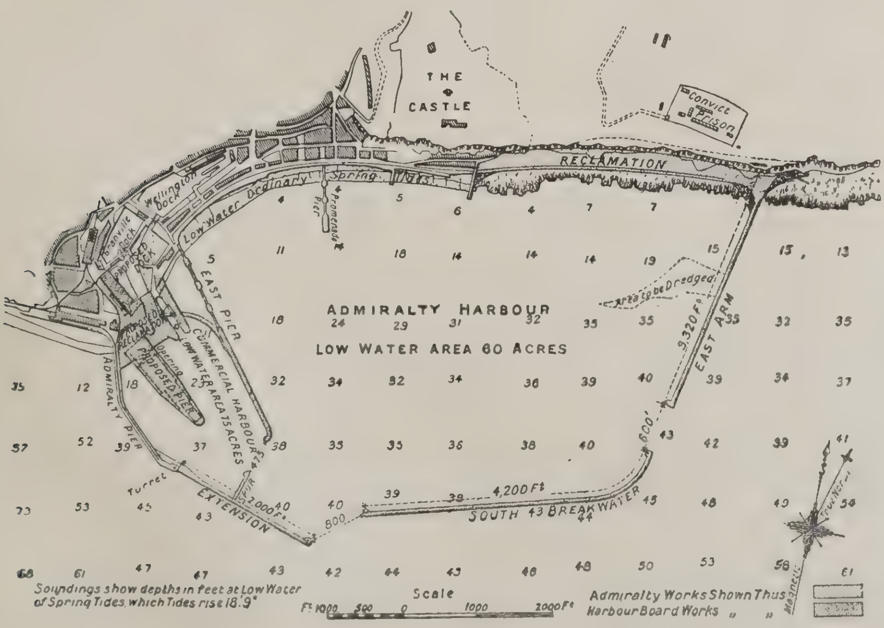
BLACKPOOL.—JARRAH writes: "I am designing some underground conveniences, and desire to know the best method to adopt for floor and ceilings. I think of having a flat ceiling, the steel joists to be encased with and to have 3in. of cement-concrete on the underside, floated smooth and covered with 6in. by 3in. tiles. Would the latter require to be in rebated wood frames in panels, and would the 3in. of concrete casing require strengthening in any way? Do you recommend wire-mesh lathing instead? What are the advantages of trough girders over ordinary steel sections, and what form of trough would you advise?"

The soffit of the concrete should be rendered with a thin coat of lime-putty and afterwards painted. Covering the ceiling with tiles is expensive, and no corresponding advantage would be obtained. Where steel trough decking is adopted, no cross joists are required between the main girders. It is easily erected, forms a water-tight floor of great strength and stiffness, and frequently saves valuable head-room underneath. The particular section of trough decking required must depend on the span and weight to be carried; this, however, can be readily ascertained by referring to the catalogues issued by Messrs. Dorman, Long & Co. (Middlesbrough) and other well-known makers. If necessary, the concrete casing may be strengthened by embedding expanded steel lathing or other similar material within it. A large amount of information, together with detail drawings showing the general construction of underground conveniences, will be found in "Specification" No. 6 (price 5s.), published at these offices. T. E. C.

THE DOVER HARBOUR WORKS.

ON Wednesday last the Society of Engineers visited the works of the new Admiralty harbour at Dover, which were inspected under the guidance of Messrs. Coode, Son & Matthews, the engineers, and Messrs. S. Pearson & Son, Ltd., the contractors.

The nucleus of the present work is the old Admiralty pier, which was completed in 1871 and is 2,000ft. long. In 1895 it was decided (1) that the Admiralty pier should be extended 2,000ft. in an east-south-easterly direction, practically doubling its length; (2) that an east arm commencing a few hundred feet to the east of the eastern boundary wall of the convict prison should be run in a direction approximately south by west for a distance of 3,320ft.; and (3) that an isolated breakwater 4,200ft. in length should run generally west by south and east by north, but turning towards the north at its eastern end, and should form the southern protecting arm. The accompanying plan shows this. The contract for the construction of the harbour was let in 1897 to Messrs. S. Pearson & Son. The total length of the sheltering works to be constructed is 9,520ft. At the present time the Admiralty pier extension and the east arm are nearing completion, and work is just about to be commenced on the southern breakwater. In carrying out this important and interesting undertaking a temporary yard was first formed on the beach in front of the S.E.R. town station. The blocks for the reclamation wall were built at Sandwich, where a large quantity of mixed sand and shingle was obtained. Originally these blocks were brought from Sandwich in lighters, but later a light railway was built, by which they were delivered into the yard direct. Since the reclamation wall was finished the area enclosed by it has been utilized as a block-making yard for the east arm and south breakwater, the ground having been made up by material scraped from the cliffs. Ballast brought from Sandwich by the light railway is lowered down on to electrically-worked gantries running on rails parallel with the cliffs. Cement is also lifted on to these gantries, and the process of making the concrete for the blocks for the east arm is carried on by means of mixers as the gantries move towards the block moulds. For the construction of the masonry breakwaters a grab worked from a powerful goliath crane removes all the loose material overlying the chalk. Another goliath manipulates an exceptionally large diving bell, by means of which the excavation and the levelling of the chalk bed are effected. This part of the work is very heavy, as no block is allowed to be set at a less depth than 3ft. below the surface of the solid chalk. Above water-level they are faced with granite. They vary in weight from 10 to 40 tons, the latter being the size most frequently used. Below low water they are set without mortar, but are well bonded and keyed together by joggles inserted into recesses cored out at the time the blocks are moulded. About low water the blocks are set in Portland cement-mortar and are also keyed with joggles. The estimated cost of the whole work is about £3,500,000.



PLAN OF THE DOVER HARBOUR WORKS, NOW BEING CARRIED OUT.

Keystones.

Liverpool Cathedral.—Lord Salisbury has contributed £1,000 to the fund for the erection of Liverpool Cathedral.

The City of London Corporation have decided to support the suggested setting back of the roadway of the Strand in the L.C.C.'s improvement scheme.

A new Church at Foubridge, Colne, Lancashire, is being erected from designs by Mr. R. Bassnett Preston, A.R.I.B.A., of Manchester.

Three new Board Schools were opened last week in Plumstead. One in Bostall Lane is to accommodate 1,000 children, one in Wickham Lane 600, and one in Church Manorway 900.

The Extension of Camberwell Infirmary, comprising a large block of buildings costing about £200,000, was opened on Friday last. Mr. Edwin T. Hall, F.R.I.B.A., is the architect.

The Royal Victoria Hospital, Belfast, of which Messrs. Henman & Cooper are the architects, was opened on Monday by Their Majesties the King and Queen. The building was illustrated and described in our issue for May 15th, 1901.

A new Board School at Clapham, in the Aristotle Road, Bedford Road, to be called the Haselrigge Road Senior Girls' School, has been erected. There is accommodation for 450 pupils. This is the first school under the Board erected entirely for senior girls.

The Fulham Park Extension was opened recently. It comprises 8 acres 11 roods. The retaining wall built alongside the Thames has cost about £8,000. The whole of the works of design, construction and supervision have been carried out by the borough engineer, Mr F. Wood, A.M.I.C.E.

Radley College.—It is contemplated shortly to enlarge the schoolroom and library at Radley College, Abingdon, from the designs and under the superintendence of the architect for the new wing, Mr. A. H. Ryan-Tenison, F.R.I.B.A., 12, Little College Street, Westminster, S.W.

Mr. W. H. Richards has been appointed principal of the L.C.C. Brixton Technical Institute, which will be opened next session and is intended to be an important centre for instruction in the building trades. Mr. Richards has had wide experience both in practical building work and in teaching building trade subjects.

British Association of Waterworks Engineers.—The eighth annual meeting of this Association was held last week at Bolton. In the course of his address the president (Mr. Robert H. Swindlehurst, M.I.C.E., waterworks engineer, Bolton) referred to the growth of the Association, which has now a total membership of 286. Alluding to water supply, he remarked that while natural filtration through permeable strata was best when it could be obtained, for artificial filtration on a large scale experience had taught them that sand filters formed the most effective means. On Wednesday the Association adopted the final report of the committee appointed to consider the question of the standardization of cast-iron pipes in order to secure the universal adoption of any given standard. The committee reported that it would be desirable to limit the number of sizes standardized to those in common use in this country, the number of classes for each size to be three or less. They did not consider that the metric system of measurement could be conveniently adopted. In their opinion, the next step to be taken was to refer the the whole matter, including their own suggestions, to the Engineering Standards Committee.

Restoration of Rochester Cathedral.—Mr. T. H. Foord, of Acorn House, Rochester, has given £5,000 towards the restoration of Rochester Cathedral, making one stipulation that local builders shall be employed to carry out the work.

A new Convalescent Home at Swansea has been erected in connection with the hospital. Mr. Glendinning Moxham, of Swansea, is the architect. The cost has been about £13,000. The work was carried out by Mr. Griffith Davies.

As a Memorial to the late Dean Farrar, it is proposed to carry into effect his design for filling the west window of the chapter-house of Canterbury Cathedral with coloured glass to match the east window, and to complete certain details in the restoration of the chapter-house.

The Newport (Mon.) Year-Book has just been published, price 3s. 6d. (Mr. Samuel D. Williams, secretary of the Incorporated Chamber of Commerce, Newport). It contains a number of illustrations of the chief buildings in the town, as well as particulars of local industries and firms.

Court of Common Council.—At last week's meeting some by-laws in regard to the demolition of buildings in the City, together with the suggestions of the R.I.B.A., the Surveyors' Institution and the Institute of Builders, were approved. The Court gave authority to let the contract for lamps and standards for London Bridge, the cost not to exceed £2,500.

The Parish Church of St. Thomas, Wednesfield, destroyed by fire eighteen months ago, has been rebuilt from plans by Mr. Fred. T. Beck, architect and diocesan surveyor, of Wolverhampton, by Messrs. H. Willcock, contractors, of Wolverhampton. All is new except the main walls of the nave and the tower at the west end, which have been repaired and pointed. The opportunity has also been taken for the enlargement of the church by the addition of a chancel. The building is constructed of brick with stone dressings, and the roofs are covered with slates. The choir and clergy stalls and pulpit are executed in fumed oak, and the seating throughout the remainder of the church in pitch-pine. The total cost has been about £5,000.

Obituary.

General Brialmont, the celebrated Belgian military engineer, died in Brussels last week.

The late Mr. Edward Woods, the oldest railway engineer in the country, left property of the total value of £128,012.

Mr. John James Barrow, of Hyde Park Gardens, London, died last week. Deceased was a director of the Staveley Coal and Iron Co.

Mr. William Higson, fifty-six, a well-known builder and contractor of Blackburn, son of the late ex-mayor of the borough, died last week. About six weeks ago Mr. Higson fell downstairs and seriously injured himself.

Mr. Thomas Evans, builder and contractor, of Cardiff, died recently at the age of sixty-one years. He went to Cardiff from Pembrokeshire when the town was practically in its infancy. Mr. Evans was interested in the erection of a number of the principal buildings. Of late, however, he had devoted most of his time to sewerage and general contracting work, principally in the Rhondda Valley.

Mr. Benjamin Ebenezer Nightingale, of Albert Works, Albert Embankment, S.E., who died at Richmond on July 17th, was for forty-eight years an active and prominent member of the building and contracting trade. He was a freeman of the City of London, and at some time president of the Master-Builders' Benevolent Institution, being a member of the London Master-Builders' Association and of the Bricklayers' and Tilers' Guild. He erected the council-chamber of the Guildhall and the Leadenhall Market from designs by Sir Horace Jones, and during his career was employed by many other prominent architects, including the late Mr. Bentley, Sir John Taylor and Mr. Aston Webb.

ARCHAEOLOGISTS IN YORKSHIRE.

THE Royal British Archæological Institute held its annual meeting at York on Tuesday and Wednesday last week. On Tuesday York Minster was visited under the guidance of Mr. J. T. Micklethwaite, the surveyor to Westminster Abbey; and afterwards a visit was paid to St. William's College, the beautiful old building at the east end of the Minster. In the evening a paper was read by Mr. T. M. Fallow on "Yorkshire Plate and Goldsmiths." On Wednesday a visit was paid to Howden Church under the guidance of Mr. John Bilson, F.S.A., F.R.I.B.A.

In dealing with the architecture of the church Mr. Bilson said he would like to call attention to a fact bearing on architectural development, a point somewhat neglected. Up to the middle of the thirteenth century the architecture of England ran parallel to the architecture of France, and he observed that there was a good deal of French influence in the tracery of the windows. It was not an improvement, but it led up to the flowing form which began in 1315. In France that was not reached until a considerably later date. That form in the window tracery was a perfectly English development and led on to what was nicknamed Perpendicular, which was also English. Mr. Bilson said there was evidence that the choir was built before the transepts—not the present choir, but one which preceded it. The walls of the choir alone are standing. The choir which was left unfinished in 1272 could not be the existing choir, the style of which pronounced it to be about thirty years later. The magnificent tower was built by Walter of Skirlaw. School buildings were added to the church later in the fifteenth or early in the sixteenth century, which was interesting to note, because they had been continuously used as a school up to the present day. Mr. Bilson also described the Manor House. The splendid hall of this house was built by Bishop Walter, of Skirlaw, who died in 1406. Afterwards a visit was paid to Wressle Castle, four miles distant from Howden. These ruins, most picturesquely situated on the banks of the Derwent, are very interesting from the fact that they are a fine example of the period of transition from military to domestic architecture. The castle was built in the reign of Richard II., and belonged to the great family of Percy.

Selby Abbey was next visited. Mr. J. T. Micklethwaite, F.S.A. described this building, the one great Benedictine monastery of the North of England which survives as a parochial church. He described the manner in which the monks built their places of worship. They first got ready the portion where service was held—the choir; then built the cloisters or living portion; and then went on to complete the church by building the nave. They regarded the church as the Puritans did their religion, always in need of amendment, and he pointed out the changes of fashion which were to be seen. The Rev. A. G. Tweedie said that in some excavations which were carried on he found the foundations of the Norman choir, which was apsidal with apsidal aisles. In the evening Mr. F. Haverfield, F.S.A., of Oxford, read a paper on "Roman Yorkshire."

Views and Reviews.

Saxon Architecture.

The first of these two volumes is an inflated compilation of facts and suppositions about the religious and social life of Saxon and Norman England. Frankly, the greater portion of it does not interest us much: the early chapters are readable enough and the developments from Roman days are described usefully and authoritatively, but the scores of pages dealing with the conversion of England, the missionary bishops and the constitutional history of the village church form very dry reading in an archæological book. The author first considers the sources and spirit of mediæval art, and then goes into the detail of half-timbered work; he afterwards deals with the Roman settlements, pointing out how some of the more prominent of them perished at the time of the Conquest; how the towns which have endured exhibit about as many Roman survivals in topography and monuments as similar cities on the Continent, thus showing that in architecture and the decorative arts classical models were accessible in abundance to the Teutonic settlers, though they may not have cared to employ them; and how the Saxon conquerors settled neither in Roman towns nor along the Roman lines of communication, but in scattered localities where their descendants seem to have remained ever since. Prof. Brown takes a portion of Northamptonshire as an example of characteristic England, wherein are found for study the finest existing specimen of pre-Conquest building—namely, the Saxon church tower of Earls Barton—and Brixworth Church, of the Roman basilica type, dating originally from the seventh century, ruined by the Danes, and restored and added to in the later Saxon period, "so that it forms on the whole the most instructive monument in the early history of our national architecture." Chapter III. of this first volume is devoted to the castle, the church and the monastery—taking as unit the manor-house of the lord, not fortified ("there are no passages in Anglo-Saxon literature which give us any real ground for believing that the lord's house, or even that of the king, was normally a stronghold"), then the moated mound as representing the second form of the manorial residence—the Saxon aula having been succeeded first by the early Norman wooden domicile on its moated mound of earth, and next by the later Norman fortress of stone—and so on to the private chapel, the village church, the town church, the cathedral, the collegiate church and the monastery.

Passing now to the second volume we find, instead of much discursive matter on by-subjects, a masterly descriptive survey of ecclesiastical architecture in England from the conversion of the Saxons to the time of the Norman Conquest; a survey, not a history, because, as the author observes in his preface, the history of a style cannot be written without some general agreement as to the chronology of its monuments, and such a chronology of Saxon buildings has yet to be established; besides which Prof. Brown argues, though we cannot see why, that a history implies development, "and in Saxon architecture, as in Saxon civilization generally, there is neither continuous progress nor evolution . . . but rather alternations of brilliant periods and times of stagnation or decline."

The opening chapter deals with Roman and Celtic sources of English ecclesiastical building. In the remains of Romano-British work are seen the "opus quadratum" or construction with large squared stones, the rubble concrete faced with small stones (with or without bonding courses of brick), the "opus testaceum" where the outer skin is of brick, the plain wall of irregular stonework, and, finally, the light partition of woodwork and plaster. A peculiarity of the large squared stones of Roman workmanship is the tooling, the face being scored with diagonal pick-marks, perhaps originally intended as a key for plaster, though it occurs on stones that seem never to have been plastered. Of solid "opus quadratum" the best existing example is the Newport arch at Lincoln, "the only complete gate of a Roman city that still survives *in situ* and in use."

For Celtic sources we must go to Ireland, which, through Iona, influenced Scotland. Here began the circular dry-built "bee-hive" dwelling or oratory—as on Skellig Michael, off Kerry. Then, in course of time, developments brought the oratory called "Gallerus" on the Dingle promontory of co. Kerry, "one of the most interesting little buildings in Europe." It has preserved its stone walls and roof for perhaps 1,200 years. The walling is laid dry, but the arched window is a development; the vault springs practically from ground level, but the oratory on St. Macdara's Island, off Connemara, has an upright wall on all four sides with gables, the latter having a pilaster-like projection at the edge in conjunction with the steep stone roof. A further development of this characteristic Irish system of encorblement brings us to the churches with double stone roofs. In the later stages was introduced the carved ornament of considerable richness in the style known as Irish Romanesque. "This work, in which a strong Norman influence mingles with the native decorative feeling, dates not earlier than about 1100, by which time the Saxon architecture with which we are at present dealing had passed away."

Professor Brown devotes a chapter to the foreign influences on later Saxon architecture. He affirms that pre-Conquest timber-work was more probably in the compact block-house style (as at Greenstead Church, Essex), and negatives the hypothesis that either Danish or earlier Saxon timber technique supplied models for Saxon stone architecture. But it is in regard to the Saxon bell tower that he makes his most important observations. This is commonly regarded as an imitation of Roman models (Professor Willis observed—"the very mid-wall shafts of the Saxon windows are directly copied from those of the Roman campanili"). Professor Brown asserts, however, that these belfry openings came not direct from Italy at an early period, but through Germany at a late period. "The proof of this is to be found in the fact that in this country the feature occurs in close connection with other features that are not Italian but are German, while it can be shown that there is an equal *a priori* likelihood of a derivation from Germany as from Italy"—which brings us to the general question of German influence on Anglo-Saxon England: this the author deals with at length, bringing to his aid, in particular, the minster at Aachen.

In Chapter III. the number, distribution and criteria of the existing monuments are fully considered, there being nearly two hundred existing churches which exhibit clear remains of Saxon masonry. The herring-bone work and long-and-short work, the Saxon pilaster strips, the window openings, arch-construction, &c., are also fully and clearly diagnosed: then follow chapters on the types of Saxon churches, the tall western tower with its turned baluster shafts, the caps and bases and other features, the book concluding with an index list of Saxon churches.

A particular interesting chapter is that on the history and theory of Saxon building based on the facts ascertained. The churches of St. Martin and St. Pancras at Canterbury; Rochester; Lyminge; Reculver; Brixworth; the crypts at Ripon and Hexham; Escomb; Monkwearmouth, Peterborough and Jarrow are assigned an early date—the seventh century—the reasons being that we do not find in them long-and-short quoins, double windows with mid-wall shafts, double-splayed lights, pilaster strips, strip-work surrounding openings, plinths, nor internally-splayed loops of a tall narrow form—the absence of these features, combined with positive indications of early date, suffice to attribute the work to the pre-Danish epoch. It might appear that a building of rude and primitive workmanship belonged to an early date, but there is no such normal social development to warrant the assumption, and, as a fact, some of the golden times of Saxon England, when the best and most ambitious work might be looked for, came at an early epoch. "Though there are monumental links between the Early Saxon building period and that of Romano-British times, the strictly architectural connection is slight. There is no evidence that any existing Saxon church was once part of a pagan Roman building. . . . Whether or not any part of a Romano-British church survive in an existing Saxon one is another question . . . . The plans of the earliest Saxon churches were partly apsidal and partly square-ended, the latter probably preponderating . . . and in technical aspects exhibit a mingling of the two traditions operative in our pre-Conquest building . . . With materials and technique that are for the most part Roman, but exhibit some Celtic peculiarities, the Saxon builder of the seventh and eighth centuries constructed the monastic and village churches. . . . So soon however as the disastrous and terrifying Danish inroads had become the predominant feature of the times the art of building must have received a check . . . Notwithstanding this, during the second or Danish period it was certainly not at a standstill, for the development of the special Saxon peculiarity of the long-and-short quoin must fall within this time . . . During the beginning of the intermediate or Danish period there was established that connection between England and Germany already noticed. . . . The third period opening with the reign of Edgar (959–975 A.D.) claims by far the greatest number of the extant monuments, and this fact gives it a proportionate importance. The same nave and chancel plan which we find at the earliest epoch remains in common use to the end of the whole Saxon period, and is then taken over as an inheritance by the Norman and mediæval builders. This normal scheme is, however, very commonly extended by the addition of a western tower, which is established in this period as a substantial feature of English church architecture; while axial towers in various positions, towers forming the body of a church, twin-towered façades, and central towers connected with the cruciform plan, or at times combined with western towers, supply interesting material to the student of architectural evolution. . . ."

This second volume is a mine of facts about Saxon architecture, illustrated by many drawings and plans, the whole brought together, discussed and compared in a manner which at once shows the author's wide experience and discriminating knowledge.

"The Arts of Early England" by G. Baldwin Brown, M.A., Watson Gordon Professor of Fine Art in the University of Edinburgh; mostly illustrated with drawings by his wife. London: Mr. John Murray, Albemarle Street, W. Two volumes, price 16s. nett each.

The Housing Problem.

In Mr. Thompson's latest work we have an excellent text-book on all matters affecting the housing of our industrial population. The author's long experience in connection with the Richmond housing schemes and other similar movements enables him to indicate the best means of overcoming those difficulties which ordinarily surround an attempt to secure a sufficiency of decent houses for the working man and his family. Many districts in our large towns contain numerous dilapidated, insanitary or overcrowded houses, which in their present condition not only prejudicially affect the moral and physical welfare of the occupants, but also constitute a grave danger to the public health. So far as single insanitary houses or very small slums are concerned, the local authorities are able to effect some improvement by compelling the several owners to repair, close or demolish such buildings, but in the case of large unhealthy areas containing old and narrow streets or alleys more drastic measures are necessarily required. The compulsory purchase and removal of large slum districts by the local authorities is frequently the only practical solution under such conditions. Similarly, the building of workmen's dwellings is oftentimes forced upon the local authorities in order to alleviate in some degree the serious house famine which has arisen.

Amongst the many instances of overcrowding to be found both in town and country, the author states that in Glasgow it was ascertained that "no less than one-fifth of the people live in one-room dwellings, and more than half the people have houses with not more than two rooms"; whilst another enquiry showed that "in 240 villages with 10,000 dwellings there were 5,000 bad cottages, and that in 30 villages gross overcrowding was prevalent." To remedy such a state of affairs is by no means an easy matter, but Mr. Thompson clearly and fully describes the various schemes which have been tried from time to time. We have details of the efforts made by co-operative societies, building societies and estate companies, together with particulars of the beneficial results obtained by such model employers of labour as Messrs. Lever and Cadbury in their well-planned villages of Port Sunlight and Bournville. Another section of the book deals with the actual cost of the demolition of insanitary areas in different parts of the country, detailed plans and estimates of the cost of artizans' dwellings, cottages and model lodging-houses as erected by municipal authorities in London, Manchester, Richmond, Nottingham, Glasgow, Liverpool, &c., being also given.

Whilst the urgent requirements of the population in our large towns receive full consideration in these pages, we are pleased to find that the pressing needs of the rural districts have not been overlooked. The descriptions of the experimental cottages which have been erected at Ixworth (Suffolk) and Penshurst (Kent) by the respective d trict councils are interesting and instructi but it is in Ireland that we find the m comprehensive measures of municipal housi being carried out.

Not the least valuable part of the bo consists of a well-arranged appendix co taining an annotated summary of the vari Working Classes Acts, regulations and laws, together with other useful memoran

Mr. Thompson has spared no pains provide a thoroughly trustworthy work reference, and one which will be of utmost value to architects, municipal gineers, builders and others who are direc concerned with the design or construction artizans' houses, whether for public or priv purposes. The book contains twenty- full-page illustrations, together with plans and diagrams of typical working-c dwellings.

which was afterwards built a *memoria* or upper chamber to serve as a small church. The tomb was situated near the wall of the Circus of Nero, and when Constantine determined to build a basilica over the spot he pulled down the circus and used the materials in the new building: a plan showing this is given in the book. The tomb formed an apsidal termination to the basilica, and over it was built an altar, in doing which, however, Constantine found it necessary to fill in the lower chamber with masonry: under the altar at the present time there is a solid belt of masonry 7ft. thick pierced by an arched recess forming the celebrated *Confessio*. Of the vicissitudes of a thousand years through which the church passed we have no space to deal, nor to give any detailed description of Old St. Peter's, almost all the exact knowledge of which comes to us from the plan by Alfarano published in 1589: for such particulars we must refer the reader to this volume, where he will find them illustrated by many ancient drawings and plans, besides a perspective of Old St. Peter's restored from ancient authorities by Mr. H. W. Brewer.

"St. Peter in Rome and his tomb on the Vatican Hill," by Arthur Stapylton Barnes, M.A., University College, Oxford, priest of the diocese of Westminster. Second edition, with a prefatory letter from Professor Lanciani. London: Swan Sonnenschein & Co., Ltd., Paternoster Square, E.C., price 10s. 6d.

A Tourist's Guide to St. Albans.

For the tourist who has a few days to pend in St. Albans this guide amply suits ts purpose. The book, however, is of a sort hat does little credit to its subject. Only he most abbreviated form of description can e given and many interesting facts and eatures have to be omitted. This defect will e appreciated when it is stated that the istory of the town is condensed into seven mall pages, while the places and buildings f interest, both ancient and modern, exclusive of the abbey and churches, are lisposed of in ten pages. The book is ertainly cheap for 4d., but that is its only recommendation. Of the illustrations, only one—of the clock tower—possesses any real merit.

"The Archer Guide to St. Albans," by B. C. Dexter. London: The Archer Printing Co., 57, Shoe Lane, E.C., price 4d.

Bricks and Mortar.

Aphorism for the Week.

> *Could be so rarely and exactly wrought,*
> *Since the true life on't was.*
> Shakespeare.

Our Plates. The house at Wolves Newton, Monmouthshire, of which Mr. A. Jessop Hardwick is the architect, stands on a beautiful site five miles from Chepstow, overlooking a view of forty miles towards Abergavenny. The surroundings are very charming. The whole of the walls are in local stone and are covered with white roughcast. The roofs are covered with Bridgwater tiles. The whole of the woodwork is oak left its natural colour. The hall has a solid oak staircase, and the walls have plain oak panelling up to a stone frieze pinned up by specially-designed bronze bosses. There is in the hall a massive carved fireplace in grey Forest stone. The billiard-, drawing- and dining-rooms are carefully designed in oak and stone, and the first has an open-timber roof with a lantern light and a large bay for sitters. The contractors for this and other works in connection with the house are Messrs. E. Turner & Sons, of Cardiff. The electric light was installed by Messrs. Alger & Sons, of Newport. Messrs. Liberty & Co. will execute the furnishing. The gardens will be laid out extensively, and a drive is being constructed around the whole of the house to the stables. The work is now nearly completed.—The late Ashmolean Museum, Oxford, was measured by Mr. W. King and Mr. Gilbert T. Gardner last summer by the aid of scaffolding erected for the purpose of restoring the balustrading, &c., at the top. The lower portion of the east front is taken from the drawing by Mr. Val Meyer in The Builders' Journal for October 2nd, 1901, when a short account was also given. The contents of this building were removed some time ago to the Taylorian Buildings, and it is now used as part of the Bodleian Library. The stonework of the cornices, architraves to first-floor windows, and the upper facework generally are in a very decayed state.

Birmingham's Municipal Art Schools. Mr. Arthur J. Gaskin has been appointed headmaster of the Vittoria Street School for Jewellers and Silversmiths, in succession to Mr. R. Catterson-Smith, recently appointed headmaster of the Birmingham Central and Branch School. The appointment was made after consultation with the representatives of the Birmingham Jewellers' and Silversmiths' Association, who cordially support the school. Mr. Gaskin was educated at the Wolverhampton Grammar School, and joined the Central School, Birmingham, in 1883, where he soon became a distinguished student, especially in drawing from the life. Since 1884 he has on two days a week been a master in the advanced classes at the Central School. Mr. Walter Crane, Mr. Gaskin and Mr. Charles M. Gere are the only other artists than Sir Edward Burne-Jones whom Morris invited to design for the Kelmscott Press. In 1893 William Morris said: "These young men of the Birmingham School of Art, Mr. Gaskin, Mr. Gere and Mr. New, have given a new start to the art of book decorating." Mr. Gaskin is a member of the Arts and Crafts Exhibition Society.

Hampstead Town Hall. The Hampstead Borough Council propose to enlarge the Town Hall, Haverstock Hill, and plans have been prepared for that purpose by Mr. John Murray, of 7, John Street, Adelphi; the total estimated cost being £9,672. The additional annual cost would represent approximately a rate of 3s. 6d. in the £, and the total annual cost (including the charge for the existing buildings) would be 3s. 8d. in the £ for the first year, and in the tenth year about 1s. 5d. in the £. Apart from the alterations and additions, considerable strengthening of the present building will have to be undertaken, owing to defective foundations, and Mr. Murray estimates that the approximate cost of this work, including new drainage and architect's and quantity surveyor's charges, will be £5,000. It is stated that in order to accommodate the present staff it has been found necessary to utilize the council-chamber and committee-rooms when these rooms are not in the occupation of the members of the Council.

Excavations in Egypt. THE last season's work of British archæologists in Egypt has been most fruitful, both in the singular beauty of many of the objects discovered and the further elucidation of a period far anterior to what a comparatively few years ago would have been regarded as the beginnings of history. The year will have been further remarkable from the convergence of the testimony of independent workers in different fields, as the investigations of Prof. Flinders Petrie in Egypt and those of Mr. Arthur Evans in Crete have been found to be mutually corroborative and to lead to new conceptions alike of Egyptian and of early Hellenic civilization. This year, as usual, the exhibition has been held in University College of the work carried on by Professor Petrie and Messrs. Grenfell & Hunt, on behalf of the Egypt Exploration Fund, its Græco-Roman branch and the Egyptian Research account. The principal work of the fund has been effected on the old Temple site of Abydos, and its unprecedented feature is that on the same site remains have been discovered of successive periods covering about 4,500 years, and beginning about 5000 B.C. The earliest temple is believed to antedate the first dynasty and the latest to be of the XXVIth. The excavation work was of almost surgical nicety in the discrimination and of scientific precision in the measurements of the remains of all these generations of mankind. The great advances made in the earliest times, in both art and manufacture, are truly astonishing. The use of glazed work on a large scale, hitherto supposed to be of late development, is shown to have been extensive even in the first dynasty. Of this age have been found bowls of diorite and quartz crystal, glazed beads and tilework, and in particular a piece of a large green glazed vase of Aha-Mena, with a name inlaid in purple, showing that polychrome glazing was already in use during the first dynasty. The ivories, too, show a surprising mastery of fine and natural work, such as, in Professor Petrie's words, "certainly cannot be rivalled by any later work in Egypt, or by very little that has been done elsewhere." The black pottery is, we are told, of non-Egyptian origin. The forms are Greek, with a long curved neck to the amphora and hollow feet to the vases. A similar quality is found in Crete of the late neolithic age. The pottery is ascribed to the first dynasty at Abydos. In the Græco-Roman branch, Mr. Grenfell and Mr. Hunt completed their excavations at Hibeh, begun in the previous year, and thence made large additions to their collection of early Ptolemaic papyri.

The Clifford's Inn Carving.—Messrs. Farebrother, Ellis & Co. last week sold the seventeenth-century woodwork and carving, ascribed to Grinling Gibbons, at No. 3, Clifford's Inn, in one lot, for 550 guineas, to Messrs. Durlacher, who were understood to be acting for the Victoria and Albert Museum, Kensington. The dimensions are, 21ft. long, 15ft. wide and 10ft. high. The lot included the great chimney-piece.

R.I.B.A. MIDSUMMER EXAMINATIONS.

Pass List.

THE Preliminary Examination, qualifying for registration as *Probationer R.I.B.A.*, was held in London and various provincial centres on June 9th and 10th: 198 candidates were admitted and 35 claims for exemption from sitting for the examination were allowed: the remaining 163 candidates were examined with the following results:—

District.	Total examined.	Passed.	Relegated.
London	82	56	26
Birmingham	9	7	2
Bristol	13	7	6
Cardiff	4	4	0
Glasgow	3	3	0
Leeds	14	11	3
Liverpool	10	8	2
Manchester	21	16	5
Newcastle	7	5	2
	163	117	46

The passed candidates, with those exempted—numbering altogether 152—have been registered as Probationers. They are:—

Final.

The Final and Special Examinations, qualifying for candidature as *Associate R.I.B.A.*, were held in London from June 26th to July 3rd. Of the 55 candidates* examined, 22 passed and the remaining 33 were relegated to their studies. The successful candidates are as follows:—

E. P. Archer (London, N.)
O. M. Ayrton* (London, W.C.)
H. A. Battley (London, S.E.)
T. J. Bee (Sidcup)
H. T. Bill (Birmingham)
H. Black (London, W.)
W. A. T. Carter (London, W.)
G. Church (Warlingham)
J. D. Clarke* (London, W.)
W. E. Couch (London, W.)
P. B. Dannatt (London, S.E.)
H. E. Davey (London, S.E.)
R. K. Gall (Aberdeen)
J. Green (Birmingham)
T. F. Green (London, N.W.)
E. M. Joseph (London, E.C.)
A. E. Lacey (Ashford, Kent)
T. E. Richards (Barry)
T. Simpson* (London, E.C.)
H. B. Smith (London, W.C.)
S. Warwick (London, W.)
R. Wylie (Gateshead)

The following table shows the number of failures in each subject of the Final Examination:—

I. Design	22
II. Mouldings and Ornament	25
III. Building Materials	13
IV. Principles of Hygiene	14
V. Specifications	11
VI. Construction: Foundations &c.	12
VII. Construction: Iron and Steel, &c.	13

---

* Six of these candidates entered for the Special Examination, which is for architects in practice not less than twenty-five years of age, and chief assistants over thirty. Such candidates are exempted by special resolution of the Council from the Preliminary and Intermediate Examinations, and from submitting "Testimonies of Study." Three of these special candidates passed; an asterisk is prefixed to their names in the above list.

Tenders.

Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, 9, *East Harding Street, E.C.*

The following companies are to be wound up:—
DERBY OXIDE AND COLOUR CO., LTD.
TRENT CONTRACT CO., LTD.

Trade and Craft.

Lifts and Cranes.

An excellent catalogue of lifts and cranes is issued by Messrs. Joseph Richmond & Co., Ltd., engineers, of 30, Kirby Street, Hatton Garden, London, E.C. The first section is devoted to photographic illustrations of electric lifts for passengers, goods and service. The two former are fitted with the "Richmond-Carey" patent controller, consisting of a series of buttons inside the car which, when pressed, set the lift in motion, so that it automatically ascends or descends to the particular floor to which the button corresponds, and stops there: similarly, on pressing a button on any floor the lift will automatically come to that floor. Each door is provided with a circuit breaker operating in the main circuit, so that the lift can only work when all the doors are shut. The second section of the catalogue is devoted to hydraulic lifts and cranes, the latter including a particularly well designed wharf crane. A third section of the catalogue deals with various handsome lift cars in wrought-iron, the "Definite" safety gear, and fire-proof tariff or compartment doors, built in accordance with the requirements of the fire insurance offices: while a fourth section illustrates a power lift designed to stand rough usage, a hand-power goods lift, the "Eccentric" patent self-sustaining dinner lift, a hand-power crane, and vertical and skidway platform hoists fitted with wrought-iron framed crabs.

Complete List of Contracts Open.

THE LONDON
OF OUR
FORE-FATHERS

is rapidly disappearing, and many picturesque bits of Old London have already been demolished to make room for modern requirements.

The following Photogravures (reproduced by the Rembrandt Process), from originals by Mr. F. L. Emanuel, form a lasting record of many of these interesting buildings.

No further copies can be published, as the plates have been destroyed, and the pictures are therefore quite unique.

Single Copies at the following Prices:—

1.	**The "Old Horse and Groom,"** Back of Holborn-above-Bar (since demolished).	6d. each.
2.	**Holywell Street,** from St. Clement Dane's Church (since demolished).	2s. 6d. each.
3.	**The "Old Bell,"** Holborn (since demolished).	1s. 6d. each.
4.	**Leather Lane,** Holborn	1s. 0d. each.
5.	**Davies Street** (since demolished).	9d. each.
6.	**Fetter Lane,** View from Holborn.	6d. each.
